INDEX OF CONTENTS.

JULY TO DECEMBER, 1893.

A

ABDERLEY Hall Gardens, 713
 Abies Alcockiana, 340
 Abutilon vitifolium album, 783, 808
 Acacia, hybridisation of, 249
 Acanthoriza aculeata, 98
 Achillea, The Pearl, 554
 Achimenes longiflora, 104; new variety of, 132
 Acorn crop, the, 401
 Acorn, poisoning by, 434
 Ageratum, Bijou de Lyon, 163
 Agaricus phalloides, 361
 Agave potatorum, 743
 Agricultural Hall, show at, 242, 368
 Agricultural returns, 1893 657
 Ailanthuses, cut-back, 188
 Albumen in plants, 530
 Aleppo, Liquorice and Orange culture in, 97
 Allotment gardening, 129
 Allotments, 186, 725, 784, 809
 Allotments in parishes, 688
 Alonsoa linifolia, 428; A. Warscewiczii compacta, 428
 Alpine garden, a new, 160
 Amaryllis Belladonna, 371, 468, 554 596
 Amelanchier canadensis, 423; A. var. oblongifolia, 137
 American Coniferous forests, 209, 558
 American parks and gardens, 429, 502, 552, 585, 684
 American Turpentine Tree, the wood of, 334
 Ames, F. L., 434
 Ampelopsis Veitchii var. purpurea, 492
 Amygdalus nana, 275
 Anastatica hierochuntina, 769
 André, M. Edouard, 306
 Anemone hortensis, fungus on tuber of, 75
 Anemone sylvestris, the active principle of, 98
 Anemoneopsis macrophylla, 132
 Angraecum O'Brienianum, 300
 Anthracnose of the Vine, 33
 Anthurium, hybrid, 216, 275; A. Wambeckianum, 557
 Antibes, notes from, 299
 Antigua Botanic station, 180
 Antwerp Exposition Universelle, 497, 721
 Aphelexis, culture of, 685
 Apiary, the, 37, 95, 213, 303, 440, 527, 687
 Apple, a heavy, 245 439; Baldwin, 559; Bedfordshire Foundling, 426; Cornish Gilliflower, 622, 684; Cox's Pomona, 622; culture for farmers, 156; Ecklinville Seedling, 622; Emperor Alexander, 426 499; Graham's Royal Jubilee, 426, 463; Hambling's, Seedling, 534; Stirling Castle, early bearing of, 404; trees, premature flowering of, 404; Peasegood's Nonsuch, large specimen of, 308
 Apples and Pears, the keeping of, 533, 753; a use for wind-fallen, 309; rearing of, from seed, 151; second crop of, 532

Apricots, standard, ripening their fruits, 162
 Arabia, collecting in south, 651
 Arachnanthe Clarkei, 713; A. Lowii, 264
 Aralia canescens, 302
 Aranja sericifera, 436
 Arbutus Unedo at Balcarres, 329
 Architects and landscape gardeners, 130, 130
 Aristolochia gigas, 190
 Arsenites as Insecticides, 807
 Art and botany, 138
 Asa Gray, the letters of, 722, 781
 Ash tree ready for removal, 87
 Asparagus in Lanarkshire, 309
 Aster puniceus pulcherrimus, 468
 Aster the Comet, 629; Webb's White Queen, 361
 Asters at Chiswick, 333
 Attar of Roses, the production of, 99
 Auricula, the, 59, 747
 Austrian Briars, the, 328
 Azalea indica, growth and culture of, 34, 59
 Azolla filiculoides, 42; in fruit, 209; pinnata (by error) 15

B

BACTERIA, the chemistry of, 522
 Bailey, Professor L. H., retirement of, 658
 Balata industry at Paramaribo, 7 22
 Baltet, Mr. Chas., 306
 Bananas in Costa Rica, 138
 Banksia collina, 744
 Barham Court, fruit at, 207
 Barkeria Lindleyana, 649
 Barkerias from Highbury, 712
 Baroda House, Water Lilies at, 301
 Batavian Endive, 533
 Bean, the Asparagus, 424; the Lima, 424, 621; the Soy, 424
 Beans, late Scarlet Runner, 725
 Bear Park, Wensleydale, 8
 Bedding in Hyde Park, 183; plants for summer, 652; with yellow flowers, 469
 Bee-keeping, technical lectures on, 590
 Begonia, Gloire de Sceaux, 66; B. Tweedieana, 438
 Begonias, bedding, 245
 Belgian and English gardeners, 753, 784
 Belgium and in England, Orchid culture in, 650, 784
 Belvedere, notes from, 619; Orchids at, 297
 Benefit and Provident Society, United Horticultural, 66, 467, 500
 Benevolent Institution, Gardeners' Royal, 16, 66
 Berlin letter, 800
 Bignonia Cherere, 438
 Birnrock Gardens, Dundee, 63
 Birmingham Botanic Gardens, 502, 723
 Bletchley Park, 534
 Bietia Shepherdii, 261
 Bones, as crocking for Chrysanthemums, 13, 16; as drainage for Chrysanthemums, 42

BOOKS, NOTICES OF:—Art out-of-doors (Mrs. Schuyler van Rensselaer), 496; Biographical Index of British and Irish Botanists (Jas. Britten and G. S. Boulger), 345; Birds of Michigan, 722; Book of Choice Ferns, 40; Botanical Magazine, 98, 336, 465, 594, 751; British Flies (F. V. Theobald), 160; British Fungi, 337; British Fungus Flora (Geo. Massee), vols. ii., iii., 774; Bulbs and Tuberos-rooted Plants (C. L. Allen), 627; A Companion for the Queensland Student of Plant-life (F. M. Bailey), 402; Cottage Gardening, 627; Cottagers' Manual of Poultry-keeping (W. B. Tegetmeier), 774; Dendrobiums, a Synopsis of (H. J. Solmans), 465; Deutsche Dendrologie (Dr. Emil Kuhn), 274; Dictionary of Birds (Prof. Newton), 273, 530; Dictionnaire Pratique d'Horticulture, 130, 337, 721; Die Natürlichen Pflanzenfamilien, 337; Elementary Text-book of Agricultural Botany (M. C. Potter), 724; Elements de Botanique Agricole (E. Schribaux et J. Nanot), 721; Figures with Descriptions of Extra Tropical South African Orchids (H. Bolus, F. L. S.), 402; Flora Australiensis, 160; Flora Brasiliensis, vol. xiii., Part 3. Orchidaceæ (Alfred Cogniaux), 238; Flora of British India, 370; Flora of Kent (A. D. Webster), 721; Handbook of the Destructive Insects of Victoria (C. French), 530; Handbook of Flora of New South Wales (Chas. Moore, F. R. S.), 165; Hooker's Icones Plantarum, 529; Hygiene, Essays on Rural Hygiene (G. V. Poore), 615; Index Kewensis, 304, 779; Irises, bulbous (Prof. Michael Foster), 14; Jamaica, Flora of (Wm. Fawcett), 498; Johnson's Gardeners' Dictionary, 130, 531; Journal des Orchidées, 807; Journal of Mycology, 129; Journal of the Royal Horticultural Society, 272; Journal of Universal Information (Ed. Curtice), 808; Kew Bulletin, The, 169, 336, 432; Labour, A New Chapter in the History of (Keith), 594; La Fumure des Champs et dea Jardina (L. Grandcau), 219; Le Petit Jardin, 781; L'Horticulture Française (M. Ch. Baltet), 130; Lindenia, the, 466; Manuel de Géographie Botanique (M. Georges Poirault), 721; Mechanical Work in Garden and Greenhouse (Francis Chilton Young), 165; Meehan's Monthly, 789; Orchid Review, the, 97, 466, 627, 752; Plant-atlas to my Water-cure (Sebastian Knipp), 165; Poultry for the Table and Market (W. B. Tegetmeier), 40; Revision des Champignons dans les Pays-Bas (Prof. Oudemans), 774; Revue de Viticulture, 780; Romance of Low Life amongst Plants (M. C. Cooke), 774; Semer et Planter (D. Cannon), 219; Shrubs of North-

Eastern America (C. S. Newhall), 529; Species and Varieties of the genus Acer (Fritz Graf Von Schwerin), 807; Sylva of North America, 690, 720; (C. S. Sargent), The Orchards: Fruit Culture for Small Holdings (J. Cranston), 436; Thistle common in Australia (Baron Sir Ferd. von Mueller), 337; The Grasses of the Pacific Slope, 189; Vine and its Culture, the, 807; Vorläufige Nachricht von Einigen das Geschlecht der Pflanzen betreffenden Versuchen und Beobachtungen (Kolreuter), 130; Work of the Soil and its Nitrification (P. P. Vichérain) 268

Bordeaux Mixture, formula for making the, 12

Boronias, culture of, 558
 Botanic Gardens, Birmingham, 723
 Botanic station, Antigua, 180
 Botanic stations, 208; in the colonies, 151
 Botanical Magazine dedicated to Mr. Hanbury, 807
 Botany and art, 138
 Bougainvillea glabra, flowering out-of-doors, 726
 Braessica show, a, 725
 Briars, the Austrian, 328
 Bricklehampton Hall, 802
 Bridal bouquets at the royal wedding, 39
 British Guiana, tropical gardening in, 337
 Broccoli, heeling-in, 754
 Brownea Crawfordii at Kew, 627
 Brownleea caerulea, 188
 Buckingham Palace, the decorations at, 39
 Bud-moth, the, 434
 Buds, the individuality of Chrysanthemum, 592
 Buenos Ayres, 658
 Bulb and seed trade employés, 691, 785, 808
 Balbophyllum hirtum, 712
 Burvenich, M. Honour for, 807

C

CALANTHE BELLA, 235; C. Burfordiensis, 235; C. × Victoria, 235
 Calathea allouya, 97
 Calcutta, Royal Botanic Gardens, 307
 California, Ferns and Begonias in, 472; fruit-growing in, 722
 Californian fruit, 338
 Californian Poppy, 752
 Calla, the rose-coloured, 658, 659
 Calpurnia aurea, 750
 Camellia in the open air at Osborne, 401
 Camellia reticulata at Hong Kong, 523
 Campanula excelsa, 307; C. lactiflora, 24
 Campanulas, eaten by dog, 68
 Camphor trade in Formosa, 94
 Canna, Queen Charlotte, 658
 Cannas, a paper by Mr. Geo. Paul, on 647
 Cannas, new dwarf, 189; C., proposed classification of, 432
 Cannes, the gardens at, 629
 Cannon, Mr. Geo., 467, 721
 Cape Gooseberry, the, 424

- Cape, the flower trade of the, 129
 Capsicum, the, 424
 Caraccas, Cedar-wood in, 14
 Carbon, bisulphide of, 807
 Cardiff, Botanic Garden for, 721
 Cardiff Castle Gardens, 295
 Carnation. Mrs. Leopold de Rothschild, 295
 Carnation, Souvenir de la Malmaison, 800
 Carnation and Picotee, the, 154
 Carnations, 129, 524, 747
 Carnations one hundred years ago, 190
 Casimiroa edulis, 393
 Catalpa speciosa, 216
 Cattleya amethystoglossa, var. rosea, 35; C. × Chloris, 525; C. citrina, 425; C. granulosa Dubuyssonii, 150; C. Gaskelliana, 404; C. × Hardyana, 298; C. Hardyana × Statter's form, 35; C. labiata, 490; C. labiata var. 584, 742; C. labiata Gaskelliana, 99; C. Leopoldi, 130; C. Mendeli, Quorndon-house var., 235; C. Mossiae, var. Mendeli, 35; C. Parthenia ×, 713; C. velutina, 712
 Cedar-wood in Caraccas, 14
 Celeriac, 424
 Celsia cretica, 301
 Centropogon Lucyanus, 744
 Cercidiphyllum japonicum, 137
 Cereus grandiflorus, 186, 245
 Chemistry, abstract of a lesson in agricultural, by Prof. W. O. Atwater, 797
 Chenopodium bonus-Henrycus, 424
 Cherkley Court, fire at, 131; rebuilding of, 562
 Chervil, the turnip-rooted, 424
 Chicago Exhibition, 119, 266, 501; Chrysanthemums at, 716
 Chicago, horticultural congress at, 242
 Chilian Strawberries, 683
 China, frost in, 13; vegetable products in, 365
 Chionodoxa Alleni, 404
 Chiswick, Asters at, 333; notes from, 152, 457, 553, 587; Phloxes at, 128; Sweet Peas at, 13
 Chiswick, variegated Iviea at, 802
 Chiswick show, the, 66
 Chorizemas, the culture of, 771
 Christmas, flowers and fruit for, 778
 Christmas trees, the trade in, 754
 Chrysanthemum buds, the individuality of, 592
 Chrysanthemum Exhibitions, how to improve, 584, 660, 726
 Chrysanthemum growers' terms, 592, 620
 Chrysanthemum Gustave Grunerwald, 328; Lady Fitz vygram, 240; Madame Thérèse Rey, 718; Mrs. Alpheus Hardy, 691; season, the, 158, 560; season, prospects of the, 524; sports, 567; white Louis Biehrer, 718; verses on the, 602
 Chrysanthemums, 155, 404, 658; at Chicago, 716; about London, 531, 563, 586, 619, 713; anemone-flowered, 718; expanding show-boards for, 754; for cutting, 808; in the conservatory, 397; select decorative, 776; stopping, 747; taking the buds of, 716; treatment of, 396
 Chrysogonum virginianum, 404
 Chufa, the, or Rush-nut, 424
 Cigarette smoking in Persia, 392
 Cirrhopetalum ornaticissimum, 553
 Cistus, the genus, 88
 Citrus and deciduous trees from seeds, 458
 Citrus trifoliata, 556, 625
 Clematis, a hybrid, 242, 275
 Clematis graveolens, 435
 Clematites, sweet-scented, 208
 Clethra alnifolia, 494; C. tomentosa, 302
 Cliveia miniata var. Miss Alice Rodigas, 150
 Club, Botanical Exchange, 401
 Cockscomb Veauvius, 715
 Coddling in gardening, 437
 Coffee growing in Java, 64
 Cœlogyne pandurata, 235
 Coleus tuberosus, 183
 Colletia bictonenis, 438
 Colocasia antiquorum, 207; C. eculenta, 207
 Colonial notes, 300
 Coloured foliage, 754
 Colouring of flowers and fruits, artificial, 779
 Colutea arborescens, 398
 Combermere Abbey, 14
 Commerson's monument in Mauritius, 648
 Commons, an end to unlawful enclosure of, 400
 Conifer forests in America, 209, 558
 Conifers and Taxads, 456
 Conifers, blue, 275
 Conifers, the rate of growth of, 438; the resin of, 327
 Continent, a journey on the, 87
 Continental novelties, 715
 Cornus Spathi, 166
 Coryanthes Wolthi, 424
 Cosmos bipinnatus, 596
 Costus igneus, 627
 County Council Horticulture in Norfolk, 753
 Cover, Symmes' vegetable-, 403
 Crinum Kirkii, 69
 Cocks to prevent the ingress of worms, 273
 Crotalaria longirostrata, 98
 Cucumber culture, 772
 Cucumber diseases, 137
 Cucumber tendrils, 161
 Cupressus macrocarpa var. lutea, 188
 Currant, Red, a new large, 39; the Crandall, 137
 Cyclamens hardy, 300
 Cydonias, 682
 Cymbidium eburneum, 264; C. grandiflorum var. punctatum, 524; C. Lowianum, 425; C. L. var. superbissima, 524
 Cyperus esculentus, 424
 Cypripedium × Iaothe, 742; C. insignis Sanderæ, 490; C. Leeanum, 584; C. L. var. gigantea, 235; C. × L. varieties, 712; C. × Massalianum, 267; C. Niobe, 742; C. × Schroderæ, 683; C. sport, do., 753; C. × Tennyson, 683; C. × venustospicerianum, 742
 Cypripediums, raising new varieties of, 42; sporting of, 809
 Cyrtanthus helictus, 69
 Cytisus elongatus, 435
- D
- DABOECIA polifolia, 240
 Daffodils, 401
 Dahlia Paragon, 365; the origin of, 438
 Dahlias, 155; new varieties of, 364
 Damage to trees at Dropmore, 753
 Dampsha Melon, 340
 Date-Palm, a new, 299
 Davenham Bank, notes from, 240
 Decorations, floral, 770
 Dendrobium Dalhousieanum and allied species, 33; D. densiflorum, 122; D. fimbriatum oculatum, 96; D. Johnsoniæ, 235; D. Phalanopsis Schroderianum, 458, 490; D. P. Rothschildianum, 524; D. P. Statterianum, 458; D. superbiens, 712
 Derby, a horticultural society for, 66
 Dentzia gracilis, 184; D. parviflora, 152
 Dianthus gallicus, 360
 Dibdin House, Orchids at, 684
 Dictamnus gigantea, 458
 Didymocarpus lacunosa, 211
 Dimorphanthus mandshuricus, 492
 Diospyros Kaki at Kew, 682
 Dichidia Kaillesiana, 366
 Dolichos sesquipedalis, 424
 Dominica botanic station, 152
 Doryanthes Guilfoylei, 160
 Dragons blood, 188
 Dressing, a winter, 565
 Dropmore, damage to trees at, 753
 Dropsy in the Tomato, 138
 Drought and watering, 42
 Drought-enduring flowers, 341
 Drought, the great, 753
- E
- EARL'S Court, Forestry at, 459; prize money at, 754, 784
 Earwigs on lawns, 42
 Economic plants in Tahiti, 269
 Edelweiss, the sham, 273, 306
 Edenhall, Penrith, 403
 Education in horticulture, 728; in horticulture, technical, 408; in gardening, 720
 Egg-plant, the purple, 424
 Elæagnus macrophyllus, 654
 Electric light and vegetation, 273, 394
 Emigration, 39
 Endive, Batavian, 564
 Epidendrum pusillum, 121
 Epilobium latifolium, 56
 Ericas, the culture of, 492
 Escallonia Phillipiana, 60
 Eucalyptus, and the Times, 104
 Eucharis, the, 200
 Eucryphia pinnatifolia, 165
 Eulophia Elisabethæ, how it was obtained, 14, 556
 Europe with foreign plants, the peopling of, 210
 Events of 1893, 804
 Examinations in horticulture, 14; of the Royal Horticultural Society, 104

SALES BY AUCTION.

FRIDAY NEXT, JULY 7.

GREAT ORCHID SALE.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY NEXT, July 7, at half-past 12 o'clock, the largest and most valuable lot of IMPORTED and ESTABLISHED ORCHIDS ever offered in one day's Sale.

DENDROBIUM PHALLENOPSIS SCHRODERIANUM, THE KING OF THE DENDROBES. THE REMAINING PORTION OF OUR RECENT SPLENDID IMPORTATION.

This is, without doubt, the very best time to import this gorgeous Dendrobe. The Plants offered are in grand order, and will produce masses of blooms of every shade of pink, purple, crimson, rose, and white; as many as 20 to 30 flowers on a single inflorescence. Each flower is as big as a Phalenopsis amabilis.

THE NEW AND SENSATIONAL EULOPHIELLA ELISABETHLE. In superb order. Plants breaking freely. We hold the entire stock, and guarantee every plant. Mr. R. A. ROLFE, of the Royal Gardens, Kew, the author and founder of this new genus, has examined our plants, and certified them true.

Among the other new and splendid introductions offered, are:—The truly marvellous—HABENARIA GIGANTEA VAR. SUMATRANA (SYN. H. SUSANNE VAR. SUMATRANA).

A New and Handsome ONCIDIUM from VENEZUELA (Provisionally named SANDERIANUM). Bearing hundreds of rosy-red flowers, Pescatorei-shaped, in veritable bouquets.

A distinct-looking and probably New CATTLEYA from beyond BOLIVAR, section of C. Mossie.

The new and striking CYPRIPEDIUM NICHOLSONIANUM, from the Island of Palawan; spike many-flowered; section of Rothschildianum and Sanderianum. An ODONTOGLOSSUM sent home as WATTIANUM, but may be new; a PHALUS from Madagascar, with Lachia-like blooms; a BULBOPHYLLUM from Madagascar, discovered by M. Hamelin; also NEW ANGRECUMS, and other Madagascan ORCHIDS.

Also a splendid Plant of the exquisite lemon-yellow and white CYPRIPEDIUM INSIGNE SANDERIE, For beauty unapproached and unapproachable.

CATTLEYA MENDELII BLUNTII, The finest white Mendelii in existence. CATTLEYA LARIATA ALBA. CATTLEYA SPECIOSISSIMA ALBA. CATTLEYA ACLANDIE ALBA, &c. Every plant is guaranteed true to name and description. By order, F. SANDER AND CO., St. Albans. On view morning of Sale, and catalogues had.

Tuesday Next. FIFTY ESTABLISHED ONLY. RARE AND FIRST-CLASS ORCHIDS.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on TUESDAY, July 4, at half-past 12 o'clock precisely, the above 50 rare and first class ORCHIDS. Amongst them will be found:—TRICHOPLIA SUAVIS ALBA, with 7 bulbs, 4 leaves, 2 leads.

DENDROBIUM SCHRODERIANUM (DENSIFLORUM ALBUM).

MASDEVALLIA SCHRODERIE, F.C.C.R.H.S. with 9 leaves. CYPRIPEDIUM ARGUS MOENSEL.

CATTLEYA INTERMEDIA ALBA, very fine, healthy plant. CATTLEYA WALLISII, the white form of the El-Dorado Cattleya.

VANDA (RENANTHERA) STOREI, a fine specimen. SOERALIA BEYERIANA (New), only two plants of this are in culture; the nearest ally is S. Lucasiana.

ANGRECEM DUBUYSSONI, fine plant, with two growths. VANDA TRICOLOR CINNAMOMEA, with 8 pairs of leaves. PLEUROTHALIS ROZZELLI, the finest of the genus.

MASDEVALLIA DAYANA, the Window-bearing Orchid; fine plants, with 12 leaves.

LELIA ANCEPS STELLA.

" " DAWSONI.

" " SANDERIANA.

" " PROTHEROEANA, &c. On view morning of Sale, and Catalogues had.

Tuesday Next, July 11. An Importation of 1000 ODONTOGLOSSUM ALEXANDRE, of the finest Carlierian type. Every plant in good health, just commencing their growths, a number already rooting freely. They will be sold in boxes to prevent injury to the growths and roots.

MESSRS. PROTHEROE AND MORRIS will SELL the above by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on TUESDAY, July 11, at half-past 12 o'clock. On view morning of Sale, and Catalogues had.

Tuesday Next, July 4. By order of Messrs. Walter Kemsley & Co. 500 PHALLENOPSIS GRANDIFLORA. For Unreserved Sale.

MESSRS. PROTHEROE AND MORRIS will include the above in their SALE on TUESDAY NEXT, July 4. On view morning of Sale, and Catalogues had.

Tuesday Next. IMPORTED ORCHIDS.

In splendid condition.

- *CYMRIDIUM DEVONIANUM. CYMELIUM EBURNEUM. CYMBIDIUM MASTERSII. VANDA CERULEA. NEW PHALUS. VANDA CATHCARTII. VANDA SPECIES. PLEIONE, NEW. DENDROBIUM NOBILE.

* This has not been imported since its first discovery by Mr. Gibson in 1837.

† From a district where the thermometer falls to 25°. MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on TUESDAY NEXT, July 4, at half-past 12 o'clock, the above-named grand IMPORTATIONS of various Species, collected and brought home by the personal care of Mr. Massman. On view morning of Sale, and Catalogues had.

Tuesday Next. A Consignment just to hand consisting of 100 SACCOLARIUM GUTTATUM. 100 DENDROBIUM WURDEANUM. 101 " NOBILE. 100 VANDA ROXBURGHII. In fine condition.

MESSRS. PROTHEROE AND MORRIS will SELL the above by AUCTION, at their Rooms, on TUESDAY NEXT, July 4, at half-past 12 o'clock. On view morning of Sale, and Catalogues had.

Friday Next. CATTLEYA HARDYANA VAR. LAVERSIANA, with three flowers, named by Mr. O'Brien, and described in 'Gardeners' Chronicle.

MESSRS. PROTHEROE AND MORRIS will include this magnificent Plant in their ORCHID SALE on FRIDAY NEXT, July 7. On view morning of Sale.

Friday, July 14. Important Consignment of PALM SEEDS. 32,000 KENTIA BELMOREANA. 141,500 " FOSTERIANA. 8,000 " CANTERBURYANA. 273,000 ARAUCARIA EXCELISA. 170 Clumps of TODEA MOOREANA.

MESSRS. PROTHEROE AND MORRIS will SELL the above by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY, July 14, at half-past 12 o'clock.

Thursday, July 13. Two cases of CYPRIPEDIUM SPECIES, ORCHIDS IN FLOWER, &c.

GREAT ORCHID SALE.

FRIDAY, JULY 7, 1893, at

MESSRS. PROTHEROE & MORRIS' ROOMS,

67 and 68, CHEAPSIDE, E.C.

The Largest and Most Valuable Lot of Imported and Established Orchids ever offered by Auction in One Day's Sale.

DENDROBIUM PHALÆNOPSIS SCHRODERIANUM

(THE KING OF THE DENDROBES).

The remaining portion of our recent splendid lot of imported plants. This is unquestionably the very best time to import this gorgeous Dendrobe. Plants are in simply grand order, with plump dormant eyes, and will produce masses of blossoms of all shades of pink, crimson, purple, rose, and white, in long arching racemes, with upwards of twenty flowers on a single spray. The flowers are as large as *Phalænopsis amabilis*, lasting two months in perfection. For sprays, bouquets, table and all other decorations, this Dendrobe is unrivalled.

THE NEW AND SENSATIONAL EULOPHIELLA ELISABETHÆ.

Plants in superb order, growing freely.

We acquired the entire stock, and guarantee every plant true to name.

Mr. R. A. ROLFE, of the Royal Gardens, Kew, the author and creator of this new genus, has examined our plants and certified them true.

The Gardeners' Chronicle says:—"It was decidedly one of the most remarkable Orchids, if not the most remarkable plant, in the last Ghent International Exhibition.

Mr. W. WATSON says:—"This is a plant of extraordinary interest and beauty, with white flowers, a yellow lip, and rich crimson-purple scapes.

The Gardening World says:—"It took the Orchid fancy immensely. Orchid-growers went into raptures over this lovely novelty."

The Gardeners' Chronicle says:—"The flowers are as large as those of *Odontoglossum citrosimum*, white, with the outer surface purplish-red, callus of the lip orange-yellow. We earnestly recommend to purchasers this very free-growing and truly magnificent new Orchid.

* * * To avoid useless correspondence, M. HAMELIN desires us to state that every plant saved of his entire importations are in our hands, and no plants can be acquired elsewhere, or from any other source whatever, and this we can fully guarantee.

Many New and Splendid Introductions will be included,

AMONG OTHERS—

The truly marvellous fringed *HABENARIA GIGANTEA* VAR. *SUMATRANA* (syn. *H. Susanne* var. *Sumatrana*).

A new and gorgeous *ONCIDIUM* from Venezuela (provisionally named *O. Sanderianum*), bearing hundreds of rosy-red flowers in bouquets.

A distinct-looking and probably NEW *CATTLEYA* from Bolivar, in the section of *Mossie*. Our Collector, who came home with the plants, declares this *Cattleya* to be new.

The new and splendid *CYPRIPEDIUM NICHOLSONIANUM* from the Island of Palawan. Spikes many-flowered. Section of *Rothschildianum* and *Sanderianum*. A grand new introduction.

A fine lot of *ODONTOGLOSSUM WATTIANUM* (?), or a new one with large inflorescences.

A new *PHAJUS* from Madagascar, with large *Lælia*-like flowers. A new *VANDA* from New Guinea, with red and mauve flowers. The new *BULBOPHYLLUM HAMELINII*, new *ANGRÆCUMS*, *GRAMMATOPHYLLUMS*, &c., &c. Together with—

CATTLEYA MENDELII BLUNTII, the finest white *Mendelii* in existence.

C. SPECIOSISSIMA ALBA, magnificent var.

C. LABIATA ALBA, true white *labiata*.

C. ACLANDIÆ ALBA, unique and fine.

And a Splendid plant of the Unapproached and Unapproachable

CYPRIPEDIUM INSIGNE SANDERÆ.

Every Plant offered is guaranteed true to name and description.

F. SANDER & CO., ST. ALBANS.

THE

Gardeners' Chronicle.

SATURDAY, JULY 1, 1893.

PIERRE POIVRE (1719—1786).

THIS naturalist was born in August, 1719, at Lyons, where his father was engaged in business and commerce. Like many of his famous contemporaries, he owed his training to a religious community, having been educated by the missionaries of Saint Joseph, the Superior of whom was a friend of his family. The Jesuits, hearing of the great aptitude of young Poivre, attempted by means of the Archbishop, M. de Rochebonne, to persuade him to join their college; but the missionaries prevented this, and he was sent to finish his education at Paris, in the Congregation of Foreign Missions, where he also distinguished himself.

Although going through the course of instruction prescribed for Catechumens, he did not devote his whole time to philosophy and theology, but successfully applied himself to drawing and painting as a relaxation, and also as a means of information in the foreign countries which he meant to visit. He was first despatched as a missionary to China, and soon after his arrival, having been denounced as a dangerous foreigner, was imprisoned by the authorities at Canton. The viceroy of the province of Quantung, however, was soon convinced of his innocence, and afforded him his protection, and under his powerful influence, Poivre was enabled to procure all the facilities for seeing the interior of the country, which were not easily procurable by foreigners.

After two years' residence in South China, Poivre accompanied the French missionaries to Cochin China, where he spent two more years, returning again to Canton, where he remained in great favour with the Chinese viceroy for some years. Unfortunately, no exact dates of these occurrences are given by M. Dupont de Nemours, his biographer; nor, indeed, are any of these dates to be found in the notice of Poivre's career given in the latest edition of the *Biographie Universelle*.

In 1745, M. Poivre returned to France, in order to visit his family, and also to take holy orders. He embarked at Macao on board the *Dauphin*, which was attacked in the Straits of Banca by an English frigate of superior strength, one of a squadron under Admiral Barnet, whose flag was on the *Deptford*. M. Poivre fought among his countrymen, and was zealous in attending to the wounded on deck until he was struck on the wrist by a round shot, which shattered his arm. His first words, as soon as he could speak, were, "Je ne pourrai plus peindre" ("I shall not be able to paint any more!"). Shortly after he fell, the ship was taken, and poor Poivre was placed in the hold, where he remained twenty-four hours without his wound being attended to. Gangrene supervened, and his arm was subsequently removed by an English surgeon. Curiously enough, this grave injury was, in the

and, a blessing, as it prevented Poivre from entering the Church, and enabled him to become a famous administrator, and to enjoy all the happiness of a married life, and the pleasures of a family man.

Unfortunately for science, his journal and a large number of valuable drawings which he had made in China fell into the hands of the English, and were never recovered. Perchance these interesting manuscripts are still somewhere buried in the archives of the Admiralty, unless, like so many other valuable documents in our public offices, they have been "pulped," and destroyed as waste paper—a fate which has befallen many tons of interesting records in our benighted country.

The English captors being short of provisions, landed their prisoners at Batavia, and set them free. Poivre made use of his enforced stay at the capital of the Dutch East Indian establishments to study and gain all the information possible on the culture of the precious spice trees, the plantations of which were at that period exclusively in the hands of the Dutchmen. This gave him the idea, which he afterwards realised, of enriching the tropical colonies of his own country by the introduction of spice cultivation. From Batavia, Poivre proceeded to Mergui in Siam, where he spent the winter, and thence made his way to Pondichéry. The vessel in which he made the voyage was ill-found and badly manned, consequently, it had to be constantly taken into various ports *en route*, and during these enforced intervals, Poivre had the opportunity of making himself accurately acquainted with the manners and customs of the Malay people and of the Siamese. Although only twenty-seven years of age, he had already learnt how to judge of the welfare and progress of races by the state of their agriculture.

On arrival at Pondichéry, Poivre found himself in the midst of the complications arising from the brilliant expedition of Madras, and the consequent quarrels between Dupleix and De Labourdonnais. He divided the blame equally between these two famous chiefs, otherwise so able and illustrious, and in vain attempted to bring about a reconciliation. He accompanied De Labourdonnais to the Isle of France, and afterwards to the Cape and Martinique, where their vessel was detained by the war for want of convoy. Poivre, however, who was anxious to place in the hands of the French Government some important information which he had acquired in the East Indies, crossed in a canoe to the island of St. Eustache, where he obtained a passage to Europe in a Dutch vessel. However, misfortune seemed to pursue him, for he was again captured by a corsair, which was retaken four days afterwards by an English frigate, which landed him at Guernsey, where he remained about a week, when the signing of the peace enabled him to return home.

The curious observations and the grand ideas which Poivre brought back from Asia, together with the perfection of his Chinese, Cochinchinese, and Malay languages, soon brought him to the notice of the French East India Company (*La Compagnie des Indes*), and he was selected in the year 1719 to represent France as Minister in Cochinchina. The King of Cochinchina, surprised to find a young French Minister at his court with whom he could converse in his own language, became very friendly and intimate, so that he was enabled successfully to combat all the intrigues and manoeuvres of the crafty mandarins who formed the court of the despotic sovereign. Poivre returned to the Isle of France laden with rich presents from the Oriental despot, but he religiously handed them all over to the French authorities.

During his stay in Cochinchina, Poivre had taken immense pains to collect the most useful and economical plants, which he judged could be introduced and naturalised in the Isles of France and Bourbon. He brought these, and acclimatised, amongst others, the Pepper (*Piper nigrum*), a wild kind of which, *Piper sylvestre*, was known to occur in Madagascar and Mauritius; the Cinnamon (*Laurus cinnamomum*), the Litchi (*Euphoria Litchi*), the

Jack-fruit (*Artocarpus integrifolia*), besides several species of dye woods, and trees producing gums, resins, and varnish. The most precious, however, of all the plants which he introduced to the Mascarenes is the dry Rice, which was extensively cultivated by the Cochinchinese on mountain lands, at a considerable elevation, in a comparatively moderate temperature, and not requiring irrigation. Several crops of this species of Rice are obtainable, and it was successful in Mauritius as long as M. Poivre remained in the island; but after his death (according to his biographer) the cultivation of this sort of Rice was neglected, and left to the negroes and slaves, who watered it as the ordinary rice fields, so that this description, which might have become a valuable article of food in the Mascarene Islands, was allowed to die out.

The biographer advises the colonists in the Isle of France to send to Cochinchina, and reintroduce the *Riz sec* to the colony. Shortly afterwards, M. Poivre was sent by the company to Manilla on a secret mission. His instructions obliged him to keep the object of his mission secret, even from the

FIG. 1.—FLOWERS IN ICE.

employés of the company at Canton, where he passed on his way—although, as it subsequently appeared, these same officials had learnt the secret orders through another channel. In consequence of his reticence, these jealous officials put all sorts of malicious obstacles in his way, and it needed all his energy to carry out his task, which he could only accomplish partly owing to the machinations of his enemies. He was obliged to return to Pondichéry and the Isle of France, but not before he had established friendly relations with the Spaniards and with the natives of the Philippines, with whom he came in contact; and he at all events paved the way for a second happier and more successful visit. This journey was undertaken with the main object of acquiring and naturalising in the Mascarene Islands the finer and rarer species of spice trees, which were then almost wholly monopolised by the Dutch in Java and the Moluccas. *S. Pasfield Oliver, Captain late Royal Artillery, Anglesey, Gosport.*

(To be continued.)

NEW OR NOTEWORTHY PLANTS.

LILIUM CROCEO-ELEGANS.

MR. SPRENGER, of the firm of Messrs. Dammann & Co. of Naples, has lately been experimenting in the hybridisation of Lilies, and I am indebted to him for fine specimens of one of the crosses he has been successful in obtaining between the European cro-

ceum and the Japanese elegans (*Thunbergianum*). The robust stem reaches a height of above 2 feet; the leaves are shorter and broader than is usual in croceum, the lowest being lanceolate, 2 or 3 inches long, without any bulbillæ in their axils; the inflorescence is a lax corymb of six or eight flowers, with cottony peduncles and small ovate bracts, and the flower is 3 inches long, inside light or deep scarlet, with copious small black dots, and many raised papillæ towards the base, with outer segments under an inch, and inner a little over an inch broad at the middle. This hybrid is a fine plant for decorative purposes, and is interesting in throwing light upon the origin of *L. umbellatum*, Link, which is known in cultivation only, and is probably a hybrid between croceum and *davuricum*. *J. G. Baker.*

FLOWERS IN ICE.

At a recent meeting of the Royal Horticultural Society, much interest was excited by the exhibition on the part of E. Herbert Fison, Esq., of Ipswich, of several truncated cones of ice in which were embedded various flowers. Each block of ice measured about 16 inches in height, and the enclosed flowers were those of common New Zealand plants. We need hardly say how much more acceptable they were than similar consignments containing *Chrysanthemum*, of which we see enough during the winter season. Among the flowers which showed to most advantage were those of *Callistemon*, *Cordylina australis*, *Leptospermum scoparium*, *Arthropodium cirratum*, *Carpodetus serratus*, and *Statice latifolia*; but there were many others. Our illustration (fig. 1) shows the general appearance of one of the glacial blocks, which enabled us to see flowers from New Zealand almost as fresh as on the day they were picked. They confirm our oft-expressed opinion that it would be well if our colonial friends turned their attention to their own flora instead of devoting their horticultural energies towards the reproduction of European fancies. They would thereby greatly extend the resources of horticulture, whilst from a scientific point of view, they would render valuable service.

THE ROCK GARDEN, BEAR PARK, WENSLEYDALE.

THE number of visitors to the upper Yorkshire dales has enormously increased since the railway penetrated thence. It was in 1846 that the Great Northern began the railway from Northallerton to Bedale, which in February, 1855, was opened for traffic. Another company commenced to make an extension of the line from Bedale to Leyburn in 1853, and opened it in 1856. After this, for nearly twenty years no further extension was made till 1870, when a line was begun at Leyburn which was to run to Askrigg; this line was opened seven years later, and the next year 4½ miles of line was made to the town of Hawes. The whole of the railway from Northallerton to Hawes now belongs to the North-Eastern Railway, who run five trains each way daily.

Passing the town of Bedale, with its picturesque church, then the station for Jervaulx Abbey, Leyburn, and the pretty little village of Wensley is reached, which gives the name to the Dale which is supposed to commence here. Here the wildness and true character of the country begins to show itself; on the north, high above the stream and railway, is a huge but picturesque rampart of rocks, called "Leyburn Shawl." Passing Bolton Castle on our right, and Bolton Hall to our left (below the railway), another station—Redmire—is passed, when we notice a wild piece of undulating ground, covered thickly in places with Thorn, Holly, Wild Roses, &c. We have now reached our destination, Aysgarth station, which has become famous from the fact of being close to the falls of that name.

The view even from this point is extensive and beautiful: up the valley we can see Wild Boar Fell

2323 feet above the sea-level, and Cotter End over 2000 feet, and the intervening ridges and valleys; while to our right—north—is a long high ridge, the watershed of the Wharfe and the Yore; to our left—south—are lower ranges of hills, penetrated by minor streams, and here are Bishopdale, Waldendale and Coverdale; then, looking south-east, Penhill stands boldly out—a fine broad massive fell nearly 2000 feet high. There is a village on either side of the dale—Carperby on the north slope, and Aysgarth on the south, immediately above the river.

Mr. J. G. Baker, in his *North Yorkshire*, writing of this particular spot, says:—"At Aysgarth, in a deeply excavated rocky channel, with a wooded bank rising steeply from it upon either side, the river begins to form a series of picturesque rapids,

flora of this district is doubtless the variation in the rock formation, there being several forms—limestone, slabstone, shale, and on the summits gritstone. In this charming spot, surrounded and embracing some of the finest of Yorkshire hill and dale scenery, is situated the Bear Park estate. It is divided into three portions, from the fact of the river and railway passing through, the latter running almost parallel with the former, but separated from it by a Pine wood and other trees.

Bear Park House is an old residence, which dates back about to the thirteenth or fourteenth centuries, and was formerly the residence of the Metcalfes, previous to the building of Nappa Hall. On the north side of the house, inserted in the wall, is a large stone, on which is chiselled the sacred

if some of the rocks which lie about in his fields and abounding in the vicinity were used, it would make the garden harmonise more with the surrounding country. It may be well here to remark that the lie of the garden is to the south; the slope of the lawn is very considerable, falling towards the railway, and as the line virtually passes through, it forms quite a pleasant surprise and attractive feature for the passengers as they pass. In addition to the herbaceous borders round the garden, on this slope a number of rocky beds have been formed and tastefully planted with permanent subjects, such as dwarf Rhododendrons, Ericas, Sedums, Saxifrages, Armerias, Lithospermum, &c. The large bed, which is the lower one, and nearest the railway, has many tons of rock in it, and is richly planted. We

FIG. 2.—ROCK SUMMER-HOUSE, BEAR PARK, WENSLEYDALE.

which are continued for about a mile; fed by the waters of the wide branching dales, which one after another have poured their contributions into it, the stream is now a fine river.

"Magnified by the long winding scars of the lower mountain limestone and interpolated slate beds, it flows down the pleasant Aysgarth glen, its dark peat-stained waters hemmed in upon both sides by shelving reaches of Moas-fringed grey limestone rocks, and above them there rises a steep bank covered thickly with aboriginal trees and bush-wood, Hazel, White Thorn, Brambles, and Roses of multiform specific types; and on the south are the broad Heathery slopes of Penhill, its peak 1200 feet above the stream.

"The main fall, which is over a limestone precipice about 20 feet in depth, is exceedingly fine in the impression of irresistible force which it gives when the river is swollen."

One fact which accounts for the rich and varied

monogram which, Sir George Gilbert Scott says, is probably the retabulum of a side altar, dedicated in honour of the Passion. The inscription is: "Sit nomen domini ihm benedictum" (Blessed be the name of the Lord Jesus), supposed to have been brought from Coverham Abbey at the dissolution in the time of Henry VIII.

For many years it was used simply as a farmhouse, before the present proprietor purchased the estate. Mr. Bradley at once commenced to renovate the building, but was careful to retain as much as possible of its ancient characteristics. After making some good roads, &c., Mr. Bradley gave his attention to the garden. When commencing this, Mr. Joseph Cheal, of Crawley, was consulted, who changed the aspect of the whole place, and laid the foundation for a beautiful though not large garden.

After the kitchen garden was formed, the lawns made, and some planting carried out, both in the garden and the park, it occurred to Mr. Bradley that

noticed here masses of the brilliant blue *Gentiana acaulis*, *Campanula pusilla*, *C. Hendersoni*, Backhouse's large white *Campanula*, which is one of the finest border plants we know, *Pinks*, *Pblox subulata* and its varieties, *Azalea mollis*, some of the best of the *Flag Iris*, such as *I. pallida*, *I. dalmatica*, and the pure white *I. Attraction*. In addition to these, a choice collection of *Narcissus* is cultivated. The *Scillas* and *Chionodoxas*, with their brilliant blue and white flowers, grow well. Another pretty feature in this rocky bed is the large rocks, covered with *Cotoneaster rupestris* and *C. congesta*. A few paces away from this bed is an isolated specimen of Young's Weeping Birch, 15 or more feet high, and branched to the ground, its graceful whipcord-like branchlets resting upon the grass.

Not far from this is a sunken wall of rough stone, almost concealed by shoots of *Cotoneaster microphylla*, *Ivies*, *Clematis*, and *Honeysuckle*. Alpine

plants, which like limestone, are abundantly planted, and some of the rarest plants from the Swiss Alps, Pyrenees, the Tyrol, are made use of. *Saxifraga longifolia* was in splendid style, almost better than it can be seen in its native haunts, the rosettes fully 10 inches in diameter.

The masses of Alpine *Rhododendrons*, *R. intermedium*, *R. hirsutum*, and *R. ferrugineum*, are excellent; *Primula marginata*, *P. viscosa*, and *P. Auricula marginata*, are apparently thoroughly at home. Some forms of *Saxifraga oppositifolia* and *S. Burseriaana* are as fine as when seen growing in their natural habitats. *Lithospermum graminifolium* makes fine large tufts; it is here, at 500 feet altitude, perfectly hardy. It is one of the rarest and most beautiful of the Borrageworts, forming large tufts, which consist of the woody root-stocks and grass-like foliage, only a few inches high, from which arise in summer arching clusters of pendulous flowers of a brilliant blue colour. *Pinus pumila* and *P. cembra*, two very suitable species, are used with good effect. *Juniperus sabinoides* and *J. tripartita* have also proved of value in this high situation. Mention may also be made of *Elymus glaucus*, which is planted on high ground in front of some dark *Juniperus* and other subjects; its deep glaucous-blue, ample grassy foliage, contrasts so well during the summer months, and for such positions it is an admirable plant to use.

A piece of land on the east side of the house was to be furnished with rockwork, and to this spot massive pieces of limestone were brought from the hills, and formed into rocky buttresses or mounds, which the garden path cuts in half, and on one side of which the lawn comes right up; while on the other the rocks are backed by a collection of trees and shrubs, and the crevices and slopes are well clothed with alpine and other plants.

At the west part of the garden, it was at one time contemplated to erect a summer-house; but as the rockwork in other parts had proved satisfactory, it was considered possible to use the same kind of rocks, and to form a cave or rock summer-house, which would serve at the same time for protection to the garden. Accordingly, a considerable quantity of very large pieces of rock were brought down, at the cost of much heavy labour.

Amongst these rocks a great quantity of suitable soil was placed, and in this way the rock-cave as seen in fig. 2, was constructed. Although the position is very bleak, still, most of the trees, shrubs, and other plants have thriven; and in the crevices of the rocks themselves, mossy and Lichen-covered alpine, dwarf species of *Ivy*, *Erica carnea* var. *rubra*, and other *Ericas* have become established.

At the time of my visit the garden was in excellent order, and bespoke good management and industry on the part of Mr. Shannon, the gardener. I cannot close these remarks without expressing my sense of the courtesy of Mr. Bartley in allowing me to look over this charming place. The photographs from which our engravings were taken are the work of Mr. T. A. Cotton, Ullswater, Green Lanes, Finsbury Park. The rockwork in the gardens is the work of Mr. R. Potter of Messrs. Backhouse's Nursery, York. R. P.

FOREIGN CORRESPONDENCE.

STREPTOSOLEN JAMESONI.

Of all flowering plants grown on the Riviera this is one of the most effective, and at the same time most useful, flowering as it does during the whole winter and spring months. As it may be seen growing here in a bush, sometimes about 4 or 5 feet high, and loaded with its beautiful orange-scarlet flowers, it is a sight that one would delight to see in our greenhouses in England, and it is a wonder that it is not met with more often. It delights to grow in the full sunshine, with abundance of water during the growing season. The gardener that first exhibits a specimen plant as large as described, and well flowered, at one of our English shows, will, without

doubt, cause a sensation. It is figured in the *Botanical Magazine*, tab. 4605, under the name of *Browallia Jamesoni*, *Riviera*.

THE WEEK'S WORK.

FRUITS UNDER GLASS.

By M. TEMPLE, Gardener, Carron House, Falkirk, N.B.

CUCUMBERS.—Those plants which are freely fruiting should be afforded liquid-manure, and a mulch of half-rotted manure. Remove deformed fruits, frequently stop the growths, which is preferable to cutting out large quantities of vines and foliage at long intervals of time; and when the soil is watered, wet every portion of it. Under-watering, especially if the water be less warm than the soil, conduces to crippled fruit, and a bitter taste. The present is a suitable time for planting Cucumber plants, on beds with a mild bottom-heat, for autumn supply; Rollison's Telegraph is still a leading favourite, and Monroe's Duke of Edinburgh is a short-fruited variety, and a great cropper.

TOMATOS for latest crops may now be propagated by cuttings, or seed may be sown. We had some fine crops of Trophy last winter from plants sown at this season. Cuttings put singly into small pots, and potted on as may be necessary, are very fruitful, and not likely to grow so rank as plants from seed; they fruit freely in pots plunged in mild bottom-heat, but growth should not be rendered weakly from absence of air and a too high temperature.

PEACHES AND NECTARINES.—The past few weeks of bright sunshine have brought on Peaches and Nectarines rapidly; they are high coloured (not where foliage is poor and overcropping been practised), and quality good. They should be gone over every morning while the fruit is ripening, and carefully pulled when they move freely from the trees, handling them as little as possible, and they should be kept in an airy cool dry place till they are wanted. If they are to be sent to a distance, the fruit should be packed before they are quite ripe. Much water will be required by borders which are well drained; mulching is of much service to the maintaining of healthy root-action. Keep growth thin, and allow sun to have full power on the fruit. Give liquid manure liberally to late crops, and syringe freely.

VINES.—Grapes which are ripe, and will have to remain on the Vines for some time longer, will lose colour rapidly in bright weather, and should be shaded, but to shade foliage in full health is objectionable, so that pieces of blue or dark-coloured paper placed between the bunches and the glass is the better way. It is well known that Grapes when bottled and kept quite dark are kept in much better condition than those which are exposed to much sunlight. We still have Lady Downes' Grapes of last year in good condition. At this season Black Hamburgh and Black Muscat suffer very soon after ripening. The surface of borders in theinery, where Grapes are hanging, may be sprinkled with water during the early part of the day, which will help fruit and foliage alike; but theinery must be free from damp during the night. If the weather should become rainy, a small amount of fire would be unobjectionable in houses with ripe fruit hanging. White Muscat Grapes require all the light possible when ripening, and many good growers tie back any leaves which exclude it, and place a piece of tissue-paper over the bunches to prevent scorching. Early ventilation is of much moment to all ripening fruit, and a close sultry atmosphere should be avoided, especially if Grapes are for winter and next spring supplies. Lady Downes' must have special attention with regard to affording air and moisture. No variety of Grape needs to have a higher temperature than 85° to 90° if there are means to ventilate freely, and it should always fall 10° or 15° during the night.

STRAWBERRIES.—Young plants for early forcing should have liberal treatment till the pots are well filled with roots. All runners should be pinched off as soon as they appear, and roots should not be allowed to grow into the substance on which the pots are stood—a firm surface of bricks or pavement prevents all trouble. Plenty of water is required by the young plants just pegged in the small pots. Young plants put out in rich deep soil last August are supplying capital runners, while older plants are doing the reverse. The soil should not be

allowed to crack on the surface of the pots, and no weeds should be allowed to exist. While in southern parts Strawberries do well when potted towards the end of July, three weeks earlier is not too soon for the far north for first crops. Early in March, Black Prince and John Ruskin are favourites. Viscountess Thury, President, and Sir Joseph Paxton for main crops are generally much valued. Many fill the fruiting pots with soil (chiefly strong loam), and place the runners in them at once. I gave up that practice some years ago, preferring to use 3-inch pots first.

THE FLOWER GARDEN.

By T. H. CRASP.

GENERAL HINTS.—In the flower garden the principal part of the planting will be finished, and now the endeavour must be to obtain free growth in the plants by keeping the surface stirred and the soil moist. Avoid dribblings of cold water, which only retard growth. It will be well to take advantage of the first heavy shower to make the final sowings of biennials, either by sowing the seed on prepared ground, where the plants are to remain, or on beds for future transplantation. The only drawback to the first is, that birds prey upon the seed with impunity, although by putting black thread crosswise over the patches they are greatly deterred. Sow seed of Brompton Stocks under hand-lights, keeping it shaded and uniformly moist till germination takes place. Another sowing of Sweet Peas and Mignonette may yet be made if a late bloom is required. Carnations, Picotees, and Pinks, will now strike readily from pipings, if placed under a hand-light or bell glass containing good sandy soil, placed in a shady position, and kept close till growth begins, but the surest way for the first two is by means of layers when the plants have nearly finished blooming. Stools of choice Pansies which have ceased blooming, and are looking shabby, may be cut down, placing a mulching of decayed manure around them, thus encouraging fresh growth, which will flower in the autumn; or the shoots may be taken off, made into cuttings, and inserted in sandy soil. Do not delay to cut back overgrown shrubs, or those which are encroaching upon each other or on the walks and turf; when pruned at this season, new growth is soon made. Privet hedges should be clipped, and Holly and Laurel hedges may be cut back with the knife, although in the case of the former the shears are more generally preferred. Box edgings should now be clipped hard, with a view of obtaining the neatest edge for the longest possible time. Owing to the showers, bedding plants have begun to make free growth; and zonal Pelargoniums, which were early planted are forming seed-pods very freely, and these should be removed or growth will be arrested, and the beds will not be filled up satisfactorily. The surface of the beds should be hoed, and left in a neat state without having recourse to the rake, spent flowers removed, grass edges clipped, lawns mowed, and the walks rolled after rain. Where edging plants of *Cerastium tomentosum*, *Antennaria*, &c., have finished blooming, they should be trimmed into shape with a pair of shears. The different varieties of *Armeria* or *Thrift* should receive the same kind of attention, cutting the flower-stems as close to the leaves of the plants as possible. Attention should also be given to keeping low, by pegging, the shoots of *Verbenas*, *Petunias*, *Ivy-leaved Pelargoniums*, and plants of similar growth, thereby affording the beds a neat appearance.

DAHLIAS.—These plants, now growing rapidly, should have all the weak and flowerless side-shoots removed entirely, and the fastenings added to as may be required. The various plants in herbaceous borders should be kept free of decaying foliage and flower-stems, and the sub-tropical plants made secure against wind and rain by staking and tying. This is the time to sow the seeds of Brompton and Queen Stocks for next season's blooming. These plants, when well grown, are beautiful border plants, which none exceed in fragrance.

THE HARDY FRUIT GARDEN.

By T. TURTON, Gardener, Milton Erleigh, Reading.

SWEET CHERRIES.—Trees from which the fruit is gathered are often infested with black aphid at this season, and should have the tips of the shoots dipped in diluted tobacco-water or other preferred insecticide, and the entire tree syringed with the same; and if no doubt is entertained as to the non-injurious quality of the insecticide, it need

not be syringed off, thus adding to the defence of the trees against future attacks. Whilst the soapsuds and tobacco-juice are safe insecticides, those which largely consist of petroleum should always be followed with a heavy washing of clean water, applied with the garden-engine or powerful syringe, or the hose, before the mixture dries on the trees.

BUDDING.—The budding of Cherries, Plums, Peaches, Pears, and Apples, should be commenced if the sap flows readily, the kinds being taken in the above order. Budding is a simple operation, the employment of which is sometimes more convenient than grafting, and may be commended in particular to the amateur, and it is advisable if suitable scions cannot be obtained. The budding is similar in its method to that adopted with Roses, and the budded shoots are left at full length till the winter-pruning, thereby avoiding the risk of the buds starting this season, and of a check to the growth of the stock.

AMERICAN BLIGHT (*Schizoneura lanigera*).—Never before have I known this pest to be so troublesome as this year, which has led me to conclude that heat and drought are favourable to its propagation. The pest, if allowed to infest young trees, causes serious, and often permanent injury to them. Therefore, no pains should be avoided in dressing them with Gishurst Compound-soap, or an insecticide consisting of soapy-water and petroleum, the latter ingredient not being applied stronger than one wineglass to the gallon of water. Whatever is used should be well rubbed into all crevices of the bark with a stumpy painter's brush, and where this cannot be got, the syringe must be made use of. The insect sometimes infests the roots, and these should be laid partly bare, and watered with soapsuds.

HINTS ON GENERAL WORK.—Finish the layering of Strawberry runners, remembering that the earlier they are planted out the heavier will be next season's crop. Finish the thinning of Apples, Pears, and Plums, and the pruning of Plums and Pears on walls, and continue to afford root waterings unless rain has been sufficiently heavy to thoroughly moisten the soil to a good depth. If Raspberries are afforded a heavy watering, the canes will continue in bearing for some time longer. Place a good mulch of litter, grass, &c., over the roots of Doyenné d'Été, and other early varieties of the Pear, which are best when ripened on the trees, so that those fruits which may fall will not get bruised. The same applies to very early Apples, of which Copeman's is the earliest I know of.

THE KITCHEN GARDEN.

By H. C. PRINSEP, Gardener, Basted Park, Uckfield.

SUCCESSIONAL CROPS.—The unusual drought greatly checked the growth of most vegetables, and even now, in the south, if rain in quantity does not soon fall, the Potatoes and other root-crops will be light. It is seldom that Cabbage, Cauliflowers, &c., have suffered so much as during the present season, and it was difficult to keep plants alive. The gardener should not fail to plant good breadths of Kale, Broccoli, and Savoys, especially the first-named. Particular attention should be paid during the next few weeks to getting these plants well established by heavy waterings, and keeping them shaded till fully established.

CARROTS.—The crops of these roots are poor in most gardens, and the growth of those sown early is almost at a standstill. Another sowing should be forthwith made, so that there may be no break in the supply, the intermediate varieties making useful-sized roots by the autumn, if the weather be at all favourable. The roots of these varieties may be allowed to remain in the ground all winter, if a slight protection be afforded them in severe weather.

BROAD BEANS.—Attention will now be needed to keep the plants free from the species of aphid which harbours at the ends of the stems, preventing free growth. For this purpose, boil 1 lb. of Quassia chips for half an hour in 2 gallons of water, adding 2 oz. of soft-soap to each gallon whilst it is boiling, and before the mixture is quite cold dip the ends in it; a second application may be needed two or three days later. Mulching and watering must also be attended to, or growth will be slow.

PEAS.—The late sowings will now be ready for staking. After staking, mulch with cow-shed manure 4 inches thick, and water heavily. If aphid infests

the Pea plants treat as for Beans. The secret in growing good Peas in hot weather is to sow thinly, heavily water the plants, and destroy aphides.

RUNNER BEANS.—The last sowing should now be made, and when staking runners, so place the stakes that light may readily reach the plants. When poles are used, they should be at least a yard apart at the top. Attend to mulching the plants well, and supplying them with liquid or artificial manure. When in bearing and in hot weather, syringe them late in the afternoon, which will assist the setting of the blossoms and swell the pods.

THE ORCHID HOUSES.

By W. HOLMES, Gardener, Pickering Lodge, Timperley.

CATTELEYA GASKELLIANA AND C. G. ALBA are just about to open their first flowers, and will therefore succeed C. Mossie and C. Mendeli at a useful time. Give them a good supply of water until the flowering period is over, when they should be gradually dried off. The old *Cattleya labiata pallida* is a very near relative to *C. Gaskelliana*, but is a little later to flower. It will require the same treatment as *C. Gaskelliana* as regards water, &c. *C. gigas* and its freer flowering variety *Sanderiana*, along with *C. Warneri*, are now making a grand display; when these finish flowering they should be carefully watered until the pseudobulbs become properly matured. Any requiring potting or rebasketing should be seen to at once, so that they get well rooted before they become inactive; any plants not needing potting will be better if they are removed after flowering to a cool and airy part of the house. If left where they have made their growth they often start a second growth, and I find a cool treatment answers best in this case. We give plenty of air about the plants, and water them once a week for a time until the pseudobulbs are properly ripened, when the water is withheld until such time as we think they require it; any Orchid-growers must in this case use their own judgment. Push forward the potting of any *Cattleya Mossie* or *Mendeli* that have not been done, as these are now making roots, and they may get injured during this operation, if delayed. It is a good practice to have the plants sponged in soft-soapy water, to clean the dust off the leaves, also to rid them of white scales which harbour on the pseudobulbs and the underside of the leaves. When potting a *Cattleya*, always make the plant firm, so that there be no rocking about if moved. One stake may hold the plant firmly if in a small pot, but two or three will be required for a plant in a 10-inch pot. Always press the compost firmly with the hand round the plant. Less water will be needed after potting, until such time as the roots take hold of the new compost. Keep the plants fairly shaded, and a moist atmosphere around them until more water can be given. *Lælia purpurata* will now need looking over, and the potting attended to; the same compost suits these as for *Cattleya Mossie*, always using clean pots and crocks. *Lælia tenebrosa* should be seen to as well. Keep *Lælia Boothiana* or *Cattleya lobata* on the dry side, as this is apt to make a second growth, which has not time to get properly ripened. *Cattleya Schilleriana* may be top-dressed now, and watered sparingly. This is one of the *Cattleyas* which often makes a secondary growth, but will make up and flower later on; however, if they can be kept quiet after making one growth, they flower all the better for another season. *Cattleya Trianei*, *C. Schrodera*, and *C. Lawrenceana* in full growth must now be well attended to with regard to watering, shading, and giving air, so as to make up well-matured pseudobulbs. Besides watering the plants, it is a good practice to syringe well between the pots twice a day during the very dry and hot weather. *Dendrobium* in full growth must be given plenty of water, syringing, and a high temperature, closing the house up early in the afternoon so as to get a good, clean, and quick growth. Keep a sharp look-out for thrips and red-spider, as the weather we have had has been all in favour of these pests. Temperature for *Dendrobium*-house should read 70° to 75° by night, 80° to 85° by day, closing early in afternoon, to allow the temperature to run up to 90° or even 100°, which will do no harm.

PLANTS UNDER GLASS.

By BAILEY WADDS, Gardener, Birdsall Gardens, York.

SOUVENIR DE LA MALMAISON CARNATIONS, AND OTHERS.—The present is a suitable time to layer these plants, choosing those that have done

flowering, and not required for growing on to make larger plants. The best place for layering them is a Cucumber-pit or frame with slight bottom-heat remaining in it; or failing that, a bed in a cool-house will do very well in a season like the present. Not having either of these, a sheltered border in the open air will do; but layers root much quicker and make stronger plants on an old dung-bed. The old plants in pots, if dry, should be well watered and plunged to the rims in a bed of soil, or into the fermenting materials with a piece of slate beneath, and a mixture of sandy loam and leaf-soil in about equal parts should then be spread all over the top of the bed to the depth of 4 inches. The pots should not be placed too close together, but afford sufficient space for each layer to be taken up when rooted with a good ball of earth. The best plan is to start at one end of the bed or border, plunge one plant, say the best growths, and then proceed with another, and so on till all are done. Stout bracken or wooden pegs are the best; metal pegs sometimes cause canker. Care should be taken in cutting half-way through, just below a joint, to cut upwards to the next joint or node, and in bending the shoot, not to break it off. After having layered the required number, afford the bed a good watering, but do not keep it too wet afterwards, or the plants will turn yellow. Slight shade from bright sunshine, and a moist growing temperature, are necessary points to attend to; and greenfly must be killed by fumigation, or syringing with Quassia-water, or a solution of nicotine-soap. Plants in 6' or 8-inch pots that have passed out of flower, and which are intended to be kept for another season, should be re-potted into pots of a larger size—say, 10 and 12-inch pots, if care be taken with the watering at first, and to keep them clean. The pots should be well-drained, and the compost consist of turfy-loam, leaf-mould, and silver-sand, with the addition of some decayed dry cow-dung or fertilising moss, a good portion of which may be placed over the crocks. The leaf-mould used should be dry, and well-prepared from leaves several years old. The varieties, Madame Arthur Warocqué, scarlet, and the red variety, are more hardy and easier of cultivation than the larger-growing varieties. The crimson, the pink, and rose-coloured, and Lady Middleton, are very beautiful varieties just at present, the weather having been suitable for them. Most of the tree varieties may be layered out-of-doors, and the layering should be done as soon as the bloom has gone over. Useful varieties are Germania, Countess of Paris, Miss Joliffe, Purity, and Winter Cheer. Cuttings of Mrs. Sinkins, and the double varieties of the old white and other Pinks, should be put in, in quantity, the plants to be grown in 5 and 6-inch pots for forcing in the winter and spring. Five or six cuttings put into a large 60-pot, and placed in a moist place, will soon strike root. It should be borne in mind that all Carnations and Pinks when grown in pots, to be objects of beauty, should be afforded liberal applications of plant-food. I find that a change of plant stimulants to be the best in practice, and I never allow any greenfly to remain on the plants. Afford abundance of air night and day. For the destruction of wire-worms and eel-worms, dissolve ½ lb. of nitrate of soda in 4 gallons of soft-water; let the plants get a little dry, then stand the pots in it up to the stem of the plants for ten minutes—use a pail for the purpose.

CHRYSANTHEMUMS.—For the production of stout useful plants for decoration or for cutting from, cuttings 4 or 5 inches long should be taken from the leads of strong young plants, and struck singly in 5 or 6-inch pots in a cold frame. The pots should be clean, with good drainage, on which some turfy-loam should be placed, and the pots filled to within 1 inch of the rim with sifted soil, with half-an-inch of silver-sand put on the top. Place the cold frames on a bed of coal-ashes, shading the cuttings with a thin wash of lime. Having pots and labels ready, take them to the plants, one man writing the names on the labels, and another taking the cuttings and inserting them in the pots. There is no need to plunge the pots, but after having watered them close the frame, which must be shaded with mats, as well as limewash for a time during bright weather. The cuttings must not flag at any time, and should be watered well, and at times sprinkled with a flower-pot. Keep close till rooted, then ventilate gradually at first, and apply less shading until full exposure becomes safe. Plants struck at this time and in this way are very useful, and the plants from which the shoots were taken will soon start anew, when one or two breaks should be selected from each,

APPOINTMENTS FOR THE ENSUING WEEK.

MEETINGS.

WEDNESDAY,	JULY 5	{ Royal Botanic Society: Evening Fete, 8 to 12 P.M.
FRIDAY,	JULY 7	—Dundee Horticultural Society.
SATURDAY,	JULY 8	—Royal Botanic Society.

SHOWS.

SATURDAY,	JULY 1	{ Great Rose Show, National Rose Society, at the Crystal Palace.
TUESDAY,	JULY 4	{ Rose Shows at Canterbury, Gloucester, Bagshot, and Diss.
WEDNESDAY,	JULY 5	{ York Florists third Show at York (two days). Croydon Horticultural, Hereford Rose, Farnham Amateur Rose and Horticultural; Lee, Blackheath, and Lewisham Horticultural (two days); Ealing Horticultural.
THURSDAY,	JULY 6	{ Rose Shows at Bath, Farningham, Manchester, and Norwich. Chichester and West Sussex Horticultural.
FRIDAY,	JULY 7	—Ulverston Rose.

SALES.

FRIDAY,	JULY 7	{ Great Sale of imported Orchids at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—63°.

The Season, and its Lessees. THE effects on the crops consequent on the advent of rain after the prolonged heat and drought, will be watched with intense interest both by physiologists and gardeners. In the case of fruit trees, we may well anticipate that the crops will be light. On all sides we hear of the flowers drying up and falling almost ere they were set, except in some cases where the precaution was taken to mulch early and heavily, in which cases it is possible to tell exactly how far the influence of the mulch extended. The heat and drought that were so detrimental to the flower-buds seem to have been thoroughly appreciated by many insects, who have completed the devastation brought about by unfavourable climatic conditions.

The growth of trees in general has been severely checked, the shoots formed have been contracted, the leaves are stunted, and in many cases they have shrivelled and fallen before their time, particularly in the case of old trees of diminished vitality, and specially when growing on dry, gravelly or sandy soil. Flowers are small, and those produced on the young wood of the year, such as Roses, have been checked or rushed into bloom weeks before their proper time.

These are general, but perhaps not universal, results. Variation must have occurred according to local conditions, and those gardeners who have had the happiness to have had command of an adequate water supply, have managed to keep up their supplies of vegetables and Strawberries, and other fruits, in a manner which their less-fortunate brethren must have envied. As to strawberries, we have heard several complaints about the non-production of runners; but there is still time for this.

In addition to these sources of differences, there must have been similar variations consequent on the different constitutional endowments of particular varieties. Some varieties must have maintained themselves against adverse conditions much better than others. What are those varieties? This is a question which we trust our readers will give us an opportunity of answering.

As to the Roses, the forthcoming shows will, no doubt, afford some indications, but it is obvious that the results so obtained must be

balanced against the pains which the enthusiastic rosarian takes—pains which others, less enthusiastic, or with fewer opportunities, cannot rival. The eager controversy which last year agitated the minds of rosarians as to the number of trees grown by amateurs desirous of exhibiting, and the consequent balancing of means and opportunities might now be extended, and cognisance be taken of the supply of water available to rival competitors, the length of their hose, the capacity and the number of their water-pots! The requisite adjustments could then be made, and the decisions of the judges be based on more equitable conditions. But imagine the heated discussions that would take place—those which occurred in reference to the proposal to alter the date of the shows would be trifling in comparison. It would be interesting at this period, and in this very exceptional season, to know the present views of the gentlemen who were so anxious to alter dates to suit the presumed general convenience. If we could but know, say, only six months in advance what sort of weather we were likely to encounter, it is evident we could make our Rose and other shows movable feasts; but as things are, it seems best to continue to select some medium date when the greatest amount of perfection may, on the average of years, be anticipated.

It is desirable not only to gauge the effects of the drought and heat as we see them now, or in the immediate future, but also to look ahead and consider what are likely to be the consequences of the warm moist period upon which we seem to be entering. No doubt in many cases trees and plants which have been undergoing a forced period of rest will start afresh, as if a second spring had come, and we shall have an abundant development of new shoots, and a crop of autumnal blossoms. The autumnal Roses stand a good chance of being more numerous and of better quality than their summer sisters. All this will be interesting to the physiologists, but, as a rule, it will not be of much value to the gardener, for it will simply discount, on disadvantageous terms, the produce of the next spring. The farmer, however, who has been so severely tried, may now reasonably hope for a lattermath, and there is time for the development of a good root-crop.

The relation of the abnormal season to practice is also a most important thing to note. Is it necessary this season to indulge in much pinching and summer pruning beyond necessary thinning? Has not Nature herself afforded a sufficient check to development already? This is a point upon which experienced practitioners might profitably enlighten their juniors.

Another consequence of the present weather to which we may look forward is, the advent of the Potato-rot. A moist warm atmosphere favours the growth and development of the fungi which prey on the Potato plant, set up fermentation in its tissues, and engender rot. As we have so often pointed out, we are not so powerless against this pest as once we were. The Jensen system of high-moulding, or the judicious use of carefully-prepared Bordeaux Mixture, may certainly be relied on to diminish and palliate the evil to a very large extent. For cottagers and small growers the high-moulding system is probably the most desirable method, as it does not involve any dabbling with chemicals—a dangerous matter to trust to unscientific labourers. All that has to be done is to mould-up the haulm so that it shall not be, as now, in a furrow at the top of a ridge, but that the ridge shall be sharp at the top, and the

haulm project, not from the top, but from one side of the ridge, a little below the top. The ridge will require banking-up once a fortnight or so, till lifting time, and it demands no more skill than is involved in handling a spade. Even when the disease has been very far advanced, and all prospect of a crop seemed ruined, we have seen excellent results follow.

For growers on a large scale, who can easily procure the necessary materials and apparatus, and who can rely on the services of some competent supervisor, no doubt the spraying the haulm and both sides of the leaves with Bordeaux Mixture affords the best results. It may be well to repeat the formula which has been found most generally useful, and to counsel those who make use of it to do so in the first instance tentatively, and to begin with a dilute solution; but even if the haulm is injured by the mixture, the tubers will not be affected. In the preparation of the mixture, so far as we have seen, the great point is to secure the due action of the lime. If that is of inferior quality, or deficient in quantity, the results are correspondingly unsatisfactory. Better too much than too little lime. Technical educators could not do better service just now than in instructing their hearers how to mould their Potatoes, or how to prepare and how to use the Bordeaux Mixture.

BORDEAUX MIXTURE.—The simplest formula is the following:—Sulphate of copper, freshly-slaked lime, of each 5 lb.; water, 50 gallons. Dissolve the sulphate of copper (blue vitriol) in water in a wooden tub. Mix the lime to the consistence of cream in another vessel. Add the lime-water gradually to the copper solution, keeping it well stirred. Lime should be added till the solution ceases to have a blue colour when looked at through a depth of 2 to 3 inches. The object is to neutralise the acid of the copper-sulphate, and to obtain a neutral oxide which does not burn the leaves. The reader is referred to the communication to the Scientific Committee of the Royal Horticultural Society in July last (see *Gardeners' Chronicle*, August 6, 1892, p. 162). The properly-prepared Bordeaux Mixture may be used with a fine-rosed water-can, but it is much better to use a spray-pump. Care must be taken to put the copper-salt in the first instance into a wooden tub. When the mixture is properly made, and the acid neutralised by the lime, the solution may then be placed in metal cans or pumps without risk of injuring them.

THE ALBERT MEDAL OF THE SOCIETY OF ARTS for the present year has been awarded to Sir JOHN BENNET LAWES, and a like Medal to Dr. JOHN HENRY GILBERT, "for their joint services to scientific agriculture, and notably for the researches which, throughout a period of fifty years, have been carried on by them at the experimental farm, Rothamsted."

ROYAL WEDDING.—Messrs. WILLS & SEAGAR have received the royal command to supply the wedding bouquets on the occasion of the marriage of H.R.H. the Duke of YORK and H.S.H. the Princess MARY of Teck. The same firm has also received instructions to decorate the breakfast table at Buckingham Palace on the occasion of the wedding.

THE GHENT QUINQUENNIAL.—We have received a series of photographs of this Exhibition, a report of which was given in our previous volume. Since that time, the great Paris Show and the Temple Show of the Royal Horticultural Society have taken place. These, it is true, are annual exhibitions; but when we look at the extent, the variety, the interest, and specially the grouping, at the Ghent Show, as evidenced in the photos before us, we feel how very much better our Temple Show ought to be. A grand opportunity is afforded to the Royal Horticultural Society to make a really fine, well-arranged, and

instructive show at the Agricultural Hall; and though it is too early for a Special Fruit Show, we yet hope the Society will rise to the occasion, and not put the public off with the worn-out, stereotyped arrangements—or want of arrangement.

GREAT YORK GALA, JUNE 14, 15, AND 16—In our report of this exhibition, mention was made of an Alpine Garden designed and planted by Messrs. JAMES BACKHOUSE & SON, York, and on the recommendation of the judges, a Gold Medal was awarded by the committee to this very artistic floral work.

BONES IN THE CROCKING OF CHRYSANTHEMUM POTS.—A correspondent writes, warning growers of the Chrysanthemum who may have used broken bones, to turn out the plants, and ascertain

poisonous symptoms, in a few instances ending in death, have been caused by preparations of Male Fern. Hitherto the active constituents of the Male Fern root, on which its poisonous properties depend, have not yet been absolutely determined; but in the *Archiv. f. Exp. Path., &c.*, xxix., p. 7, a recent issue, these constituents are carefully described by E. POULSSON. He succeeded in isolating amongst them two substances, namely, filicin and filicic acid, which he considers to be the main causes of poisonous symptoms arising from taking preparations of Male Fern, and upon these the vermifuge properties of the root when given in medicine depend.

THE FROST IN CHINA—In connection with the severe cold experienced in Hong-Kong during

just before the autumn Rice harvest, severe cold and rain spoiled a large portion. One-third was lost, and Chinese speculators are said to have lost no time in buying up and shipping to Hong-Kong, Hainan, and Pakhoi, all the available stocks at Wanduiub, the great Rice centre.

SWEET PEAS AT CHISWICK.—Visitors to the Chiswick Gardens on the occasion of the show there on July 11, should not miss the collection of Sweet Peas which will be then in full perfection. They are grown in rather an out-of-the-way corner, and might be overlooked. The varieties are chiefly from Mr. ECKFORD, who has done so much towards popularising the flower and adding to the store of good kinds already in the trade. The large number of varieties will be thoroughly inspected by the com-

FIG. 3.—VIEW IN GARDEN, BEAR PARK, WENSLEYDALE. (SEE P. 8.)

the condition of the crocking and the roots, as some bones are on the market which turn putrid after being in the pots a short time. If the plants, he says, are put in clean pots supplied with sweet drainage materials, not much harm will be done. In one month from the time of putting them in the pots, the bones have become putrid. Those who have not yet finally potted their plants should test the condition of the bones they intend to use before putting them into the pots.

NEWCASTLE-ON-TYNE SUMMER SHOW.—From our advertisement columns it will be seen that the Newcastle Summer Show will be held in July, in conjunction with the great show of the Northumberland Agricultural Society, and with the attractions doubled we have no doubt it will be a success.

THE POISON OF MALE FERN.—During the past ten years several cases have occurred in which

last winter, and noticed recently in our columns, the following extract from a report by Mr. Acting-Consul FRASER to the Foreign Office, dated Kiungchow, March 22, 1893, will be of interest. The value of imports from outside China was lessened in 1892 by £3300 as compared with 1891, for 614 tons less rice was imported from abroad. This indicates bountiful harvests in 1892. This port and Hainan in general are not visited with the extremes of heat and cold which sometimes afflict their near neighbours, and are so injurious to agriculture. During the winter, when Hong-Kong, Swatow, Pakhoi, and other tropical places near were in ice and snow, the thermometer at Kiungchow only went down to 37° Fahr., which was for Hainan an unprecedented cold, and did a considerable amount of mischief. The Sweet Potato-fields presented a remarkable appearance with their graceful leaves blackened, as if fire had passed over them. The Sugar-cane also suffered. In Tonkin,

mittee, and the best singled out. From what we can see, there is need of considerable sifting, but many very beautiful varieties are in the collection, the flowers ranging from pure white to scarlet. Considering the dryness of the season, they are in good health, and constitute a "trial" of more than ordinary interest.

A GIANTIC PEA.—A correspondent, H. BONJANOVITZ, nurseryman, Ada, in Hungary, sends us some well-filled Pea-pods, which are of enormous size, i.e., they are 1½ inch broad at the middle, and 6 inches long, without parchment or thread, sweet and excellent in flavour. The bean grows to a height of 4½ feet, and it is very prolific, ripening in Hungary in June, therefore an early variety. It was found in the possession of a farmer-gardener in Servia, who had cultivated it for thirty years. We are promised a supply of new seed in this country next year.

HORTICULTURAL EXAMINATIONS.—The following are the questions put at the recent examination under the auspices of the Royal Horticultural Society, and the results of which were announced in our previous issue. The candidates were of all ages, from 15 to 40, and almost equally varied as to their attainments and their means of obtaining information:—

HIGHER GRADE.

*Eight Questions ONLY to be answered;
any eight the Candidate prefers.*

1. Explain the mode of formation of the soil.
2. What evils arise from stagnant moisture in the soil; and why is access of air necessary to the roots of plants?
3. In the selection of a site for the formation of a garden, what are the principal conditions to be observed? Describe those of most importance.
4. Describe the usual system of rotation of cropping in the kitchen garden, and what are the advantages derived therefrom?
5. Mention a few common weeds which usually grow—
 - (1) on clay soils;
 - (2) on sandy soils;
 - (3) on limestone soils.
6. Explain the ill effects which arise from too deep planting.
7. How may a succession of vegetables be obtained during every month in the year?
8. Explain the process of grafting, and state what objects are served by it.
9. By what circumstances is the work of the leaves impeded?
10. Why is a combination of various substances in manure generally preferable to the application of one substance alone?
11. Describe the method of preparing the ground for Strawberries; the preparation of the runners; also the best time and method of planting.
12. Give some illustrations where fungi, so far from being injurious, contribute to the welfare of the plant on which they grow.
13. What are the relative advantages of training fruit trees on the espalier system, and on walls?
14. What variations occur in the mode of growth of a cutting?

LOWER GRADE.

*Eight Questions ONLY to be answered;
any eight the Candidate prefers.*

1. On what circumstances does the productiveness of the soil depend?
2. Describe the method of preparing the ground for fruit trees, and the method of planting standard, pyramid, and bush trees on free, and on dwarfing stocks.
3. In laying out a garden, what are the first operations to be performed? Describe them in detail.
4. What do plants derive from the soil, and how do they take up nourishment from it?
5. What purposes are served by digging and hoeing?
6. What are the best manures for fruit trees? Describe the best way of applying them.
7. Describe the method of preparing the ground for such crops as Carrots, Beet, and Parsnips.
8. What are the circumstances favourable to the germination of seed?
9. What is understood by wireworms, and what are the best methods of dealing with them?
10. What are the conditions most favourable to the growth of Asparagus?
11. Why is blanching required in the case of Seakale, Celery, and some other crops?
12. Some plants produce their flowers from the old, others from the new wood. Mention the method and season of pruning adapted to both circumstances.
13. At what season of the year does the Celery-fly attack the plants? How may it be prevented?
14. Describe the system of culture by which Cucumbers can be grown out-of-doors in England at a profit.

COMBERMERE ABBEY.—Messrs. E. & H. LUMLEY, of St. James's Street, in conjunction with Messrs. OSNOUN & MERCER, have received instructions from Viscount COMBERMERE to sell the Combermere Abbey Estate, in Cheshire and Shropshire, and the sale will take place at the Mart on July 11. This estate comprises about 9000 acres, chiefly old pasture used for dairying purposes, and the rental is about £16,500. The abbey is said to have been built in 1133, and, although the exterior has been much altered, parts of the interior remain in their original condition, and some of the walls are 5 feet in thickness. After 400 years in the possession of the Benedictines, the estate was granted by HENRY VIII. to Sir GEORGE COTTON. The abbey stands beside a natural lake, about 2 miles long and 134 acres in extent, and is surrounded by 1000 acres of finely-timbered park. The abbey is situated about 3 miles from Wrenbury Station, which is on the estate, and 12 miles from Crewe.

EARLY HARVESTING OF PEAS, ETC.—We gather from the *Devon and Exeter Daily Gazette* of June 27 that, during the week ending June 24, at

Axminster, Messrs. VEITCH harvested 3 acres of their new garden Pea Exonian, and sowed a few rows of them again, thus making two crops of Peas in one season. Some days ago, Mr. VEITCH picked some Royal Apricots from an open wall, which had received no protection of any kind.

BULBOUS IRISES.—Professor MICHAEL FOSTER has republished, in an extended form, the lecture on this subject which he delivered before the Royal Horticultural Society. It is illustrated with numerous woodcuts, and a descriptive list of species, with an artificial key to facilitate their determination, is given. We need hardly say that this is a publication which all lovers of bulbous Irises will yearn to possess. It may be had by Fellows for 2s. 6d., by non-Fellows at 5s., from the offices of the Society, 117, Victoria Street, S.W.

PROLIFEROUS STRAWBERRIES.—From Lord RICHARD BROWNE and from Mr. DAWES we have received specimens of Strawberries in the condition

FIG. 4.—A PROLIFEROUS STRAWBERRY.

figured above. The explanation is simple. The edible portion of the Strawberry is the top of the flower-stalk, which dilates and becomes succulent. The true fruits or seed-vessels are what most people call the seeds. They do, indeed, contain the seed, but are in reality carpels. Carpels, as all botanists know, are modifications of leaves. It is, therefore, not surprising that the carpels, as in the case before us, develop into miniature leaves. Again, as the receptacle is a modification of the stem, it is not wonderful that it should, as in this case, produce buds and little branches, some of which even produce a flower at the extremity. The cases are interesting in relation to the famous Plymouth Strawberry alluded to on various occasions in our columns, and once thought to be extinct, but which is now widely diffused under the name *Fragaria muricata*. We have specimens growing received from Canon ELLACOMBE and Mr. F. G. WILSON.

CEDAR-WOOD IN CARACCAS.—The wood of the so-called Cedar, apparently *Cedrela odorata*,

seems to be an important article of export from Caraccas to La Guaira, where Consul BOULTON, in his report to the Foreign Office, tells us enormous quantities are stored as compared with the requirements of Caraccas, where all the Cedar is used. Prices, however, were well sustained during the year, because the cost of the Cedar is constantly increasing on account of the greater difficulties experienced in bringing it to market. The places where Cedar is cut are very distant already, and in consequence a considerable amount of money and labour has to be spent on the sometimes almost impassable roads, and often the Cedar has to remain a whole year where it is cut, if rain does not fall sufficiently to provide the small rivers with water, to take it down to the lake.

PROFITABLE GARDENING.—The question of cottage gardening, says *Reynolds' Weekly Newspaper*, is becoming one of increasing interest and importance with the growth in the number of allotments and small holdings. The extensive ignorance as to the proper mode of cultivating simple vegetables, and on such subjects as poultry and bee-keeping, is appalling. It is as disgraceful to this country as the ignorance with reference to simple cookery. What can be more disheartening than to find the villager of England buying eggs, hacon, Potatoes, Onions, honey, and such like things, imported from abroad, when, by a little industry, knowledge, and intelligence, they could be produced in his own back garden. It is as easy to grow a Strawberry as a Cabbage, when one knows the easily-understood separate treatment. Special attention ought to be paid to lessons in agriculture in the elementary schools in the rural districts, and the technical schemes of the various county councils ought always to embrace lessons in planting, sowing, cottage-gardening, and cookery—not elaborate scientific schemes, but plain, simple practical directions such as anyone could easily understand.

EULOPHIELLA ELISABETHÆ.—Commerce has its romance as well as Science. If any doubt be entertained upon the point, let the reader cast his eye upon the enclosed paragraph from a circular announcing the sale of a consignment of this very beautiful and remarkable Orchid, at the instance of Messrs. F. SANDER & Co., on July 7, at Messrs. PROTHEOR & MORRIS' Rooms. Astonishing as the statement is, there is no reason to doubt its veraciousness:—

"Respecting *Eulophiella Elisabethæ*, M. HAMELIN, in a recent letter to us, says:—'Excepting young and very small plants, no more *Eulophiella* are to be found, and the plants left will be guarded by my brother-in-law until they may be wanted by me. At least several years must elapse before these small plants are large enough to gather. Anatomists of this superb Orchid may be sure that no plants can or will be imported. I can guarantee that no man can collect them. My brother-in-law's will is absolute in the country of the *Eulophiella*, and from three years' exploration I do not believe this plant exists anywhere else in this terrible country. The difficulties of travel and the expenses are enormous. I have had great dangers to encounter, although I had at my command hundreds of men. If an amateur pays 100s. for a plant of *Eulophiella*, he owns a great prize for a trifle of cost—if consideration is taken of the great mortality among my plants, and the loss of many of my packages in a terrific storm at sea, and could one only know the sacrifice in human life that this plant alone has cost. We were constantly harassed by night, especially by the *Protoproterox madagascariensis*! (the Madagascar lion), which lives in trees, and preys on all living things. It is ferocious in the extreme, and one of its favourite haunts was among the tufts of the *Eulophiella*. It is to this animal I owe my relation to Moyambassa. This chief sent his brother-in-law with me as a guide and protector, but in an encounter with a lioness, this brave young chief had the flesh torn from his shoulders and back, and died. I was offered the alternative of marrying his widow, or being greased and burnt; but I chose to marry the widow, and ate salt with the man whose slightest wishes are immediately executed!"

PUBLIC GARDEN AT HACKNEY.—The Metropolitan Public Gardens Association have been the means of securing for the people of Hackney the opening of the garden in St. Thomas' Square, Hackney. The garden is about 1½ acre in extent, and belongs to the trustees of St. Thomas' Hospital. As they have, at the present time, five wards un-

occupied for want of funds, it will be seen they had no money to expend on beautifying the garden in St. Thomas' Square. Nevertheless, they willingly handed it over to the Hackney District Board of Works for the purpose specified. On Thursday afternoon, June 15, the formal opening took place by the Countess BROWNLOW, who was accompanied by the Earl.

A BOTANICAL GARDEN.—Messrs. L. RICKETTS and J. CAMERON have, states the *Madras Weekly Mail*, visited the Nundydroog Hills, with the object of establishing a botanical garden, as a branch of the Lal Bagh. Nundydroog is 4,856 feet above the level of the sea, or about 1,826 feet higher than Bangalore, the thermometer ranging during the hottest part of the year, 65° in the early mornings, while in Bangalore it ranges from 76° to 90°. During the hottest part of the day, the thermometer in Nundy is reported to have ranged no higher than 77°. The climate, consequently, is far superior to the Shevaroyas, and very nearly equal to that of Coonoor.

GRAMMATOPHYLLUM SANDERIANUM.—One of the sights of the Victoria-house at Kew at the present time is the monster plant of this Orchid, presented to the Royal Gardens, Kew, by Messrs. F. SANDER & Co., by whom it was imported. The gigantic pseudobulb or stems, which are 7 to 8 feet in height, and 3 inches in diameter, have no slight resemblance to so many snakes. From the base of the stems rise above the surface of the soil, or of the *débris* in which the plant is growing, a forest of slender roots, which give off short branches at right angles, and each of which ends in a sharp apine. It is possible that these upward growing roots are associated with the habit of feeding on decaying vegetable matter, and that the plant is thus a "saprophyte." On p. viii., vol. xiii., we give a reduced figure of the plant, and fig. 5 is a representation of some of the roots of natural size.

PUBLICATIONS RECEIVED.—*List of Works on Gardening and Horticulture, Forestry, Landscape Gardening, Orchids, &c.* (JOHN WHELDON & Co., 58, Great Queen Street, London, W.C.)—*Art Out of Doors*, by Mrs. SCHUYLER VAN RENSSAELER. (T. FISHER UNWIN.)

PLANT PORTRAITS.

DRACENA THALIOIDES, fol. var., *Illustration Horticole*, t. 175.—This is the *Dracena Sanderiana* of English gardens. What its true name and position may be is not at present known with certainty.

EUCALYPTUS GOMPHOCEPHALA, *Revue Horticole*, June 16.

GENISTA ANDREANA, *Revue de l'Horticulture Belge*.

NELUMBIUM SPECIOSUM, *Garden*, June 3.

SAINTPAULIA IONANTHA, *Garten Flora*, t. 1391; *Gardeners' Chronicle*, June 10, 1893.

THUNDERBOLTA GRANDIFLORA, *Garden*, May 27.

AZOLLA PINNATA.

(FIG. 6.)

We have received from Mr. Greenwood Pim, and from Mr. Burbidge, a copious supply of fruiting specimens of this elegant little aquatic. We may, perhaps, best describe its general appearance as that of a diminutive and floating *Selaginella*, its small crowded overlapping leaves having much the appearance of those of that genus. Their surface is velvety, and as they become old they assume a pink, and ultimately a brown appearance, which is very charming. The capsules, which nestle in the axilla of the leaves, are of two kinds. The males are flask-shaped, more or less flattened, and pointed, with numerous globular-stalked sporanges in the interior, and which contain the male spores. The female capsules are smaller, ovoid conic. The life-history of the two sets of spores, and the resultant fertilisation, are

very interesting to the botanical student, and have been dealt with by Strasburger, and in the June number of the *Annals of Botany*, just to hand, by Prof. D. H. Campbell, of the Leland Stanford

it was placed two or three months ago in a shallow peaty pool, which is now almost dry, there being only a few inches of water. In this the plant is producing fruit on almost every fully-developed individual. *Greenwood Pim.*"

HOME CORRESPONDENCE.

GARDEN PINKS.—Mr. Douglas mentions in the *Gardeners' Chronicle*, vol. xiii., p. 711, that he has managed to strike Pink cuttings without the aid of glass. So have I, many times; indeed, it is doubtful whether the glass covering is of material use, provided the situation in which the Pink cuttings are inserted is a shady one, and the soil sandy and porous. In such a position I have not found it at all difficult to root cuttings of Pinks of many varieties. It is so very easy to obtain stocks of these by taking the precaution to make the cuttings at the right time. The best seems to be just when the flowers are dying off, as it may be in other cases too soon, and the cuttings too sappy or too late, and the wood too hard. However, from the end of June till the middle of July is an excellent time, although this year, Pinks like everything else, are earlier rather than later. Pink cuttings will need very little making, if sharply pinched off; that is frequently enough; but it is very little additional trouble just to trim off the base of each with a sharp knife, and dibble them into sandy soil so fast as made. If the position be beneath a north wall, other shading is not required; but if the position be sunny, then some artificial shading should be furnished during the heat of the day, until roots are being made. We have now such a large number of sweet and beautiful Pinks, that a good collection may easily be had in any garden, not the large bursting flowers of the Mrs. Makins' type, but smaller and very profusely-borne ones, which are by far the best. Ordinarily, gardens furnish at the most two or three varieties. There should always be found from a dozen to twenty varieties. Pink plants the first year from cuttings, sometimes disappoint in not producing much bloom. They are engaged in establishing themselves then, but the second year they will bloom grandly. It should be the aim of gardeners not to foster old ragged clumps, but to have every year several acres of two-year-old plants to bloom profusely. *A. D.*

EARLY FRUITS.—When at Nettlecombe Gardens on the 19th, Mr. Elworthy told me he had gathered Peaches from trees of Alexander on the open wall—a thing he had never before been able to do. The flavour of the fruit was excellent. At the village of Alcombe, near Minehead, on June 24, Apricots and Citron de Carme Pears have been gathered in a ripe condition. Everything thereabouts is very early, but the vegetation is suffering from the continued drought. Minehead is naturally an early place, and large quantities of Potatoes are grown there for shipping to Wales. *T. H. Slade.*

—It may interest you to hear that I picked a full-sized and quite ripe Alexander Peach yesterday (June 25) from a tree five or six years old on an open south wall, and there are several more very nearly ripe. *T. Woodham Mott, Much Hadham, Herts.*

ROOT-PRUNING.—What are the results of root-pruning in a season of drought like the present? During the last few years I have planted some 200 Apple trees, and carefully tended them, so far as my ability went, on the newest principle—the result this year—failure of crop. In February I was congratulating myself on a magnificent crop, the trees showing bud wherever they could, and the bloom was thick and strong. Owing to the hot, sunny, dry days that we had, a good deal of this failed to set, but if even one-quarter had set there would have been plenty of thinning to do. Much of the bloom dried up and shrivelled before setting; nevertheless a fine set was secured, and I looked forward to a grand crop. For some time these trees, which are now six or seven years old, had, when the growth was over luxuriant, been root-pruned, and the roots shortened back to about 2 feet from the stem, and the ground made up with good loam and brick-rubbish, so as to encourage good fibrous roots, thus checking over-growth and encouraging fruit-bearing; but the drought set in, and as I was not prepared to treat all these trees as pot-trees, and give copious supplies of water continually, the result has been dropping the fruit, and a plentiful crop of red-spider. Now, would not the result this year have been much better if I had left the roots to Nature, and allowed them to extend and gather

FIG. 5.—AERIAL ROOTS OF GRAMMATOPHYLLUM SANDERIANUM. (Real size.)

For figure of the plant we refer our readers to p. viii of the Index to Vol. XIII, published with this issue.

University, California. The female capsules in the specimens sent are barely ripe. We may have another opportunity of examining them later on. In the meantime, we append Mr. Pim's letter: "I enclose herewith specimens of *Azolla pinnata* (ly., caroliniana), which

FIG. 6.—AZOLLA PINNATA.

are fruiting abundantly, an occurrence which is, I believe, rare in Great Britain and Ireland, though not uncommon abroad. The plants have been in the open air for a couple of years, at Mr. Walpole's garden, at Mt. Usher, co. Wicklow, and increased so much as to become quite a nuisance. A quantity of

moisture from a larger extent of the surrounding soil? Are we getting too artificial in the culture of fruit for such a season as this? I should be very glad to hear the experience of others on this subject, but from the result of this year I think root-pruning may be carried too far, and that the result may be loss of crop, unless one is prepared to treat the trees as pot trees, and water as such. For, of course, if the roots are cut back to, say, 2 feet from the stem, the tree is practically in the same position as in a 4 foot pot or tub, as the roots have not had time to push out into the new soil; and if these trees had been in such pots, they would have required copious watering at least twice a week during such weather as we have had the last three months, which, of course, would not be possible in a large orchard. I think this is a matter in which some of our fruit-growing experts should give us their opinions. [We think so too. Ed.] *Philip Crowley, F.L.S., F.R.H.S., Waddon House, Croydon.*

VINEYARDS IN SOUTH WALES.—Reading an account in the *Gardeners' Chronicle* of June 24, p. 748, from the *Wine Trades Review*, about the earliness of the French Grape crop, I am reminded of the Castell Coch and Swanbridge vineyards belonging to the Marquis of Bute, which I saw lately. These vineyards are cultivated according to French methods, and give one the idea of a Hop garden. The Vines are very healthy, free from disease, and heavily cropped. Should we get autumn weather favourable to the ripening of the Grapes, the result will doubtless prove very satisfactory. The wine made here is excellent, as one may assume to be the case by the prices obtained for some of it at recent sales. The management of the vineyards by Mr. A. Pettigrew leaves nothing to be desired. *T. H. Crisp.*

BONES AS DRAINAGE FOR CHRYSANTHEMUMS IN POTS.—A few days since, a member of the National Chrysanthemum Society wrote to say that the plants of Chrysanthemums he was growing for exhibition appeared to be quite ruined, the broken bones he had employed as drainage to the pots at the time of the final potting, three weeks previously, having become rotten and putrid, alive with maggots, and emitting a most noisome stench. He had taken the precaution to procure the bones from a well-known firm, and when received and in a dry state, they appeared to be an excellent sample. His object in writing to me was to get the fact of his mishap made public, in the hope that it would deter others who had not finally potted their plants from making a similar experiment. The matter appeared to be one of so much importance that I sent the letter on to an expert, Mr. Norman Davis, of Camberwell, and asked him if he could suggest a remedy. In his reply, Mr. Davis said that such experience is unfortunately by no means uncommon, as he is continually hearing of plants of Chrysanthemums being spoilt by the injudicious use of compounds or material totally unfitted for the purpose for which it is recommended they should be employed. There is no doubt but that in this case the bones had been imperfectly prepared, or they would not have so soon become putrid. So far as the presence of maggots is concerned, they would cease to exist, but it is imperative that the bones be got rid of. There is no better remedy than to repot the plants, replacing the bones with a mixture of broken charcoal and old lime-rubbish, such as old plastering, as the presence of these in the soil will have a tendency to sweeten it. In addition, Mr. Davis advises watering the plants as soon as they are re-potted with luke-warm water, dissolving in each gallon employed half an ounce of common washing soda; this operation will tend to clear away any particles of sour fatty substance which may be adhering to the roots; and then there is every probability the plants will start into a healthy growth. Bones should never be used as crocks for drainage; as, even when they have been properly prepared, they are liable to ferment, and foster the development of maggots. When mixed with the potting-soil, they are likely to prove advantageous. It is well to remember that many of the compounds sold as artificial manures need to go through a process of fermentation before the gases they contain can be made useful to the plants, and especially is this the case with the various preparations of fish, erroneously termed guano. Mr. Davis regards the proper crocking of pots as a matter of great importance, and he points out there is a tendency in growers of Chrysanthemums in the present day to utilise the space hitherto occupied by crocks with

some material which will act as drainage and supply plant food at the same time; but without experience of their action, they should not be employed, lest they may seriously injure the plants. Mr. Davis considers charcoal as sometimes dangerous, inasmuch as it will store up in itself some substances which, when liberated, may seriously injure the roots. *R. Dean.*

THE SEASON AND FRUIT.—May I send you a few dates and notes on fruit and weather, now the most remarkable drought which I remember has come to an end, and the earliest season for fruit ripening, a month earlier than usual. A dish of William I. Peas, pods well filled, was gathered on April 16 in the open ground, sown January 19. A ripe Juneating Apple fell on June 10 from an old tree which bears almost every year. The wind has now shaken down most of the remainder. First ripe, 1892, July 15; ditto, 1891, July 27. The first ripe fruit on a Doyen d'Été Pear, an oblique cordon on Quince, on a south wall, fell June 19; there are still some left on the tree. On June 21 a fruit of the Alexandra Early Peach was ripe on south wall without any protection. Lucombe Seedling Apples were a good size on June 12, and made a very good tart. The only frost in April was 2° (April 15), there was no frost in May. Monday, June 19, thermometer stood at 88° in the shade, and

BARON SCHRODER.

Saturday 24, it had fallen to 66°. There has been no steady rain here between February 24 and June 25, but slight showers fell on March 1, 6, 16, and 17; April 1 and 22; May 2 slight showers; May 16 to 23 some nice showers—one night, a heavy shower fell, which refreshed the gardens and enabled us to prick-out some seedling Broccoli and Sprouts. June 23 to 25, showers; it rained in the evening of the 25th; since which some nice rain has fallen, and there is now a tinge of green in some parts of the field. Cows have for many weeks had as much tub-meat as they have in winter. The ground in the garden is still so dry as dust at 1 inch below the surface. *H. R., Plymouth.*

GARDENERS' ROYAL BENEVOLENT INSTITUTION.

On Thursday, June 22, there took place at the Whitehall rooms of the Hôtel Métropole, the fifty-fourth annual festival of the Gardeners' Royal Benevolent Institution, Baron Sir Henry Schroder in the chair. The guests present numbered some 120 gentlemen, and included Sir Trevor Lawrence, Bart., Lord Teynham, Rev. W. Wilks, Master of the Gardeners' Company, Mr. H. J. Veitch, Treasurer of the Institution, Mr. P. Crowley, Mr. John Lee, the oldest member of the Executive and auditor of the Institution, Mr. Schlusser, Mr. W. Bull, Mr. O.

Thomas, Mr. G. Paul, Mr. J. Cheal, Mr. H. Laing, Mr. G. Munro, Mr. Rivers, Mr. A. Turner, Mr. Moss, Mr. N. T. Sherwood, Mr. Adams, Mr. P. Crowley, Dr. Hogg, Mr. T. F. Peacock, and Mr. A. W. G. Weeks.

The dinner over, the loyal toasts were proposed in graceful terms by the Chairman, who alluded to the fondness of the Royal family for flowers, and to the approaching Royal marriage. The toast of the evening, "Continued Success to the Gardeners' Royal Benevolent Institution," followed. The chairman said that at first he had been inclined to eschew the honour of taking the chair that evening, as he felt he was no orator; however, he was greatly interested in, and always had the goodwill of the Institution at heart, and resolved to give his testimony on its behalf. He took a great deal of interest in everything connected with horticulture. Despite the number of hospitals in that vast metropolis and its innumerable charities, there was none that spoke so much to the heart as this one. He pitied the man who was not fond of flowers. They were man's companions alike in joy and sorrow, and the associations of flowers went with them through life to the end. He knew people who discarded diamonds, but not flowers. If this was their regard for flowers, what ought to be their feelings with regard to those who tended those flowers with loving hands night and day at the risk of their health—the gardeners! Ought they not to do everything that lay in their power for them in their day of distress, and alleviate their necessities? They ought to be thankful that such a society existed as the Gardeners' Royal Benevolent Institution, which gave them an opportunity of showing their gratitude.

At the present time there were 150 pensioners and 1300 subscribers. One noticeable feature of the Institution was the encouragement that it gave to those gardeners who in their prosperous days subscribed to its funds. A rule lately adopted gave a gardener who had been a subscriber for four years, fifty votes at an election, and subscribers for a longer period received proportionately a larger number of votes.

The Chairman coupled with the toast the name of Mr. H. Veitch, the treasurer. The toast was most heartily received. Mr. Veitch, in his reply, spoke with much feeling, and alluded to the progress of the Institution, which, if sometimes slow, never stopped, and the smallness of present subscriptions was compensated by lessened expenses, but he continued to look forward with hope. When he reminded those around him that Mr. John Lee, the father of the Institution seldom failed to preside over its meetings, they might rest assured that every economy would be practised in its management. The pension list required £2700 yearly; the fixed income, however, was only about £1000, so that the great need of a liberal response to the Chairman's appeal would be manifest.

In the unavoidable absence of Dr. M. T. Masters, the next toast, that of "The Royal Horticultural, Royal Botanic, and kindred societies of Great Britain," was submitted by Mr. Arnold Moss.

Sir Trevor Lawrence on behalf of the Royal Horticultural Society, said that it and the other societies deserved well of the community; but he confined himself to the Royal Horticultural Society, alluding to the success of the Temple Show and to the fortnightly meetings; of difficulties overcome, and the increase in the number of its Fellows—254 this year.

The Rev. W. Wilks, M.A., offered the toast of "The Stewards and Officers" in a few brief sentences; Mr. N. T. Sherwood responding in fitting terms. The Secretary, Mr. G. J. Ingram, announced the total of the evening's donations to amount to £1454. The donations included:—Baron Schroder, 50 guineas; Baroness Schroder, 50 guineas; Messrs. Rothschild, 100 guineas; Mr. N. Sherwood, £100; Mr. Munro, £91; Sir Trevor Lawrence, 10 guineas; Mr. H. Williams, £35; Messrs. J. Veitch & Sons, 20 guineas; the Vintners' Company, 10 guineas; Mr. Alma Tadema, 10 guineas; and Mr. N. L. Cohen, 10 guineas.

SOCIETIES.

ROYAL HORTICULTURAL
Scientific Committee.

JUNE 20.—Present: Dr. M. T. Masters, in the chair; Messrs. Morris and McLachlan, Dr. Müller, Professor Oliver, Dr. Bonavia, and Rev. G. Henslow, Hon. Sec.

Scale on "Retama."—Mr. Morris observed, with reference to this subject, brought before the last meeting, that the name of the Retama is *Cytisus nubigenus*. It is the only ligneous plant growing on a platform, at an elevation of 8000 feet, on the Peak of Teneriffe. The whole of the plants were covered with the scale. Dr. Perez had noticed no instance of this scale insect appearing until Australian trees had been introduced into Teneriffe. Mr. Morris added that it has now appeared at Kew on the English Broom.

Honeydew on Limes.—Mr. Morris remarked that this had been so abundant on the Limes at Kew that the cement pavement below them had become quite slippery from the drip from the trees. Mr. Henslow added that he remembered a similar occurrence from an Ash tree in a garden in Regent's Park Road about the year 1878.

Oranges in Devon.—Mr. Morris exhibited photographs of Orange trees growing and fruiting successfully in arched recesses at Coombe Royal, near Kingsbridge, Devon. They were protected in front during the winter.

Cochineal in Teneriffe.—Mr. McLachlan raised the question of the cultivation of this insect in Teneriffe, as the industry appears to have decayed in consequence of the introduction of aniline dyes. Mr. Morris observed that it was somewhat reviving, as there was a certain demand for colouring fruit, preserves, &c. Dr. Müller added that it would be always required as a source of carmine, as this colour cannot be replaced by any other known product.

Thereva nobilitata in Celery.—Dr. Müller exhibited grubs resembling wireworms, which were found in decayed Celery plants. They proved to be those of a brown fly. This usually lives in rotten wood, but whether the grubs destroyed the Celery, or were feeding on the decayed roots, &c., was not clear. It was suggested that possibly they were carnivorous, as other grubs had disappeared from the soil.

Calochortus and Lily, monstrous.—Dr. Bonavia exhibited flowers, each consisting of two flowers united on one floral receptacle. An examination of the fibro-vascular cords showed that these had arisen by chorisis from a normal stem. *A propos* of this, Mr. Henslow said that he had examined the cords in a germinating Cockscomb, and found that the multiplication of the bracts and flower-buds arose in a similar way. The zone of cords being circular in section below, the cords rapidly increased in number by bifurcation above, one branch entering each bract, and a small cluster each flower-bud. Hence, fasciation would be better described as the effect of cauline chorisis, and not as a fusion of a number of independent buds, as the term seems to imply.

Azolla pinnata fruiting.—Mr. Greenwood Pitt sent through Dr. Masters, specimens in fruit. He writes—"The plants had been growing in the open air for two years in Co. Wicklow, and had increased to a large extent. Two or three months ago a quantity was placed in a shallow peaty pool, which is now almost dry, having only a few inches of water. In this the plant is producing fruit on almost every fully-developed individual."

Linaria repens × vulgaris.—Mr. Henslow showed specimens of this hybrid which has occurred spontaneously near the station at Oxford, with the following remarks received:—"L. repens was not known prior to 1889, when ballast was brought from Didcot. It appeared in 1890 side by side with L. vulgaris. In 1892 a complete chain of hybrids was found from L. repens, with a little yellow on the lip, to L. vulgaris, with the faintest stripe on the flower."

RICHMOND HORTICULTURAL.

JUNE 28.—This is generally one of the most attractive exhibitions amongst those held in the suburban districts of the metropolis, and upon the occasion under notice a large and comprehensive schedule included upwards of a hundred classes. A very large number of these, however, were for prizes offered by ladies and gentlemen living in the neighbourhood, and who appear to take a very lively interest in the Society. Four fairly spacious tents were erected, but owing to a number of entered

exhibits failing to appear, at least two of these were not so well furnished as they might have been; still, the exhibition was a pleasing one.

The first open class was for a group of plants in or out of flower, arranged for effect, not to exceed 100 square feet. The 1st prize was given to Mr. H. E. Fordham, Twickenham, for a very pretty and bright group in a semi-circle. The groundwork of Ferns, Gloxinias, Streptocarpus, &c., was relieved with a few Lilliums, Crotons, Palms, Hydrangeas, &c., the background being composed of Palms, Lilies, Crassulas, &c. 2nd, J. Marriott, Esq., Queen's Road, Coventry (gr. Mr. W. Finch). In some respects a well-considered group, but the edging not sufficiently tasteful, and the pots rather more prominent than desirable. The 3rd prize was given to Mr. W. J. Brown, St. Mary's Nursery, Richmond, who had a group in many respects better than the 2nd prize exhibit, but the plants were rather too crowded in this case.

For a group in a class for prizes offered by Lady Whittaker Ellis, the 1st place was taken by F. Wigan, Esq., Clare La Vo, East Sheen (gr. Mr. C. Want).

J. Marriott, Esq., Queen's Road, Coventry, was successful in a class for six stove and greenhouse plants in flower, distinct, Pelargoniums and Fuchsias excluded. This was regarded as the principal class of the show, and the collection in question was of considerable merit, although the plant of Erica Thompsoni had but little bloom upon it; Erica Parmenteriana and Phacoma prolifera were very good, as also were the plants of Ixora Fraseri, Bougainvillea glabra, and Allamanda grandiflora. Mr. J. F. Mould, The Nursery, Pewsey, Wilts, who was 2nd, was much in front of the others.

For a special prize offered by Sir Whittaker Ellis, for six Palms, not less than three varieties, there were several competitors, and the plants staged were large and good. W. Cunard, Esq., Orleans House, Twickenham, gr. Mr. J. Symonds, was 1st, and for a prize offered by Miss Thuillier, Tudor House, Richmond, for a single specimen Palm, the same exhibitor was equally successful.

The Fuchsias were not noteworthy. In the open class for six distinct varieties, W. Cunard, Esq., was 1st.

Foliage plants were well shown in the open division; 1st, J. Marriott, Esq., for six, with good and large plants of Kentia australis, Livistona chinensis, Kentia Blomereana, Croton Queen Victoria, Asparagus plumosus nanus, and Cordyline indivisa. A. Pears, Esq., Spring Grove House, Isleworth, was 2nd, and showed well.

Mr. C. Turner, Royal Nurseries, Slough, was 1st in the classes for show and decorative Pelargoniums, and for fancy varieties. His plants were in good condition.

Orchids are never a great feature at Richmond, and in the class for six Exotics, there were but two exhibitors. The 1st prize going to H. Little, Esq., Barronshall, Twickenham (gr. Mr. A. Howard). He had a good plant of *Laelia purpurata*, and his *Cattleya Mendeli*, *Oncoglossum vexillarium*, *Dendrobium suavisimum*, and *Vanda teres* were all commendable.

The same exhibitor was 1st for six Pelargoniums, zonal or bedding varieties; and 2nd for six Ivy-leaf Pelargoniums, distinct. The 1st prize for six Coleus was taken by W. Furze, Esq., Roselands, Teddington (gr. Mr. E. Coombs).

For eight exotic Ferns, distinct, a 2nd prize was awarded to T. Cave, Esq., Queensbury House, Richmond (gr. Mr. Wilks), with but median-sized plants.

Competition limited to Exhibitors Resident in the District.—Gloxinias were not at all up to the usual standard. The best nine were only awarded a 2nd prize; and the best six for Messrs. Sutton & Sons' prizes, somewhat better, came from Mr. Smith, gr. to W. H. Plum, Esq., Isleworth.

Only one lot of six Caladiums were presented, coming from Mr. Want, gr. to F. Wigan, Esq., Sheen; and Mr. Coombs, gr. to W. Furze, Esq., Teddington, had the best six Coleus, good flat well-coloured plants.

Of moderate dimensions were the exotic Ferns in the local class. Mr. Want being 1st with *Lomaria gibba*, *Davallia Mooreana*, *Aiantum formosum*, &c.

The class for six Lilliums being poorly filled, only small plants of Harrisii being staged.

Roses (open).—The fine collections from the trade growers, in competition for the prizes in the open classes, happily redeemed the Rose show from failure, as local flowers were poorly shown. In the

class for forty-eight trebles, Mr. B. R. Cant gave a taste of the excellence of the Colchester flowers this season, being a good 1st. Amongst his best blooms, were A. K. Williams, Charles Lefebvre, Comtesse de Rainbaud, Reynolds Hole, Alfred Colomb, Dr. Andry, Marie Verdier, Merveille de Lyon, Madame de Watteville, Souvenir d'Elise Vardon, The Bride, Ernest Metz, &c. Messrs. Paul & Sons, Chessunt, were 2nd; and Mr. W. Rumsey, Waltham Cross, 3rd.

In the class for eighteen trebles, Mr. W. Mount, Canterbury, was 1st; and Mr. W. Tayler had the only lot of twelve trebles.

In the class for twelve blooms, one variety, H.P.'s, Mr. Perkins of Coventry had charming blooms of A. K. Williams; Mr. Cant coming 2nd with Reynolds Hole.

In the corresponding class for Teas, Mr. Mount was 1st with The Bride, Mr. Cant following with Souvenir de S. A. Prince.

In the amateurs' classes, Mr. R. E. West of Reigate was 1st with twenty-four single blooms, also with twelve blooms; Mr. Warwick, gr. to J. P. Kitchen, Esq., Hampton, being in each case 2nd.

Of honorary collections, Messrs. Jackman & Sons, Woking, had a fine lot of blooms, as also had Messrs. J. Laing & Sons. Messrs. Perkins showed their new maroon-coloured Cactus Dahlia, a true form of this favourite class.

Dinner-table decorations, though very much of the stereotype, order always present considerable attractions here.

In the class for three stands, Miss L. Hulson, Gannorsbury, was 1st, with ordinary ep-runes, very charmingly dressed with Orchids, &c. Miss C. Cole, Feltham, was 2nd, her stands being dressed with white and pink Carnations, Sweet Peas, grasses, &c. With two stands, Miss Cole was 1st, in this case using the yellow Sweet Sultan, Pinks, Sweet Peas, and grasses; she also was 1st for a single stand; also had the best basket, dressed with pink Carnations, purple Beech foliage, &c. Messrs. Perkins & Co., Coventry, had, as usual, the best and beautiful cascade bouquets; and Miss E. L. Clarke had a superb basket of Roses, crimson, cream, and yellow.

Hardy Flowers were shown in great abundance by Messrs. W. Cutbush & Sons, Highgate, and in the competition for twenty-four bunches, Mr. Pritchard was a good 1st, with a beautiful lot, including Eryngium giganteum and amethystinum, Iceland Poppies, Gaillardias, Phloxes, Polemoniums, &c.; Mr. Sage, Ham House Gardens, was 2nd, having specially good Centaurea macrocephala, Campanula persicifolia, Helenium pumilum, &c. Messrs. Cannell & Sons exhibited from Swanley a collection of fine flowers of their double and single Begonias.

Fruit.—The best collection of six dishes came from Mr. Osman, Ottershaw Park, Chertsey, who had good Black Hamburg and Buckland Sweetwater Grapes, Royal George Peaches, Brown Turkey Figs, Elruze Nectarines, and Hero of Lockinge Melon; Mr. Sage was 2nd. The best three bunches of black Grapes in the open class came from the same exhibitor; Mr. Ford, Clovelly, Hounslow, being 2nd with fair clusters; and in the class for whites, Mr. Ford was 1st with fair Foster's Seedling. Mr. Osman coming 2nd. In the local class for two bunches of blacks, Mr. Knowles, gr. to Miss Egerton, Rehampton, was 1st, and was also 1st in the class for whites. Mr. Sage took first place in the class for four dishes of fruit, having black Hamburg Grapes, Figs, Rivers' Early Nectarine, and Melon. Strawberries were few, the best two dishes, good Oxonian and Sir J. Paxton, coming from Mr. Parsons, gr. to T. Twining, Esq., Twickenham.

Mr. Simmonds, gr. to W. Cunard, Esq., Orleans House, had the best dishes of Peaches in good Belle-garde; and the best Nectarines with Lord Napier. Of Melons Mr. Wilks was 1st, with a very small Hero of Lockinge; the same variety being 2nd, though small, the large fruits having no flavour.

Vegetables were, for the season, very good. In the open class for twelve dishes, Mr. C. J. Waite, gr. to the Hon. Colonel Talbot, Esher, was 1st, having fine Asparagus, Magnum Bonum Peas, Ashtop Fluke Potatoes, Perfection Tomatoes, L. viathan Beans, All Heart Cabbage, &c. Mr. Wilkins, gr. to Lady Theodora Guest, Blandford, was 2nd, but in the class for prizes offered by Messrs. Sutton & Sons, Reading, for nine dishes, he was a good 1st, having superb samples of All Cucumbers, Magnum Bonum Cauliflowers, Duke of Albany Peas, &c. Mr. Waite was 2nd. The same order was seen in the competition for Messrs. James Carter & Co.'s prizes also for nine dishes. Whilst in another

local class Mr. G. H. Sage was 1st, having in his collection some specially good Early Milan Turnips. Tomatos were excellent, handsome but not large. The best came from Mr. Simmonds.

Very good collections for so late a period of the season came from Messrs. Hugh Low & Co., Clapton, who had Cattleys, Lælias, Cypripediums, &c.; and Mr. H. Little, Twickenham, who had a fine lot of Cattleys, Odontoglots, &c., including some large and excellent Palms. Messrs. Jno. Peed & Sons, Roupell Park Nurseries, Norwood Road, S.W., staged a very good group, but the centre was rather low. A few good Caladiums were included. Mr. Chas. Turner, the Royal Nurseries, Slough, had a group of Carnations, Germania and Souvenir de la Malmaison; and also a group of Pelargoniums, in fine condition.

Miscellaneous.—As usual at Richmond, the groups of plants in this section were numerous, and of exceptional attractiveness. Besides those mentioned above, a large group of ornamental foliage and flowering plants was staged by Mr. J. F. McLeod, gr. to J. P. Morgan, Esq., Dover House, Roehampton, S.W. The plants in this group deserve special mention for the extra-good culture represented. Large well-coloured Crotonas, Caladiums, Begonias, and an immense variety of plants of superior merit were tastefully arranged. Messrs. Jas. Veitch & Sons, Chelsea, had a large group of Liliun longiflorum.

Messrs. J. Laing & Sons, Forest Hill, had a group facing one of the entrances to the large plant-tent. The feature of the group was the collection of choice Begonias, single and double, it included. For the rest, it was remarkably gay and pleasing.

Another group of miscellaneous plants was staged by Messrs. Puttock & Shepherd, nurserymen, Kingston-on-Thames.

A large group of decorative foliage plants in the centre of one of the large tents, was staged by Mr. Wm. Ixeton, nurseryman, Putney.

GARDENING AND FORESTRY EXHIBITION.

JUNE 28.—The Second Rose Show of the season was held at Earl's Court on Wednesday, and the earliness of the season showed itself very plainly in the Tea and Noisette classes, which were not so strong in quality as those shown a fortnight ago. Besides the classes for Roses, and a few other miscellaneous classes, a few had been arranged for fruit, and these brought a good display. In the first class, which was one for forty-eight Roses, distinct, single trusses, the prize went to a North Country firm, Messrs. Harkness & Sons, Bedale, Yorkshire, whose exhibit was really very good. The blooms were large, fresh, and full, the colour in most cases being also good. Particularly noticeable were Louis Van Houtte, Dr. Andre, Heinrich Schultheiss, A. K. Williams, Edward Andry, Duchess of Bedford, Earl of Dufferin, and Marie Baumann.

For twenty-four distinct Roses, three trusses of each, Mr. Frank Cant and Messrs. Harkness were declared equal 1sts. Messrs. G. & W. H. Burch, of Peterborough, were 1st in the class for twelve, with specially large blooms of Her Majesty, and good specimens of Exposition de Brie, Etienne Levet, Ulrich Brunner, Fisher Holmes, &c. For twenty-four Teas or Noisettes, distinct, single trusses, Mr. B. R. Cant, of Colchester, took the 1st place. The blooms in this section were not very good, and appeared a little past their best. Mr. Geo. Mount, The Rose Nursery, Canterbury, was 1st in the class for eighteen, and amongst the most noteworthy were Madame Cusin, Maréchal Niel, and Catherine Mermet.

In the garden Roses, Messrs. Paul & Son, Cheshunt, took leading honours for eighteen very creditable bunches. W. A. Richardson, L'Idéal, Madame Pernet Ducher and Gustave attracted most attention. Twelve trusses of any dark Rose were best shown by Mr. B. R. Cant, who had extra good Altred Colomb. The blooms were very large and full. Messrs. Perkins & Sons, Coventry, had the best light Rose in same number in their Her Majesty, also very fine. In the Tea and Noisette class, H. V. Machin, Esq., Gateford Hill, Worksop, was the best with Souvenir de S. A. Prince, but none of the Teas can be described as exceptional.

Coming to the amateur classes, we found a very creditable lot from E. B. Lundell, Esq., Barton, Hitchin, who took 1st prize for twenty-four H.P.'s, distinct, single trusses, showing fine Marie Baumann, Alfred Colomb, Earl Dufferin, &c.

The Rev. J. H. Pemberton, Havering-atte-Bower, Essex, took the corresponding position in the class

for twelve H.P.'s, three trusses of each. His best were Her Majesty, Chas. Lefebvre, and A. K. Williams.

For twelve distinct H.P.'s, single trusses, the premier position was taken by the Rev. Hugh A. Berners, Harkstead Rectory, Ipswich. The same position, that for eighteen Teas and Noisettes distinct, was taken by Henry V. Machin, Esq. The blooms were rather small, but otherwise were fair.

The Rev. A. Berners showed the best twelve Teas, and showed much better blooms than those in the larger class. A large group of Roses was staged by Messrs. W. Paul & Son, Waltham Cross, and included a new Noisette Madame Pierre Cochet, in colour between W. A. Richardson and Madame Falcot.

MISCELLANEOUS AND FRUIT.

Mr. T. Bones, Heaston Gardens, Cheshunt, took 1st prize for twelve bunches of cut Gloxinias, three blooms in a bunch.

Mr. T. Ware, Hale Farm Nurseries, Tottenham, was the only exhibitor in the class for a group of Begonias, arranged for effect, to occupy a space 12 feet by 8 feet. This was a very showy group, and contained some well-grown examples of the double and single sections, but it appeared to us insufficiently relieved by the usual Ferns, &c., which generally accompany such groups.

Mr. Anthony Waterer, Knap Hill Nursery, near Woking, showed a new hardy Spiræa called Anthony Waterer. It has a flower much deeper in colour than S. palmata, and the inflorescence is less pyramidal than that variety. A group of Clove Carnations was staged by Mr. J. Walborn, Cedars Nursery, West Kensington.

The fruit present was of very good quality, most of it gaining in colour from the unusual amount of sunshine.

Mr. J. McIndoe, Hutton Hall Gardens, took the first position in the class for six dishes, and showed Black Hamburg, and Muscat of Alexandria Grapes, Brown Turkey Fig, Grosse Mignonne Peach, Stanwick Elruge Nectarine, and Pear Clapp's Favourite. For three dishes of Black Grapes, those from Mr. Thos. Osman, the Gardens, Ottershaw, were best, —Black Hamburg, of good colour, and fair in bunch and berry. Mr. McIndoe was 1st for three bunches of white, showing Muscat of Alexandria.

Mr. H. Poulton, gr. to C. T. Cayley, Esq., Ivy Mount, Lewisham, had the best three Melons, showing very pretty fruits of Hero of Lockinge; and also the best single fruit, with Gunton Orange.

Peaches were well shown, the 1st prize going to Mr. C. Stocking, gr. to Walpole Greenwell, Esq., Marden Park, Caterham Valley, who had large fruits of Bellegarde. Mr. W. H. Divers, gr. to J. T. Hopwood, Esq., Ketton Hall, Stamford, who was 2nd, had rather smaller but finer-coloured fruits, and of a better shape. Mr. W. Robins, gr. to Colonel Lee, Hartwell House, Aylesbury, had the best Nectarines, showing large well-coloured fruits of Spencer. Amongst several competitors for Figs, Mr. W. Allans, gr. to Lord Suffield, Gunton Park, Norwich, took the lead, with a dish of Negro Largo.

J. Gurney Fowler, Esq., Glebelands, South Woodford, Essex, was 1st for two dishes of Cherries, distinct. Mr. W. Allan was 1st in the class for three dishes of Strawberries, showing large fruits of Gunton Park; and also in the class for one dish, with the same variety.

Amongst the groups and collections sent, "but not for competition," was a collection of fruits from Messrs. T. Rivers & Son, Sawbridgeworth. This included Peaches Alexander, Amaden June, Waterloo, and a wonderfully large seedling, of which six fruits were shown, the largest weighing fifteen ounces. Cherries were present in twelve varieties. Mr. S. Mortimer, Rowledge Nursery, Farnham, had three dozen Melons, which were associated with a large number of branches of Stephanotis, which certainly conveyed no sense of congruity, but were interesting as showing very exceptional freeness in flowering.

Mr. T. Berridge, gr. to T. Unwin, Esq., Norwood Lodge, Southall, showed Tomato plants and shoots in several varieties; and a collection of twelve dishes of Tomatos was staged by Messrs. Fellowes & Ryder, Northumberland Nursery, Orpington, Kent, as well as fine dishes of an apparently good Tomato, Duke of York.

Mr. G. Featherby, The Vinerias, Gillingham, Kent, showed fine Black Hamburg Grapes, some Tomatos, and Carter's Model Cucumber. Messrs. P. Barr & Sons, King Street, Covent Garden, showed a collection of cut hardy flowers, including some varieties of Poppies. A collection of Delphiniums came from Mr. Jao. Forbes, Hawick, N.B.

THE WEATHER.

(By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees — a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.)

The districts indicated by number in the first column are the following:—

- 0, Scotland, N. Principal Wheat-producing Districts—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S. Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; * Channel Islands.

THE PAST WEEK.

The following summary record of the weather for the week ending June 24, is furnished from the Meteorological Office:—

"The weather continued fine and dry generally during the earlier part of the period, but some thunder and lightning, accompanied by slight local rain occurred at some south-eastern and southern stations. After the middle of the week, however, the conditions became unsettled and rainy at nearly all stations, the fall experienced in the east of Scotland being decidedly heavy.

"The temperature was considerably above the mean during the early days, but fell very suddenly on the 19th to 20th, and became somewhat low for the time of year. The average values for the whole week just equalled the normal in the north of Scotland, and slightly exceeded it in most other districts: in 'England, S.W. and the Channel Islands,' however, the excess amounted to 4°. The highest of the maxima occurred on the 18th in the northern and western districts, and on the 19th in the south and east; they were very high generally, ranging from 91° in 'England, S.,' and 90° in 'England, S.W. and Scotland, E.,' to 81° in 'Scotland, W.' and over Ireland, and to 79° in 'Scotland, N.' The lowest of the minima were recorded either on the 23rd or 24th, and ranged from 39° in 'Scotland, W.,' and 41° in 'England, S.W.,' to 45° in 'England, E. and N.E.,' and to 52° in the 'Channel Islands.'

"The rainfall greatly exceeded the mean in 'Scotland, E.,' and just equalled it in 'England, E. and N.W.:' in all other districts there was again a deficit, although the amount recorded over our south-eastern and central counties was more considerable than any experienced in those localities for many weeks past.

"The bright sunshine again exceeded the mean in Ireland and the greater part of England, but was below it in the north and east of Scotland and the northern and north-eastern parts of England. The percentage of the possible duration ranged from 77 in the 'Channel Islands,' and 70 in 'England, S.W.,' to 49 in 'Ireland, S.,' 44 in 'England, S.,' and to 20 in 'Scotland, N.,"

MARKETS.

COVENT GARDEN, June 29.

MARKET again well supplied. A brisk business doing, with prices easier. James Webber, Wholesale Apple Market.

PLANTS IN POTS.—AVERAGE WHOLESALE PRICES.

NOTICES TO CORRESPONDENTS.

BOOKS: E. P. The Australian Handbook for 1892. (London: Gordon & Gotch, St. Bride Street, Ludgate Circus, E.C.)

CARNATIONS: T. R. D. Badly affected with eelworms. Burn the plants. Turn out the soil, and start afresh.

CELOGYNES, DENDROBIUM: Isosoma. The effects of bad cultivation, in addition to sour materials and want of proper drainage, probably. The Eucharis bulbs seem to have got the bulb-mite, but from the miserable scraps sent we cannot be certain. Please send bulbs for our inspection.

FOXGLOVE WITH A CAMPANULATE TERMINAL FLOWER: J. C. It is a case of an irregularly-formed flower becoming regularly and evenly developed. In the language of botany, a case of Peloria. A similar flower was figured by us, September 26, 1885.

"KEW BULLETIN": Botanist. From Eyre & Spottis-wood, East Harding Street, Fleet Street, E.C.; a few pence each number. Monthly. Irregular.

LEAF WITH EGGS: G. P. Abinger. The stalked eggs of some fly—one of the Lace-wing flies.

NAMES OF PLANTS: J. Vearey. Celsia arcturus.—W. B. S. Judging from the leaf and diagram of flowering plant, we should take it to be what you suppose, Romneya Coulteri, see Gardeners' Chronicle, February 27, 1875.—A. J. A. B. Abelia

floribunda.—A. B. I, Sedum Sieboldi variegata (Crassulaceæ); 2, Veronica spicata (Scrophulariaceæ); 3, Potentilla, garden variety; 4, Alyssum calycium (Cruciferae); 5, Potentilla, garden variety; 6, Lyimachia vulgaris (Primulaceæ); 7, Hlabrothamnus fascicularis (Solanaceæ).—F. A. G. I, Sedum armentosum; 2, S. Sieboldi variegatum; 3, Semperivium tortuosum, variegated form.—T. D. Hyoscyamus niger, common Henbane, poisonous.—Amateur. 1, Dracæna congesta; 2, Cliveia miniata; 3, Begonia metallica; 4, Begonia, cannot tell from leaf only; 5, Dracæna terminalis; 6, Aspidistra lurida variegata.—M. T. I, Probably Pinus Pinaster; 2, Probably Pinus monticola; 3, Doodia caudata; 4, Veronica Traversii.—J. H. Dendrobium Devonianum and Afrides odoratum.—J. R. I, Oncidium Batemanianum; 2, Selaginella Mertensii; 3, S. stolonifera.—Gardener. 1, Dendrobium infundibulum; 2, Asplenium viviparum; 3, A. rhizophyllum; 4, Coccothoba platycladon; 5, Agrostemma coronaria; 6, Celsia cretica.—S. P. 1, Ceanothus azureus; 2, Aspidium coriaceum var. capense; 3, Dracæna "Bella"; 4, Anchusa italica; 5, Carex variegata.—W. H. S. 1, Clarkia pulchella var.; 2, C. p. var.; 3, Alonsoa incisa.—G. H. S. 1, Allied to Vaccinium (next week); 2, Mitraria coccinea; 3, Pentapterygium rugosum; 4, Magnolia fuscata; 5, Ipomœa Batatas; 6, Not recognised; 7, Eranthemum Deavosianum.—H. E. 1, Cattleya granulosa Dubuysonii, good; 2, Cattleya labiata Gaskelliana, ordinary; 3, Epidendrum nocturnum.—Fr. H., Darmstadt. Odontoglossum Galeottianum.—H. H., Darmstadt. Lycaste macrophylla.—G. Abbey. Odontoglossum Lindleyanum.—F. R. 1, Deutzia scabra, fl.-pl.; 2, Spiræa arifolia; 3, Lastrea frondosa.—C. W. D. Next week.—U. C. B. Geranium silvaticum, not pratense; Spiræa Thunbergii.—Young Gardener. 1, Begonia so badly injured by thrips, it cannot be identified; 2, Stachys lanata; 3, Polemonium coruleum variegatum.—J. S. W. Nepeta grandiflora.—R. R. 2, Arnebia echioides; 4, Ruscus racemosus; 5, Antennaria dioica.—J. S., Subscriber, J. W., H. M., H. B., T. W., next week.

NAMES OF FRUIT: W. H. B. Late Duke, probably; but the fruits were badly bruised, and we cannot be certain. In sending Cherries, Peaches, and Plums, it is always advisable to send leaves and young shoots.

ONIONS: T. R. D. The bulb is attacked by the maggots of the Onion-fly, which are doubtless the cause of the mischief.

PALM LEAVES: G. A. The fungus is Graphiola phœnicis, very common on Palms. Cut the affected leaves off and burn them. You might try the effect of spraying with weak Bordeaux Mixture, but use it carefully.

SIX ACRES OF LAND, AND A WALL FACING SOUTH, 6 FEET HIGH AND 500 YARDS LONG: Beginner. You may cover the wall with a glass-case or narrow house, and grow Peaches, Tomatos, early Tea Roses, French Beans, and Strawberries. There is no need to force the things, although some hot-water pipes would be useful. The subjects mentioned in your note, but including Tomatos, would bring in money in the generality of seasons.

TOMATO SPOT: Nemo. See last week's number. Burn all affected fruits, and spray the young unripe fruits with Bordeaux Mixture.

TOMATOS: A. K. X. The leaves are affected by Peronospora infestans; identical with the Potato blight. There is no remedy when the disease attacks the plants, and you should destroy by burning all plants affected, and to the healthy plants apply the Bordeaux Mixture (often described by us), once in three weeks, at first in a weak solution.

TREES FOR TOWN PLANTING: Inquirer. See Journal of the Royal Horticultural Society, vol. xiii., 1891. The best shelter-tree is the common Spycamore.

Prices and Samples of CRUSHED BONES in Various Sizes on Application.

CLAY & SON,
Manure Manufacturers, Bone Crushers, &c.,
TEMPLE MILL LANE, STRATFORD, LONDON, E.

PEARSONS' CHEMICAL MANURE.

This Manure has now been before the public for five years, and has, from its intrinsic merits, almost without advertising, forced its way into the front rank. Extensive trials during above period have convinced us, that for efficiency and cheapness, there is nothing in the market to touch it; we having employed it with the fullest success upon Vines and other Fruit Trees, Pelargoniums, Fuchsias, Chrysanthemums, and almost all kinds of Greenhouse Plants. This opinion is supported by all the gardeners who have tried it, all being enthusiastic in its praise.

Per ton, £16; per cwt., 20s.; 1/2 cwt., 12s.; 28 lb., 7s. 14 lb., 4s.; 7 lb., 2s. 6d. Sample tins, 1s. 3d.
Half cwt. and upwards sent Carriage Paid to any Station in England, Scotland, or Wales.

Circular, containing further details, instructions, and testimonials, free on application.

J. R. PEARSON & SONS,
CHILWELL, NOTTS.

SOW THE SEEDS of good health, prune and strengthen sickly and weak branches of the tree of life, with the aid of Holloway's world-renowned Pills and Ointment. The Pills improve the appetite, strengthen the digestion, and regulate the liver. Under treatment with the Ointment, bad legs become sound, scorbutic skins cast off their scales, and scrofulous sores cease to annoy. When rubbed upon the abdomen it checks all tendency to irritation in the bowels, and averts diarrhoea and other disorders of the intestines frequently prevailing through the summer and fruit seasons. Heat lumps, blotches, pimples, inflammations of the skin, muscular pains, and enlarged glands can be effectively overcome by using Holloway's remedies according to the instructions given to each purchaser.

Send for ILLUSTRATED LIST of

JOHN BLAKE'S PATENT SELF-ACTING HYDRAULIC RAMS,

For Raising Water for the Supply of Towns, Villages, Irrigation, Railway Stations, Mansions, Fountains, Farms, &c.

No Cost for Motive Power, which is obtained from the Stream of Water passing through the Ram.

NO OILING OR PACKING REQUIRED.

MADE IN SIZES TO RAISE FROM 300 TO 200,000 GALLONS PER DAY. WILL FORCE TO A HEIGHT OF 1500 FEET.

This ram works with no metal in motion.

This view represents a ram worked by impure river water, whilst pumping pure water from a well or spring, and forcing it to a small reservoir on the hill, at an elevation of 295 feet, and a distance of 1 mile, from which reservoir the water is gravitated for fire extinguishing and general requirements of mansion, stables, farm, and village.

TESTIMONIALS.

From CHARLES HART, Esq., A.M.I.C.E., 3, Avenue Road, Leamington,
March 13, 1893.

Brixworth Union Rural Sanitary Authority, East Haddon Water Supply.
DEAR SIR,—Since the opening of these works, in May, 1891, the two Double-acting "B" Rams supplied and fixed by you have done their work with a minimum of attention, uninterruptedly and satisfactorily. Pure spring water obtained from a gathering ground on the side of a hill is carried along iron pipes a distance of 548 yards, down to a cistern fixed in the ram-house. From this cistern it flows to the rams, which are driven by impure water—drawn from an adjacent brook, with an available fall of 12 feet—and thence by them forced along an ascending delivery pipe, a distance of 1520 yards, to an iron reservoir, at an elevation of 204 feet. From this reservoir mains are laid which supply the hall with its stabling, the rectory, six farm houses, two dairies, and twenty-four wall fountains for the villagers' use.

The average daily consumption exceeds 4000 gallons, which one ram easily delivers, thus exceeding your guaranteed quantity by more than 1000 gallons per ram per 24 hours. Generally the two rams are regulated to divide the work between them, but occasionally it devolves upon one only.

If more widely known, this means of supplying villages and small towns with a limited quantity of spring water, forced to a suitable elevation by means of your rams, driven by impure water, would most certainly be more generally adopted.—Yours faithfully,

CHARLES HART.

From the Right Honourable the EARL of HARROWBY, 41, Grosvenor Square,
London, February 21, 1893.

SIR,—I have pleasure in stating that the two Hydraulic Rams, which you supplied and fixed for me last autumn, at Sandon, have proved so far most successful, and that the work gives every promise of durability, while the economy, compared with the former much smaller and intermittent supply by steam pump, will be considerable.

With a fall of about 14 feet from a previously existing mill pool, the rams supply reservoirs 168 feet above the brook whence the water is forced, through pipes of $\frac{1}{2}$ mile in length.

They sent up, as long as I required it, about 41,000 gallons per day.

I now generally work the two rams alternately (for a fortnight or so each), but can at any time work the two together, if the full supply of 41,000 gallons should be needed.

The business of this somewhat complicated water-supply was conducted by you with singular promptness and punctuality; and no local difficulties arose in the execution of the work, owing to the excellent and efficient men whom you sent from your works at Accrington.

I am, Sir, your very obedient servant,
HARROWBY.

From Mr. J. A. RUTHERFORD, Agent to C. F. H. Bolckow, Esq., Estate Office,
Marton Hall, Middlesbrough, September 26, 1883.

DEAR SIR,—I am glad to say that the Rams you put down on the Hambleton Estate, for Mr. C. F. H. Bolckow, are working very well. You undertook with 16 gallons per minute, to send up 1500 gallons a day, and with enough water to work the Rams at full power, 2000 gallons a day. With a supply of $1\frac{1}{4}$ gallons per minute they are lifting 2200 gallons, and when working full power, 3100 gallons per day are sent up to a height of nearly 400 feet. They made a clear start, and have gone well since. The delivery pipe in the above case is 9000 feet in length.

From THOMAS ROBERTS, Esq., Estate Surveyor to His Grace the Duke of Sutherland, K.G., Surveyor's Office, Trentham Hall, Staffordshire, April 13 1886.

DEAR SIR,—I am pleased to say that the Hydraulic Ram you supplied and fixed at Tittensor (the residence of the Marquess of Stafford, M.P.), does its work very satisfactorily, with a fall of 9 feet 6 inches, raising 9000 gallons daily to a height of 150 feet. The Duke of Sutherland, K.G., inspected the working of the Ram, and expressed his entire satisfaction with it.

I am, yours faithfully,
THOMAS ROBERTS.

From Sir S. M. MARYON WILSON, Bart., London, November 17, 1891.

SIR,—I have much pleasure in stating that the two "A" Rams you supplied and fixed for me at Searles, on my Sussex estate, have proved a great success, especially when the small supply of driving water is considered, as with a supply of 7 gallons per minute only, they have daily thrown 3000 gallons to a height of 96 feet, and through a service of pipes over a mile in length; and testing them recently (with plenty of driving power) found they lifted 7000 galls per day. The economy effected by their use is considerable, as they have entirely superseded a steam pump.

S. M. MARYON WILSON.

From HENRY MORTON, Esq., Agent to the Most Honourable the Marquess of Ripon, K.G., Ripon, April 12, 1886.

DEAR SIR,—The Patent Ram, with $\frac{1}{2}$ mile of service pipe, a large galvanised tank, and other fittings, which you fixed for the Marquess of Ripon, for the conveyance of water from Hutton Moor Springs to Blows Hall and Copt Hewick Hall, are highly satisfactory to all concerned, both as an engineering success and the intrinsic merits of the materials supplied. About 6000 gallons of water per day are forced into the tank at Blows Hall, nearly a mile distant, and 127 feet above the Ram, the overflow falling into a 20,000 gallon underground tank, from which it gravitates through the 4-inch main 800 yards long, with a fall of 70 feet, to the service-cocks and fire-plugs at Copt Hewick Hall, where, in case of fire, two or three powerful jets of water can be thrown on to the roof of the Hall.

I consider your method of carrying out the work is everything that could be desired, and whilst the waste-power water from the Ram is less than you specified, the quantity elevated is just what you guaranteed. I am, dear Sir, yours very truly,
HENRY MORTON.

From T. H. SIDEBOTTOM, Esq., Etherow House, Hadfield, February 22, 1882.

Induced by the good report of my cousin, Mr. J. A. Sidebottom, as to the working of the Hydraulic Ram he had from you, I ordered the one you fixed here a year ago, which I am pleased to say has since worked well night and day. Yet the two Rams you fixed at Snow's Hill Maar, Gloucestershire, for my brothers and myself, are, I think, a still more remarkable example of your success. We had a Ram fixed by a well-known firm, which proved a miserable failure, and which your Rams displaced. They are forcing the water through three-quarters of a mile of delivery-pipe, a little in excess of the quantity you guaranteed, to an elevation of 340 feet, and without the slightest hitch to the time of the last report from our tenant.

From Mr. HENRY ROBINSON, Engineer to the Stockport District Waterworks Company, September 8, 1883.

DEAR SIR,—I can now report well of the two Hydraulic Rams we have fixed to your instructions for the supply of Disley village; 40,000 gallons per day was the quantity you promised they would force to a height of 68 feet, but, on testing them, I am convinced that 50,000 gallons is not the limit of their power, whilst the quantity of waste water used in driving them is not equal to half the capacity of the 6-inch pipe by which they are fed, and I am inclined to the belief that a more simple and efficient pump cannot be found.

JOHN BLAKE, PATENT RAM WORKS, ACCRINGTON, LANCASHIRE.

PEARSONS' CHEMICAL MANURE.

This Manure has now been before the public for five years, and has, from its intrinsic merits, almost without advertising, forced its way into the front rank. Extensive trials during above period have convinced us, that for efficiency and cheapness, there is nothing in the market to touch it; we having employed it with the fullest success upon Vines and other Fruit Trees, Pelargoniums, Fuchsias, Chrysanthemums, and almost all kinds of Greenhouse Plants. This opinion is supported by all the gardeners who have tried it, all being enthusiastic in its praise.

Per ton, £16; per cwt., 20s.; $\frac{1}{2}$ -cwt., 12s.; 28 lb., 7s. 14 lb., 4s.; 7 lb., 2s. 6d. Sample Tins, 1s. 3d.
Half-cwt. and upwards sent Carriage Paid to any Station in England, Scotland, or Wales.

Circular, containing further details, instructions, and testimonials, free on application.

J. R. PEARSON & SONS, CHILWELL, NOTTS.

To Nurserymen, Gardeners, &c.

WANTED, the above to try **SPENCER'S NEW FERTILISER**, there being no acids or chemicals used in the manufacturing of this Fertiliser. Prize growers of hardwood plants and root crops will find this the only thing wanting, it being the most genuine and powerful Fertiliser yet introduced. Can be used in powder or dissolved in water—a special advantage. Sample cwt. bag sent to any part, price on application. Analyst report with each parcel. Apply, I. SPENCER, 54, Spring Street, Hull, Yorkshire.

C. BEESON'S MANURE, composed of blood and bone. The best Fertiliser for all purposes. Sold in tins, 1s., 2s. 6d., and 5s. 6d.; also in air-tight bags, $\frac{1}{2}$ cwt., 6s.; 1 cwt., 10s. Full directions for use sent with each tin and bag. 1 cwt. and above sent carriage paid; cash with order. C. BEESON, Bone Mills, St. Neot's, Hunts.

BONES!! BONES!!! BONES!!! Any size from dust to 1 inch. Dissolved Bone Compound, for Top-dressing. All at 10s. per cwt.; less quantity, 14d. per lb. Carriage paid on 1 cwt. Terms, Cash with Order. Special quotations for large Buyers. E. S. WILES AND CO., Bone Crushers, St. Albans.

CONCENTRATED MANURE. GLOBE FERTILISER.

When using this Fertiliser for Flowers, Fruits, and Vegetables, results are marvellous. Plants grown in the open air are equal in Bloom and Beauty to those grown in hothouses. Sold by Seedsmen, 1d. and 2d. Packets; 1s. 6d., 2s. 6d., 5s., and 10s. in Bags, or from the Sole Manufacturers, Carriage Paid. Cash with Order. GLOBE MILL COMPANY, Stratford Market, London, E.

If set across three Columns the lowest charge will be 30s. Page, £8; Half Page, £4 10s.; Column, £3.

GARDENERS AND OTHERS WANTING SITUATIONS.

26 words, including name and address, 1s. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.

Births, Deaths, and Marriages, 5s. each insertion.

NOTICE TO ADVERTISERS.—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all.

Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

POSITION.—Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at No. 42, DRURY LANE, to A. G. MARTIN, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.

Advertisements for the current week MUST reach the Office not later than Thursday noon.

All Advertisements should be addressed to the PUBLISHER.

Publishing Office and Office for Advertisements, 41, WELLINGTON STREET, STRAND, W.C.

SUBSCRIPTIONS.

All Subscriptions payable in advance. The United Kingdom, 12 months, 15s.; 6 months, 7s. 6d.; 3 months, 3s. 9d. All Foreign Subscriptions, including Postage, 17s. 6d. for 12 months. Post-office Orders to be made payable at the Post-office, 42, Drury Lane, W.C., to A. G. MARTIN.

Subscribers who experience any difficulty in obtaining their copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint).

THE

Gardeners' Chronicle.

SATURDAY, JULY 8, 1893.

VICTORIA REGIA.

[SEE SUPPLEMENTARY ILLUSTRATION.]

THE great Water Lily of the Amazon still holds first place among the giants of the vegetable world which have been introduced into gardens. Other giants come and go; the Titanic *Amorphophallus* flowered once at Kew, died two years after, and is now no more except in its home, the swamps of Sumatra; big *Wellingtonias*, *Eucalyptus*, *Palms*, and other giant trees we know only from pictures, and the big *Rafflesia* from wax models; but the *Victoria* remains with us after nearly fifty years' acquaintance, and it can be grown to the same dimensions in a glasshouse in Europe as it attains in the tropics under the most favourable of natural conditions. In England it may be termed an expensive plant, as it requires a specially-constructed house and large tank, with a tropical temperature maintained at not less than 70°, and in some seasons at 80°; but it is worth the cost of its cultivation. The Botanic Garden of Kew without the *Victoria* would be shorn of as much interest as the Zoo would be without an elephant or a hippopotamus. The large leaves resting on the water, the beautiful fragrant flowers, and the exceptionally rapid development of the plant from a seed into full size within a period of about four months, these are characters which invest the *Victoria* with a special interest for lovers of plants. There are only two gardens in London in which the *Victoria* can be seen, viz., Kew, and the Botanic Garden at Regent's Park. Mr. Abraham Dixon, of Cherkley Court, Leatherhead, is perhaps the only amateur in this country who cultivates it. It used to be grown in the botanical gardens at Oxford, Sheffield and Birmingham. In my opinion, no public garden with any pretensions to an indoor collection of plants ought to be without a *Victoria* as a summer attraction. The largest tank I know of is in the Zoological Botanical Garden at Rotterdam, where three plants are grown, and where the leaves are so large and strong that three children from about ten to fourteen years of age have been supported by one leaf. It is also exceptionally well grown in the Royal Botanic Garden at Glasnevin.

The seeds of *Victoria* are kept in water always in a temperature of about 60°. They are sown in February in pans of soil placed in water kept at a temperature of 85° to 90°. As soon as the plants are large enough to handle, they are planted singly in pots in a richly-manured soil, and the water is kept at the same high temperature. In April the large tank is prepared. About six cart-loads of loam and cow-manure are placed in a pit in the middle of the tank, which is then filled with water, and heated to 80°. The plant is then placed in the soil at a depth of about one foot below the water. The house in which the tank is placed should be kept well ventilated, and top air left on all night in mild weather. By the end of June the plant should be nearly full size, and it will flower

soon after. Seeds are matured by plants cultivated at Kew. Some time ago we heard of a purple-flowered *Victoria* which had been discovered in South Brazil, and was called *V. argentinensis*, but on inquiry it turns out to be nothing more than a form of *V. regia* with a deeper tinge of crimson on the petals than usual. There is only one species of *Victoria*, and it is now cultivated or naturalised in most tropical countries. Its near ally *Euryale ferox*, a native of India, and remarkable for the hooked spines on the upper surface of its large leaves, and for its small purplish flowers, is grown at Kew in the same tank as the *Victoria*.

The structure of the leaf of *Victoria* is a remarkable instance of adaptation to circumstances. The under-side is clothed with strong spines, which protect the leaves from aquatic animals; and to protect

tection is afforded to it by spines on the upper-surface as well as below. *W. W.* [Our illustration is from a sketch taken at Kew by the late Mr. W. H. Fitch. On one of the leaves are shown, for the sake of contrast, the flowers of the large Australian blue Water Lily, *Nymphaea gigantea*, large indeed, but small in comparison with the *Victoria*. Ed.]

of it yet known are in the Tring Park collection. Two points seem to connect *C. W. Rothschildiana* with the *C. W. Sanderæ*, viz., the dark purple on the exterior of the side lobes of the labellum, and its sweet odour. There can be no doubt that we have in this a distinct form of *C. Warscewiczii*, superior to any previous importations of the species. *J. O'B.*

NEW OR NOTEWORTHY PLANTS.

CATTLEYA WARSCIEWICZII SANDERÆ.

At the meeting of the Orchid Committee of the Royal Horticultural Society, on June 6, Messrs. F. Sander & Co., of St. Albans, received an Award of Merit for the richly-coloured *Cattleya Warscewiczii*

LUSIA AMESIANA AND L. VOLUCRIS.

The two singularly interesting Orchids, of which we herewith give illustrations, were exhibited by Sir Trevor Lawrence, Bart., at the meeting of the Orchid Committee of the Royal Horticultural Society on June 20, when they each received a Botanical Certificate, and in our report we commented on the interesting structure of the flowers and their evident

FIG. 8.—LUSIA AMESIANA.

Sepals and petals whitish citron-yellow, streaked and speckled with purple-brown outside; labellum whitish-yellow ground, with purple-maroon spots.

FIG. 9.—LUSIA VOLUCRIS.

Sepals and petals cream-white; labellum intense purple-brown.

the upper surface, the margin is turned up all round, forming a rim several inches high, the outside of which presents a spine-clothed barrier to any swimming animals which might otherwise land on the leaf. The leaf is, therefore, a large round tray or shallow dish. Last year we tried the effect of pouring a quantity of water into one of these dishes, and although the leaf was intact, and the rim perfect, the water mysteriously escaped from the leaf as fast as it was poured into it. On closely examining it, we found the whole leaf was perforated with innumerable pinholes, no doubt intended to prevent the leaves from being practically submerged through filling with rain. The leaves when young are folded involutely, and are protected by the spines of the under-surface. The stalks of both leaves and flowers are thickly clothed with sharp spines. To prevent the leaves from crowding, the stalks continue to elongate long after the blade has matured. In *Euryale*, the leaf, which is nearly as large as that of the *Victoria*, is rimless, but pro-

Sanderæ. But little did they think that the next one to flower, and which comes from the collection of Hamar Bass, Esq., Byrkley Lodge, Burton-on-Trent, and from the skilful hands of the gardener, Mr. J. Hamilton, would so markedly eclipse the original. The Hamar Bass variety I consider the richest in colour of any known *Cattleya*—the *C. Hardyana*, to which it approaches nearest, not excepted—and the flower is large and of fine form. The broad sepals and petals are of a bright light shade of purple; the varying tints of the dark velvety crimson-purple of the lip it is impossible to describe, for rose, mauve, crimson, purple, and maroon seem blended in it. There are two small yellow patches in the centre of the lip, and some rich purple lines at the base. Out of this importation flowered the magnificent *C. Warscewiczii Rothschildiana*, which is distinguished by the large labellum being entirely of a rich purplish-crimson, and without the light patches seen in every other form, which renders it a distinct variety about which there can be no dispute. The only two plants

arrangement for facilitating fertilisation by insect aid. The petals of both species are honey-yellow, the labellum of *L. volucris* is brownish-purple, that of *L. Amesiana* being spotted with reddish-brown. Reference to our illustration will show in *L. volucris*, whose erected horn-like petals give the flowers such a singular appearance, that as the flowers attain maturity the labellum approaches the stem of the plant (which somewhat resembles the labellum in colour), so that insects ascending involuntarily pass over the lip and around or over the column, and thus the fertilisation of some of the flowers is assured. *L. Amesiana* is an introduction of Messrs. F. Sander & Co., and the plant exhibited by Sir Trevor Lawrence is the first to flower in England. Other species of *Lusia* are to be found in the fine and interesting collection at Burford, one of the oldest, as well as one of the prettiest being *L. Psyche*, which we gave an illustration of in 1865, and which we now reproduce.

The *Lusias* are very easy to cultivate, any warm or intermediate-house suiting them well.

ANTHRACNOSE OF THE VINE.

IN his sectional address before the American Association for the Advancement of Science, in 1887, Professor Farlow said:—"In his treatise on the fungi which attack the species of *Vitis*, published in 1879, Pirotta enumerates 104 species of parasites. Between ten and twenty of these are fungi not found on *Vitis* alone; but this number is more than counterbalanced by species peculiar to *Vitis*, which have been described since 1879. It may be objected that some of the forms called species by Pirotta are probably merely stages of some of the other species enumerated. Admitting that this is possible, and even probable, if we deduct half, or even two-thirds, which is liberal to the last degree, we still have thirty to fifty species of fungi, at the lowest estimate, which are peculiar to six species of *Vitis*, the number included in Pirotta's observations. I have little doubt that the real number of species of fungi peculiar to the genus *Vitis* is much larger than the estimate I have just given. If the relative number of species known to occur on *Vitis* is greater than that of those known most on other genera, it is due rather to the fact that, from their importance to horticulture, they have been more carefully studied than because other genera are less frequented by special fungi." However annoying and destructive *Vitis* diseases may be, they are not of that general and national importance to this country as they are in countries over which large tracts of *Vines* are cultivated for the sake of their produce for manufacturing purposes. In such countries as France, Italy, California, Australia, &c., the loss that is caused annually by diseases of the *Vine* must be enormous, and consequently the popular interest in their causes and remedies far greater than with us.

Nevertheless, although our national interest is less than in other countries, our individual interest is considerable in all that relates to *Vine* culture. It must be admitted that, in all plant diseases, as in all animal diseases, it is essential to successful remedy, that, first of all, the symptoms should be carefully studied, and a true diagnosis obtained of the character of the disease. We must first of all determine the specific disease, and then it will be easier to discover the cause, and propound a remedy. To this end it is desirable that information should be as widely diffused as possible, and as exhaustive as possible, of the varied phases of disease in important economic plants. No other apology need be urged for continual recurrence to the subject in such a journal as this. "Knowledge is power" is true emphatically in this case, as it is in many others, and nothing else will supply its place.

These remarks introduce us to one of the *Vine* diseases which had its origin in Europe, spreading thence to the New World and Australia, scattering destruction, and sparing not, and yet leaving our own islands free. At one time known as "Charbon" or "Brenner," it settled at last into "Anthracnose," and, under the latter name, is one of the standing *Vine* diseases of the United States. It is caused by a minute fungus, belonging to a destructive genus, which contains parasites incidental to many cultivated fruits. All the green parts of the *Vine* are subject to its attacks, from spring to autumn, and present the following appearances, which may afford a clue to its detection. On the shoots it first shows itself in small brown spots slightly depressed in the centre, with a slightly raised darker border; as these spots enlarge, the centre becomes more depressed, and of a greyish colour. The bark is at length destroyed, and the woody tissue beneath presents a scorched appearance. On the leaves its effects are similar, and when the disease is virulent, both stems and leaves succumb. The severity of the disease has, however, been chiefly manifest on the fruit. There is at first a small spot on the berry, with a greyish centre, and dark brown border. These spots enlarge, maintaining a rounded outline, and intermediate between the grey central portion and the brown border there is developed a bright red band. Under the action of the parasite

the berries wither and dry, being reduced apparently to mere skin and seeds.

The particular fungus which produces these results is *Glæosporium ampelophagum*, the structure of which must be revealed by the use of the microscope. There is very little mycelium, which is found beneath the cuticle, and at length little cells or cavities, with no determinate outer wall, make their appearance; from the lower portion of these cells arise numerous short delicate threads, each bearing a spore at its summit. All trace of these threads soon disappear, and the cells are filled to repletion with the minute spores, which are apparently involved in, and held together by a kind of mucilage. Then the outer cuticle is ruptured, and the spores ooze out at the opening, and lie upon the surface like a crust, which is readily dissolved and floated away by moisture. Each spore is an oblong body (5 to 6 x 2½ to 3 μ), transparent and colourless, rounded at the ends, and sometimes contracted at the middle, and generally containing two spots,

FIG. 10.—ANTHRACNOSE OF THE VINE.

or nuclei. These spores are spread by dew or rain, to other and healthy spots, where De Bary demonstrated that they are capable of producing, within eight days, diseased and discoloured spots, like the original ones from whence the spores were derived. Professor Burrill states that "the disease can be readily transferred artificially from an affected to a healthy berry. It is only necessary to wet with water a diseased spot, and after stirring with a little brush, remove some of the water to a healthy fruit, where it may stand as a little drop. If this is done when the air is saturated with moisture, failure to communicate the disease rarely happens."* Germination takes place quite rapidly, and a germ-thread is formed, which penetrates the cuticle, so that beneath the surface the vegetative growth of a new pustule is commenced. Some idea of the size of these spores may be conceived when it is remembered that it would take four thousand five hundred of them, placed end to end, to extend one inch. Hitherto, there is no evidence that the disease has been found in Great Britain, although it has long been known in France, Germany, Italy, and Austria.

Proceed. Amer. Pom. Soc., 1885, p. 49.

It had not made its appearance in the United States until 1883, and its advent in Australia has only been determined about twelve months. Hitherto it has not been reported from the Cape.

In the United States, the reporter to the Commissioner of Agriculture states that "Anthracnose prevails most in wet seasons, and in low situations, or upon poorly-drained land. Too high manuring, especially with fresh stable-dung, seems to favour its development." Keeping in view that preventing the deposition of rain or dew upon the foliage or fruit would be security against the distribution of the disease, it has been recommended that, wherever it can be done, inclosing the half-grown bunches of *Grapes* in paper bags would be a useful protection from infection.

In some parts of Europe there is a practice of bathing or washing the *Vines* in early spring, before the buds have commenced to expand, with a strong solution, containing 50 per cent. of sulphate of iron, which is applied with an ordinary mop, or a large sponge. When the young shoots have attained a length of 5 or 6 inches, they receive a good dusting with flowers-of-sulphur, whether the disease has appeared or not. If the disease then appears, sulphur is again used, with an addition of one-third or one-half its bulk of powdered lime. If this should be ineffectual, the succeeding dustings are composed entirely of finely-pulverised lime.

It only remains to be observed, as concerning the technical aspect of the subject, that some doubt has been expressed whether the fungus described by Prof. A. De Bary under the name of *Sphaceloma ampelimum*, having spores only half the size (viz., 2½ to 3 x 1 μ), is really the same species, although it resembles it entirely in external aspect and results. We can only add that most viticulturists and mycologists now consider that there is only one species which possesses the characteristic features of the fungus of Anthracnose, which possesses, as far as recent experience goes, the larger-sized spores. We cannot attempt to reconcile the difference of dimensions, except to suggest that the smaller size may have been an error of measurement, rather than that the fungus itself should so soon have become extinct, or even so speedily evolved a higher development. M. C. Cooke.

DENDROBIUM DALHOUSIEIANUM AND ALLIED SPECIES.

THIS large-growing species is seldom seen in such good form as it ought to be, but it is such a distinct and handsome *Orchid* when well-grown and profusely flowered, that no collection should be without it. I have grown this class of *Dendrobium* for a quarter of a century, and should not like to be without them. They never fail us either when wanted for exhibition or other purposes. I had one plant of *D. Dalhousieianum* this season that carried upwards of thirty spikes of flowers, all open at one time. It is rather curious that, as far as I am aware, no *Orchid*-grower in England has been able to save seed with germinating powers from this species. I have tried to cross it with other *Dendrobiums*, and to all appearance the flowers fertilised showed by their early collapse that the operation had been effective; but the capsules did not swell, and died off in a week or more. Probably the treatment afforded them in our hothouses was not conducive to the development of seed as well as flowers.

When the flowers pass away, the plants should be placed in one of the warmest houses, and where there is a very moist atmosphere maintained. This type of *Dendrobium* requires a very long time to make the season's growth; even with all the heat we can give them, the growths are sometimes not made up by November. A very thin shade for a few hours at midday is all that is needed, and when in growth give plenty of rather warm rain-water to the roots; and after the house is shut up in the afternoon, the blinds should be removed, and the temperature by sunbeats may range between 90° and 100°. The tops of the growing stems should not be far removed from the hothouse

roof, and if syringing does not keep them free from green-fly and thrips, fumigation must be afforded. After the season of growth, a decided season of rest, in a minimum temperature of 50° to 55°, with comparative dryness at the roots, will cause them to flower freely the following season. This applies to most of the Dendrobiums, even *D. Wardianum*, one of the freest to flower of any of them, will not do so unless rest comes after growth has been made in a high temperature and moist atmosphere. I remember on one occasion being much taken with the splendid-looking growths on some recently-imported plants of *D. Wardianum*; they were stout, and some of them about 3 feet long. I saw the plants were crowded closely together, and had made their growths at some distance from the glass, trained to sticks in an upright position. I bought half-a-dozen plants, and tested their flowering against our own plants, which had made their growth in baskets and shallow pans suspended from the roof-glass, and although the growths on ours were not nearly so long, they produced quite three times as many flowers. An amateur recently complained to me that his Dendrobiums did not flower freely; I found he obtained good growths, but kept the plants in a growing condition when they ought to have been at rest. *D. Dalhousieianum* requires to have its growths when in course of formation close to the glass; the tips within 3 inches of it; and gradually tie them down as they come into immediate contact with it. There is an excellent account of this species, with coloured plate, in Paxton's *Magazine of Botany*. It flowered at Chatsworth in 1844, and at about the same time at Messrs. Loddiges' nursery, Hackney, the great Orchid emporium in those days. It was recommended to be grown on blocks with sphagnum moss over the roots; but we find it does best, with plenty of pot-room, in peat and sphagnum about equal parts.

D. moschatum and its variety *D. cupreum* or *D. Calceolaria* of Hooker, belong to the same type as the above, and require very similar treatment. *D. moschatum* was first figured in the *Magazine of Botany* in 1836, and again Messrs. Loddiges claim to have been the first to flower it. The tall stems (6 feet in length sometimes) militate against this species coming into general cultivation, and, indeed, I do not think so highly of it as of *D. Dalhousieianum*; but when well managed, a flowering plant has an excellent effect in the centre of the middle table of our Cattleya-house. The flowers are certainly very fugacious, but I have kept a plant in flower for two weeks when it was required for an exhibition by placing it in a cool part of the greenhouse, where it was well shaded. This cool treatment when the plants are in flower does not injure any of the Dendrobiums, and when they are required for a special purpose, they may be kept back in this manner. I have had *D. Wardianum* flowering in good condition in June in the greenhouse. I may add, that the flowers keep all the better when the plants are in a comparatively dry state at the roots; a dry atmosphere is also very essential, nor should the plants be placed in a current of air. *J. Douglas.*

GROWTH AND CULTURE OF AZALEA INDICA.

(Continued from vol. cxi., p. 712.)

In the present article we have to consider the results obtained during the second and third years of growth of the Azalea plants.

In the month of April of the second year, the greater number of the young plants were covered with flowers; these flowers were found to contain about 6 per cent. of dry substance, and 2.8 per cent. of nitrogen. M. Truffaut states that he was much surprised to find that the flowers of Azalea contained 44.3 per cent. of sugar in their composition, and that 30.5 per cent. of this was cane-sugar, whereas previously it had always been considered of a glucose nature.

For the second year of culture the average of plants to the square yard was 157, and these were

found to contain in their different parts the following constituents:—

Parts of Plant.	Dry substance.	In the dry substance.	
		Nitrogen.	Mineral matter (ash).
In the Leaves...	1293	24.04	33.43
.. Stems...	1007	11.27	42.30
.. Roots...	993	9.53	52.63
Total ...	3293	44.84	128.36

It is of interest to notice that during the second year of growth of the Azalea, as was observed in that of the first year, the maximum of nitrogen is found in the leaves. While, however, in the first year the quantity of nitrogen contained in the roots was greater than that in the stems, the contrary was found to be the case during the second year of growth.

The mineral substances absorbed by the Azalea from the soil during its second year were as follows:—

Mineral Matter.	In Leaves.	In Stems.	In Roots.	In Total Plant.
	Lime ...	6.31	9.18	4.12
Potash ...	2.96	6.00	4.36	13.32
Phosphoric acid ...	2.29	2.43	1.68	6.40
Iron oxide ...	0.57	0.72	0.94	2.24
Silica ...	15.37	11.50	41.05	67.93

These results prove that the Versailles leaf-mould provides even in the second year a sufficient amount of nitrogen for the requirements of the Azalea plant, although the Ghent mould places at the disposal of the plant a greater excess of this element. In regard to mineral substances, the two moulds furnish in the second year the following proportions:—

Constituents.	Ghent Mould	Maurepas Mould.
	Grammes.	Grammes.
Lime ...	110.11	55.68
Phosphoric acid ...	17.61	12.58
Potash ...	25.00	31.48

Each of these moulds provide the plants with a sufficiency of mineral food, but the Ghent soil gives much the larger quantity of lime and phosphoric acid; and it is important to note that the plants utilise more food during the second year's growth than during the first.

The author concludes, therefore, that, as during the second year's growth of the Azalea, the assimilation of plant-food is more rapid, it is necessary, for the purpose of bringing up the French moulds to the standard of the Belgian, that an application be made of phosphate of lime, with a smaller dressing of nitrate of soda.

It was found that at the end of the second period the plants had made twice as much dry-substance of roots as at the end of the third period in an equal area of soil, consequently the assimilation of food was facilitated, and explains the cause of the greater vegetative powers of the Azaleas during the second year of their culture.

THIRD YEAR OF GROWTH.

In the month of May of the third year, the Azaleas are planted in a bed of leaf-mould about forty plants to the square yard, this being the last change of soil to which they are submitted before their consignment for sale in the following September.

The amount of plant-growth produced during the third year is shown by the following results:—

(Quantities in Grammes.)

Parts of Plant.	Dry Substance.	Nitrogen in dry.	Mineral matter (a-h).
.. Stems...	578	6.45	24.19
.. Roots...	801	7.68	42.43
Total ...	2429	33.70	106.25

The mineral matter, on being submitted to analysis, gave the following constituents:—

Mineral Substances.	In Leaves.	In Stems.	In Roots.	Total.
	Lime ...	7.30	5.25	0.90
Potash ...	3.51	3.33	3.51	10.35
Phosphoric acid ...	2.72	1.39	1.35	5.46
Iron oxide ...	0.61	0.41	0.72	1.74
Silica ...	18.39	0.70	33.19	52.28

These results show that during the last twenty-seven months of their culture, the Azaleas find in the leaf-mould in which they are grown a sufficient quantity both of nitrogen and of mineral substances to supply their wants, the Ghent mould as before giving the greater excess. The soluble plant-food is much less drawn upon for nutrition than during the second year.

The general conclusions of the investigation may be briefly summarised as follows:—

1. The leaf moulds, both of Maurepas and of Ghent, are sufficiently rich in mineral constituents, and that the nitrification of the organic nitrogen is active enough to supply all that is wanted by the Azaleas.

2. Ghent leaf-mould always furnishes the plants with a greater quantity of assimilative nitrogen, of phosphoric acid, and of lime.

3. It is during the second year of culture, that Azaleas derive from the soil the maximum of nitrogenous and mineral constituents.

4. Azaleas abstract from the soil the elements following in order of prominence—silica, nitrogen, lime, potash, phosphoric acid, and iron oxide.

5. In order to imitate in France, as nearly as possible, the Belgian horticulturists, who obtain such excellent results with Azaleas, it is necessary to add to the leaf-moulds obtained from the environs of Paris a certain quantity of phosphoric acid and of lime.

After the experiments made at Versailles in 1892, a manurial application was given to a two-years-old Azalea plant, planted in Maurepas leaf-mould at the rate of 155 grains of phosphate of lime and 300 grains of nitrate of soda on each square yard, which produced a very sensible effect, causing the plant to grow with exceptional vigour. The leaves became larger, and of a deeper green colour. Two prunings were able to be performed instead of one.

For several years it has been observed at Versailles that a mixture of mould and of dried blood applied as a top-dressing, produced an analogous effect upon Azalea plants, the colour being more pronounced, and the vigour greater. *J. J. Willis.*

(To be continued.)

NURSERY NOTES.

COOMBE WOOD JOTTINGS.

GIVEN a sultry afternoon, just previous to the late welcome rains, the hot sandy activities of Messrs. Veitch & Sons' nursery, Coombe Wood, did not seem to offer the best of inducements for an inspection of the varied vegetation that covered them. A very slight glance, on getting into the nursery, showed that if water was badly required by the stock, and the drought had stopped the trans-plantation, there was nothing whatever that showed suffering which the recent rains had not already alleviated. It was remarkable that no flagging of bush or tree was observable, but honeydew abounded on some of the deciduous trees, and growth was arrested for the time.

Flowering shrubs, the real object of our visit, were but scantily revealed, and those which were seen, if well blossomed, were lacking in the tints one is accustomed to see in normal seasons. The New Zealand Broom, *Nothospartium Carmichaelia*, with light mauve-coloured flowers, was noted in several examples; and alongside of it grew a plant, 4 feet in height, of *Eulalia japonica*, with leaves narrow, and semi-pendent, and in colour white and green.

A good subject as a solitary plant for a small lawn, the centre of a bed of flowering plants, or for filling a large vase in the open air or cool winter garden. Some *Genista tinctoria* gave grateful masses of a bright yellow tint; it is one of the latest blooming of leguminous shrubs of that colour. *Rhus Cotinus* var. *purpurea* differs from the ordinary form in the pinkish colour of its inflorescence, and it flowers whilst still young and of small size, whereas the type is not so precocious. *Clerodendron trichotum* was gone out of bloom, but it had been good. *Deutzia parviflora*, with leaves rough to the touch and double white flowers, is a very desirable shrub. *Cerasus serotina* flowered unusually early, and had set fruits abundantly. This is a very fine ornamental tree. Trees and shrubs with coloured leaves in some instances show up well among the neighbouring green-leaved subjects. Of the former *Cornus Spathi*, an introduction of H. Späth, nurseryman, Berlin, is a good plant, the light yellow variegation being distinct and enduring. *Acer macranthum*, with young shoots of scarlet colour, as regards the rind, is one of the finest; the leaves are large and green. *A. Reitenbachi* and *A. Schwedleri* are two fine varieties, of large growth. *A. pseudo-platanus* (*Sycamore*) *purpurea*, so called from the fine purple colour on the lower side of the leaf, is a fine tree. The golden-leaved Alder and *Halimodendron argenteum*

perhaps, than any other Lime except that of *T. euchlora*, and it has a white felt on the lower side. The tree is truly pyramidal in form, and its leaves remain on the tree longer than those of any other species. *T. euchlora* is a good grower, and also keeps its foliage till late in the year. The bright green foliage of *Planera Kaki*, or what we may call from its appearance the Japan Elm, afforded a cheerful contrast with the dusty soil and the evergreens around. It is quite hardy, and a good grower. The collection of American and Japanese *Acers* is alone worth a journey at this season or in the autumn to behold. We remarked a fine distinct-looking Bamboo with black stem—an imported piece, which would form a capital plant for a group on a lawn, whether it grows as tall or not in this country.

ORCHID NOTES AND GLEANINGS.

CATTELEYA HARDYANA X, STATTER'S FORM.

A magnificent *Cattleya*, with white perianth-segments, the lip frilled, golden-yellow, and finely spotted in the throat, with the front lobe amethyst-purple. It is probably a natural hybrid between *C. gigas* and *C. aurea*. *Lindenia*, t. 373.

FIG. II.—LUSIA PSYCHE. (SEE P. 32.)

are both of them worthy of general planting, doing well near water. *Castanea vesca*, with white variegation, is a desirable lawn tree, the markings of the leaf being clearly defined, and remaining till the fall. *C. v. pumila* is a shrubby variety.

Of purely green-leaved trees which are in presentable condition this season, and worthy of being made use of in gardens to a greater extent than at present, we may mention the following—always premising that in better soil than that of Coombe Wood is for plants not exactly peat-loving, they will succeed even better. *Fraxinus Mariesi*, a Japanese flowering Ash with graceful habit and big leaves; *Styrax obasaia*, another large-leaved half-tree; *Acer argutum* and *A. Parsonii*, otherwise *A. japonica vitifolia*, light green foliage of pleasing form; *A. carpinifolia*, a very distinct-looking tree; *Pavia rubra*, red flowers; *Asculus macrostachya*, a shrub growing to a height of 6 feet, and usually broader than high, profusely covered with erect spikes of white blooms; *A. Hippocatanum Briottii*, with flowers larger than those of *R. H. rubicunda*. A fine plant, distinct, and of good port, is the Chestnut-leaved Beech; as is also *Gleditachia triacanthos macrocarpa*. *Koelreuteria paniculata* is a dwarf tree, with panicles of yellow blossoms, that remains comparatively unknown in gardens. It is quite hardy anywhere in these islands, is not particular as to soil, and stands drought without apparently suffering. *Tilia americana alba* is another subject which drought has little effect upon, the trees at Coombe having made fine foliage and long shoots. The foliage is larger,

LÆLIA OWENIE X.

A supposed hybrid between *L. Perrini* and *L. elegans*. Flowers rich magenta-purple; lip with a white throat, front lobe rich magenta. *Lindenia*, t. 374.

CATTELEYA AMETHYSTOGLOSSA VAR. ROSEA.

Differs from the type in having the flowers suffused with rose. *Lindenia*, t. 375.

CATTELEYA MOSSIE VAR. MENDELI. *Lindenia*, t. 376.

PIERRE POIVRE (1719—1786).

(Continued from p. 8.)

PIERRE POIVRE was able to bring fine-rooted seedlings of Nutmeg trees (*Myristica aromatica*) and a large number of Nutmegs (seeds) fit for sowing, of which Buffon and de Jussieu were able to pronounce the good quality. He was unable to procure any plants of the Clove trees without actually proceeding to the Moluccas, because the Cloves were not sold in a fit state for germination. In spite of the essential services rendered to the French Company by Poivre, he found that, owing to internal dissensions between opposing interests in that Company, his projects for the naturalisation of spices did not meet with the support which he expected. Nevertheless, with pertinacious zeal, Poivre obtained from M. Bouvet de Lozier, who was in temporary charge of the Isle of France, a small vessel of 160 tons, in which he might proceed to the Moluccas and

collect the valuable spice trees which were there cultivated.

In 1754, he embarked on board his small ship, the *Colombe*, as it was appropriately named, after the dove which Noah set adrift in the vast ocean of the Deluge to seek for the precious Olive-branch. This wretched little vessel, ill-equipped, and feebly-manned, only reached Manila ready to sink, and wanting in all necessaries. Poivre, on his arrival, found the Philippine Islands in a state of uproar, the Spanish Government being engaged in serious quarrels with the native chiefs, and the King of Yolo a prisoner in the hands of the Spanish authorities. Although two of his officers deserted the *Colombe*, Poivre, after careening and repairing that vessel, re-embarked and proceeded on his voyage to the spice islands, in the midst of seas infested with pirates, which were wont to boldly attack large and heavily-armed ships. Probably, the very insignificance and poverty of his craft ensured its safety.

On reaching Timor, Poivre made friends with the native king and Portuguese governor of that island, and they procured for him several rooted seedlings of Nutmegs, and a quantity of Nutmegs fit for planting, besides some berries of the Clove-tree (*Caryophyllus aromaticus*), ripe and in a good state for sowing, but which were found too old to germinate. Returning safely to the Isle of France, and having delivered his freight of Nutmegs to the Legislative Council of the Island, he found to his grief that his friend, M. Bouvet de Lozier, was no longer acting as Governor, having been replaced by Colonel René Magon, Sieur de la Villebague, one of the Directors of the French Company, and accordingly he obtained leave to return to Europe, where his reputation had preceded him, and on reaching France he was accorded a liberal gratuity by the Controller-general. Poivre now established himself near Lyons, in a country house, where he devoted himself to study, and to the cultivation of rare exotica from all quarters of the world. He had, since 1754, been a correspondent of the Academy of Sciences; and the savant Jussieu regarded his letters as one of the valuable records of the Academy. He was now received as a member of the Academy at Lyons, where he read his "Observations on the manners and arts of the peoples of Africa and Asia." These were subsequently printed under the title of *Voyages of a Philosopher*.

While he was making preparations for his marriage, Poivre received pressing invitations from the Government to return to the Isle of France as Intendant Ordonnateur of the Colony, and with his wife he accompanied Colonel Dumas, the Governor to Port Louis in 1767. He found the islands had fallen into a state of decay, and he worked energetically to stimulate agriculture and horticulture. His address to the colonists is still extant. He showed much activity in introducing domestic animals and cattle from the Cape, Madagascar, and India, improved the fortifications, and succeeded in making the islands thoroughly self-supporting; so much so, in fact, that when war was imminent, and an expedition of 10,000 men was despatched to the colony, the Minister de Choiseul wrote to Poivre in respect to it:—"I know well that the troops are deficient of every necessary, but you are there, and we rely on your management." Poivre showed himself thoroughly equal to the occasion, and everything needful was provided and ready for the men on their arrival. *S. Pasfield Oliver, Captain late Royal Artillery, Anglesey, Gosport.*

(To be continued.)

MOVEMENTS OF THE LEAVES OF THE SENSITIVE PLANT.

M. GASTON BONNIER has lately made an important contribution to the study of the movements of the Sensitive Plant, and has given to the world the results that he has obtained while working in the Biological Laboratory at Fontainebleau, of which he is the director.

The numerous authors who have gone deeply into the study of the mechanism of this plant are ac

variance concerning the influence atmospheric depressions are able to exercise on its movements. Dutrochet, for instance, says that when a vacuum is produced round the Sensitive Plant, the common petiole or leaf-stalk straightens out a little, while the folioles or leaflets behave as they do at night-time. Sachs, on the contrary, contends that the common petiole lowers itself a little; while M. Rabsch says that the folioles alone perform any movement.

It is a well-known fact, that if one blows gently on the leaf of a Sensitive Plant, the folioles will straighten themselves. If one blows a little harder, the petioles will draw together; and if, again, one blows still harder, the whole leaf will bend right over. When the Sensitive Plant is submitted to the action of the air-pump, and a more or less strong current of air produced, this current, independently of the depression of the atmosphere, can produce one or other of the effects mentioned above. M. Gaston Bonnier says that all these movements are in inverse proportion to those which result from the depression itself.

By manipulating the air-pump with more or less rapidity, M. Bonnier has been able to reproduce in the same plant the different movements described by the authors cited above. It will be seen that none of these descriptions correspond exactly to the effects produced by the depression alone. If a Sensitive Plant is placed in a conservatory at a temperature of 26° C., on a stand connected with the air-pump, and covered over with a bell-glass, an observer standing a little way off will see the following movements, if he have the aid of the telescope of the cathetometer:—As the pump is worked, the common petiole is raised to a position that it never attains in its normal state of wakefulness. The secondary petioles separate themselves gently from each other, and so do the opposite folioles. As M. Bonnier says, the leaves are in an exaggerated state of wakefulness, and he draws the following conclusions:—

1. A difference in the pressure round an intact Sensitive Plant immediately produces movements in the leaves which are in inverse proportion to the ordinary movements of the plant.

2. That there is a pressure above which no movements can be observed. It corresponds to the maximum point to which the leaf can raise itself.

M. Bonnier has also made some researches on the effect of the pressure in the interior of the tissues, and on the relation between this pressure and the different movements of the leaves. To measure the pressure, a peculiar kind of manometer is required; and as M. Bonnier had a number of Sensitive Plants at his disposal, he was able to arrive at conclusive results. His first proposal was to find out if a difference of pressure could be observed in the gland at the base of the pinnæ, or in the stem when the leaves were touched; and if this change took place, how it was produced!

Two Sensitive Plants, each furnished with a manometer, were chosen, as their variations of pressure at different hours of the day appeared much the same. It was found that during the ten minutes which followed after the leaves had been made to lower themselves by touching them, the pressure indicated by the manometer placed at the base gland was always less than the pressure observed in the same manometer during the ten minutes which preceded, or the ten minutes which followed. The conclusion arrived at was, that when the leaves of a Sensitive Plant are touched, the pressure is lowered in the gland, and that the pressure rises when the leaves return to their normal condition.

THE WEEK'S WORK.

THE ORCHID HOUSES.

By W. HOLMES, Gardener, Pickering Lodge, Timperley.

The chief operation during the next three months is watering the plants, some requiring copious watering, whilst others just sufficient to keep the

pseudobulba plump. There are some which must be kept quite dry at the roots. After watering come damping and syringing, a point in accordance with the conditions of prevailing weather, and affording as much ventilation as is safe, it is not easy to make mistakes whilst the weather remains so warm as at present. All Orchids, which have numerous aerial roots, need considerable dampness in the house whilst new growths are being made. I am always satisfied with a Cattleya if it have plenty of roots, and these run over the sides of pots, this being a sure sign that others inside are making progress. Again, aerial roots, such as those possessed by Vandas, Aërides, some of the Oncidium, Phalaenopsis, derive nutriment from the atmosphere during the next few months, and I make it a practice when damping down the houses in the evening to use some sort of liquid manure, and in my case it is that from the cowshed, and, failing that, a sprinkling of guano or of soot, and sometimes fish potash-manure. It will be readily understood that these things cannot always be used, the smell being disliked by one's employer and his family. Calanthe Veitchii and C. vestita plants that are in full growth should be afforded plenty of moisture at the roots, and occasionally some weak manure-water. These plants do not like syringing, but they should be grown in a hot moist house. Plants of Dendrobium chrysanthum, D. c. album, and D. Statterianum, whose flower-buds are now growing fast, should be watered freely till the flowering is past, and then kept rather dry till growth begins anew, when the warmer part of the Dendrobium-house will be a suitable place for them. Miltonia Roezlii now having finished flowering, the plants may be potted or top-dressed. Annual potting is not advisable, but the operation should be done every alternate year. At the repotting, the compost is washed from the roots, and the plants dipped in a mixture of Fir-tree oil, washing them carefully, and then rinsing them in clean water, and leaving them to drain for a time. The plants are then shifted into pots of various sizes, half filling the pots with clean crocks. The compost should consist of one-half good peat and one-half sphagnum moss, with some clean crocks well mixed with these. The sphagnum moss should be living. The dipping afforded the M. Roezlii is the only one the plants get in the year, and it is enough to rid them of yellow thrips. Odontoglossum Rossi, O. Cervantesii, O. cordatum, and O. maculatum may now be repotted, and kept on the shady side of a house till growth begins, when they should be washed in the manner above described.

THE HARDY FRUIT GARDEN.

By T. TURTON, Gardener, Maiden Erlegh, Reading.

THE RASPBERRY.—Remove early after the crop of serviceable fruit is past, the canes which have fruited so that the young ones may grow vigorously; and cut away weak canes and brood if not required at a later date for forming new plantations. If stakes are used, which I still believe to be the best method of supporting Raspberry stems—select four of the best and least damaged canes, tying them somewhat loosely to the stakes. This applies to the summer-bearing varieties, as Prince of Wales, Eastolf, Red Antwerp, Baumforth's Seedling, &c., whilst the double-bearing kinds of which the new Superlative promises to be an acquisition, must be kept netted over where birds are troublesome. Without endeavouring in some way to prolong the Raspberry and red Currant season, it is this year likely to be a very short one. Red Currants offer little difficulty in keeping in good condition, yet how worthless they are by themselves, either in tarts or as dessert fruit! Should dry weather continue, water copiously, add more mulching too, and encourage new plantations to make good canes, which the dry weather has prevented them doing.

STONE FRUITS.—So long as the weather continues so very warm, the breastwood which has pushed forth since the trees were last trimmed should be left to afford shade to the fruits of Peaches, Nectarines, and Apricots, many of the earlier varieties being more liable to be injured in the skin by strong direct sunshine than the midseason and late varieties. After the fruit of Waterloo, Amsden June, and Alexander Peaches are gathered, afford the trees a heavy root-watering and syringing, and if red-spider be present on the foliage, rather than heavily syringe it, afford a light dousing, dust over with flowers-of-sulphur by means of a distributor, or mix the sulphur with water and syringe it on the foliage. In either case it must be left on the leaves for four or five days before it is syringed off; the trees may be kept clean afterwards

by syringing them three times a week for the next two months. Heavily-cropped late varieties of Peaches, Nectarines, and Plums should receive when being watered one-sixth part of liquid manure. Copious root-waterings form the best preventative against the blue aphid on Plum trees, and this year the insect is less troublesome than usual, at least in these gardens, by reason of the necessary heavy root-waterings. The season of that fine sweet Cherry, Bigarreau Napoleon, may be much prolonged by affording the trees an extra covering of fish-netting as a shading from the sun.

WASPS.—Much annoyance and labour may be saved later on by having all wasp nests destroyed early. To effect this, gas-tar may be poured into the holes leading to the nests. When the latter is higher than the entrance, the hole may be stopped with tow dipped in the same, and a piece of turf put over all, and stamped firmly into place. To make doubly sure, make a hole directly over the comb with a crowbar, and pour tar into it.

THE KITCHEN GARDEN.

By H. C. PRINSEP, Gardener, Buxted Park, Uckfield.

CABBAGES.—A sowing of Cabbage seed should be made in all parts of the country, except the southern shires. It is the practice to sow the seed on a border from which some crop has been recently taken, but better results are obtained if a spot in an open quarter be selected. Moreover, the moisture in a border is extracted by the roots of fruit trees, so that frequent waterings become necessary. The ground should be well-prepared, and drills having been drawn at 6 inches apart, the seed should be sown very thinly, it being better to occupy a bigger bit of ground, and have strong plants, than to crowd them. When germinated, water the land freely, and if crowding is likely to happen, prick out the plants while still small. A small sowing of Red Cabbage should also be made for furnishing these for autumn planting.

SHALLOTS.—These should be lifted and spread out in an open shed, afterwards choosing the best and plumpest bulbs as sets for next season, which store away in a cool airy place; the others can be stored cool for use.

PARSLEY.—A sowing may be made at this season in an open spot, the plants to be transplanted to some sheltered place towards the end of the month of August, where they can be protected in winter. Plants from seed sown now will grow much faster during the autumn and early winter than those raised from spring-sown seed. If afforded plenty of room they will grow more freely when the winter is over, and will not flower so soon.

POTATOS.—Early varieties are now ready for lifting in south country gardens. The tubers for seed should be selected when the crop is dug up, spreading them out to become green, and storing them afterwards in a light airy place. The usable tubers should be exposed to light but for a very short period of time before storing them. Clear the ground of every bit of haulm, which burn, preparing the land at once, for Turnips or Onions, Lettuce, Winter Spinach, &c.

TURNIPS.—Where the ground is rich it is yet too soon to sow the winter crop, but in the northern parts of the country a good breadth may now be sown. It is well-known that Turnips are best when freshly drawn from the ground, but it is well to make provision for a recurrence of a winter like that of 1892-93. Thin those Turnip crops that are sufficiently forward, and keep them growing by copious waterings.

SPINACH.—There is not much demand for Spinach at this season, but when vegetables become less abundant, it will again be needed in the kitchen, and sowings should be made to keep up a small supply, thinning these early, to prevent spindling. Liquid manure may be employed freely to stimulate the plants.

SALADS.—Make sowings of Endive, and transplant any which are sufficiently large. Make sowings of the Brown Bath and Hicks' Hardy White Cos Lettuce, these varieties doing better in the autumn months than tenderer ones, especially if much rain should fall at that season. Radishes sow on a north or other cool border, also Mustard and Cress in a similar place. Attend to watering all salad plants whilst dry weather continues.

THE APIARY.

By EXPERT.

SHALLOW FRAMES.—The shallow frame, 5½ inches deep, is now largely used for the production of extracted honey, and possesses several advantages over the standard frame when used for the same purpose. Bees take to a super of shallow frames more readily in spring than they do to one containing frames of standard size, on account of the hive not being cooled to so great an extent. They are also able, for the same reason, to completely seal over the cells sooner when filled with honey so that these frames are ready for the extractor at an earlier date. Not being so weighty as standard frames would be when filled, they can be taken away from the hive bodily, and carried to the extracting room, after the bees have first been got rid of by the use of the "super clearer." They are also easier to uncup than standard frames, as the combs are built out, and brushed more evenly and regularly. About the only drawback to these frames coming into general use is that another set of apparatus must be added to the list, complicating the machinery, so to speak. It should be the aim of beekeepers, if the industry is to be made a profitable one, to do with as few appliances as possible. Before deciding on the use of shallow frames, therefore, it must be borne in mind that they can only be kept for the particular purpose of extracting, and cannot, like the standard frame, be utilised for breeding purposes in the body of the hive at any time. Two shallow body-boxes 6 inches deep, will be required to each hive, in which to work them.

EXTRACTING HONEY.—Before commencing the operation of extracting honey, everything should be got in readiness. Two uncapping knives should be provided, one of which can remain in the hot water, and be ready for use by the time the other is too cold to work with. In order to work well, they should be made as sharp as possible. To keep the water in which the knives are heated at an uniform temperature, a small paraffin-oil stove, such a make as one known as the "Beatrice" being the handiest thing to use. A strainer, to catch the cappings, can be made by tying a piece of muslin over a wide-mouthed earthenware jar, a strip of board being fastened over, on which to rest the frame while eliciting off the cappings, being necessary. To prevent the combs getting broken or damaged when in the extractor, they should be placed close up to the wires of the cage, and in turning the handle, the speed should be slow at first, gradually increasing to the full extent. As an additional precaution, it is advisable to turn the combs when about half the honey on one side has been extracted, as it is the weight of the honey on the other that causes the comb to be forced through the wires of the cage.

FRUITS UNDER GLASS.

By M. TEMPLE, Gardener, Carron House, Falkirk, N.B.

ORCHARD-HOUSES which are filled with a variety of fruits require careful management at this season, as some fruits are ripening while others are still green. If trees with ripening fruit can be removed to another structure so as to have abundance of dry air admitted at all times, the difficulty will be overcome. But trees in pots, rooting through into the soil, or planted out in beds, have to remain stationary, and the individual plants must be dealt with, so far as possible, separately. If the black aphid appears, keep it in check by repeated applications of insecticide; but when fumigation can be put in practice, it is more effectual. Gishurst Compound-soap sprayed on the affected parts, and followed by dustings with tobacco-powder while the foliage is damp, will effect this object; but ripe and ripening fruit must be duly considered. Peaches retain the colouring of almost all of the insect destroyers. "Killmright" I have seen used without discolouring fine flowers; at Dundee, a friend showed me *Odonoglossum* flowers which had been syringed with this insecticide. They showed no bad effects whatever from the liquid, but cleanliness and proper use of water are the most important items of management in orchard-houses at this season. Old Mushroom-bed materials form a cleanly mulching which can be used where half-rotted farm-yard manure would rightly be objected to. Stop gross shoots, to keep the trees evenly balanced.

PINERY.—The heat of the sun will now generally keep the temperature high enough for Pine-apples, and fire-heat need be but sparingly used for some weeks to come. In few districts (especially in the North) can the fires be allowed to go entirely out,

sudden changes to dull and damp weather rendering their use indispensable, especially where fruits are swelling. More air may now be admitted to plants in every stage during July than at any other season, and by these means the plants may be induced to grow strongly, with stiff brittle leaves, and stout stems or root-stalks, which are tolerably certain to throw up fine fruit. A close high temperature to growing plants should be avoided, the weak resulting succulent growth defeating the object in view. Plants for fruiting early next year should at this time be well forward, and their pots well filled with roots, and ready to throw up fruit in August. All suckers which are of good size (none should be small when such can be avoided) should be potted into 7-inch pots—a useful size for those of good substance. Afford them a brisk bottom-heat, and some amount of shade from bright sun till the roots have pushed freely into the new soil. Keep every part of the structure moist, but do not let water get into the hearts of the plants. Fruiters should be kept at about 70° to 75° top-heat at night, with a rise to 90° or 95° by day at shutting-up time. The warmth for the young stock should not rise above 70° at night and 85° or so at shutting up.

VINES.—The period when the berries of Lady Dowries' seedling Grape scald has arrived, and dryness, accompanied by air night and day, afford the only means we know of for warding off the evil. To this end, the heating apparatus should be kept warm during the night, and a chink of air left on. There is an idea that spotting of Grapes and scalding are the same. [Spotting is due to a fungus, and the conditions which favour the growth of the fungus are those which produce the spot. Ed.] While I have Duke of Buccleuch Grape in fine healthy condition, with no spots on the berries, a Vine of Golden Queen in a Muscat-house is much scalded, but a little more air, and less moisture, accompanied with heat in the pipes, stopped the further mischief to the Queen. The Vines of the Duke of Buccleuch are freely ventilated, and well watered during the period the berries were swelling, but when ripening begins, all were kept dry at the root, no surface dribbling at any time allowed, a damp, cold surface being conducive to the spotting of the Duke.

MELONS.—Those lately planted should be kept warm and moist till growth is free, then ventilated liberally, and an even bottom-heat maintained. When the plants are grown in pots, the temperature of the house or pit will keep the soil at the proper warmth. My plants grown on stages in pineries meet requirement very well, and this season crops which have been grown as indicated have been very abundant. The shoots should be stopped in due time, and when fruits show, the required number on a plant should be set at about the same time and in the forenoon.

CUCUMBERS.—Plants in full bearing should be well supplied with moisture at the roots, and the fruit thinned in due time. Avoid slow growth, and a cool, damp soil; and, on the other hand, want of water.

PEACHES AND NECTARINES.—The trees which are expected (during September and October) to ripen fruit under glass can scarcely be kept back this season. The ventilators should be kept open night and day. Leave no shoots but those required, and syringe freely.

PLANTS UNDER GLASS.

By BAILEY WADDS, Gardener, Birdsall Gardens, York.

ROSES.—During the present month plantations of Teas and other kinds of Roses should be made, and vacancies filled up. For this purpose strong plants which are growing in pots are best, and these do far better than winter or spring-planted ones, if attention be duly given to watering them in dry weather, and keeping them clean. The shoots obtained from these will afford good blooms the following spring, especially the varieties as Lamarque, Madame Caroline Kuster, The Bride, Maréchal Niel, Madame Falcot, Madame Lambert, William Allan Richardson, Francisca Kruger, Catherine Mermet, Réve d'Or, and Ma Capucine—the latter very useful in the bud as a button-hole Rose. Continue to water copiously Rose borders, and do what is possible to keep red-spider in check. Roses under clear glass have needed a shading of "summer cloud" or other light material. Here they grow well and flower abundantly under Hartley's patent rough glass. Pay attention to those growing in pots, which should now be plunged

in coal-ashes outside, supplied with manure-water, and freely syringed. Give the pots a turn often, to keep the roots from growing through.

FREEZIAS in pots may now be shaken out, and repotted into a mixture of good loam and leaf-mould, with manure and sand added. The bulbs should be sized, selecting those of one size for a pot, so as to have fine flower spikes of the same strength in one pot. The best size of pot is a 48, and one dozen bulbs may be put in each. They should be well-drained, the soil made firm when filled in, and the bulbs placed about a quarter-of-an-inch below the surface. After pottling, place them in a cool greenhouse or pit, and keep the soil moist, but not wet. Frezias may be pushed on in heat as required. A few imported bulbs should be added to the stock every year.

LILIUM AURATUM, and all Lilies of the lancifolium section coming now into bloom, may be afforded liquid manure, and a small amount of shade, as they do not like too much sun on the roots. Those which have flowered should have old blooms removed, and the pots plunged out-of-doors, and water afforded till the bulbs are matured, when they may be repotted, and covered with about 1 foot of coal ashes, if early bloom is looked for. *Lilium Harrisii* for early flowering may be potted as soon as possible, and covered in the same way till the bulbs are well started.

THE FLOWER GARDEN.

By T. H. CRASP.

LAVENDER.—This plant, so much prized for its agreeable fragrance, may be easily propagated at this season by cuttings made of young shoots put into porous, sandy mould, under a hand-light, placed at the foot of an east or west wall. The handlight should be shaded when the sun shines on it, and the soil watered to prevent it getting dry. Twice a week the top should be taken off for a quarter of an hour. The cuttings soon make roots, and must then get more air, and soon afterwards full exposure. They may be planted out in the autumn or spring.

CAMPANULA PYRAMIDALIS.—Seeds of this beautiful old-fashioned bell-flower, useful in the herbaceous border as well as for pot-culture, should be sown in the open ground, or in pots or pans if preferred, using a rather rich sandy loam. Pots and pans, &c., should be placed in a cold frame, kept close, and shaded till the seed germinates, then affording air in an increasing volume. When large enough to be readily handled, pot off the seedlings singly, and stand them in a place away from the sun out-of-doors, where they may remain if plunged in coal-ashes, and afforded some light protection during the winter. When April arrives, plant them out in the open ground. Seedlings raised in the open ground may be pricked off into pans, and treated similarly, or pricked off into beds on warm borders, if slugs are not troublesome, affording slight protection from frost.

CONIFERS.—Seeds may be sown at this season. The more common species may be sown in the open ground in shallow drills, and the choicer ones in pans or large pots of sandy loam in a cold frame. Previous to sowing it is a good plan to immerse the seeds in water for a day or two.

ROSES.—Briars planted last winter for Rose stocks may be budded this month, should have all the small shoots removed, leaving from one to three of the strongest and best placed for budding upon. Aphid still infests the shoots of Roses, and ought to be destroyed by means of a wash of Tobacco-water and soft-soap. Cuttings of Roses grown under glass root in a gentle bottom-heat very freely at the present time, and every cutting which can be procured should be put in at once, for it is hardly possible to be overstocked with these.

BEDDING PLANTS will require constant attention in the matter of watering should the dry weather continue. Remove decayed blooms and foliage, as when a showery time does come, work in this department will greatly increase, lawns requiring more frequent mowings, and walks rolling and weeding. The season of blooming of Iceland Poppies, Canterbury Bells, &c., will be prolonged if the seed-vessels are removed when the blooms decay. The present time is suitable for selecting the varieties of these plants, and *Godetias*, *Clarkias*, *Antirrhinums* as seed-bearers.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETINGS.

TUESDAY,	JULY 11	Royal Horticultural Society, at Chiswick.
WEDNESDAY,	JULY 12	Royal Botanic Society: Musical Promenade.
SATURDAY,	JULY 15	Royal Botanic Society.

SHOWS.

TUESDAY,	JULY 11	Wolverhampton Horticultural Society's Great Show (three days), National Carnation Society, Show in connection with the Royal Horticultural Society, at Chiswick. Harleston Rose Show, Wimbleton.
WEDNESDAY,	JULY 12	Royal Caledonian Horticultural Society (two days). Rose Shows at Tunbridge Wells and at Earl's Court.
THURSDAY,	JULY 13	Provincial Show of the National Rose Society, in connection with the Show of the Horticultural Society, Worksop, Notts. Rose Shows at the People's Palace (two days); and at Woodbridge, Suffolk.
FRIDAY,	JULY 14	Helensburgh Horticultural.
SATURDAY,	JULY 15	New Brighton Horticultural Society and Rose Show.

SALES.

TUESDAY,	JULY 11	2000 Odonoglossum Alexandrae, at Protheroe & Morris' Rooms.
FRIDAY,	JULY 14	The Giltown Collection of Established Orchids; also Palm Seeds, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—63°·3.

The fortunate visitor to the two best exhibitions of the Rose, under the auspices of the National Rose Society, that held on June 20, at the Drill Hall, James Street, Westminster, and the other at the Crystal Palace, on July 1, will have witnessed the two best metropolitan shows of the flower for the current season.

At the former, the exhibits were limited to Tea and Noisette Roses, and when the drought—which had then lasted for three months—is considered, it will be admitted that the display was of considerable merit, regarding the quality, size, colour, and finish of the blooms, and the size of the show as a whole.

To say that the blooms have not been surpassed would be a debatable statement, for 1893 has failed to be an ideal Rose year, the rain-drops and heavy dew-drops, that seem to bring out all the beauties of the flower, whilst they do really invigorate the plants and impart increased substance, and, we may assert, perfume to those flowers which possess this most desirable merit, have been absent over the greater part of the South, and a parched soil and our clumsy contrivances for affording moisture offer little compensation.

To suppose, even, that the watering-can and a mulch of manure! laid on thickly over the roots of our Roses is sufficient, is to immeasurably under-rate Nature's doings. Still, the rosarians have, in spite of the unkindly elements, done wonderfully well, and, as we have said, the Teas and Noisettes were beautiful in the middle of a rainless June; whilst at the Crystal Palace, Teas and H.P.'s were quite as good as could be expected. The exhibition was, as a whole, below its usual dimensions, owing to the inability of exhibitors to put up presentable stands of bloom, and perhaps to show such large numbers as in normal seasons.

The South countrymen had the mortification of seeing the best prizes go to the Northern and the Midland shires, whence came undoubtedly the finest and the freshest blooms; and amongst the prizes that went northward was the National Rose Society's Challenge Trophy, which fell to Messrs. HARKNESS & SON, of Bedale. The stands of this prize-winner were richer in hybrid

perpetuals than Teas or Noisettes, and in Roses of dark tints than light ones. The fine bloom of Horace Vernet in this exhibit obtained a Silver Medal. That almost new Rose of rich rose colour and grand shape when at its best, Mrs. John Laing, was likewise excellent, as were Alfred Colomb, Madame H. Jamain, Duc de Rohan, Ulrich Brunner, and Dupuy Jamain.

The next best man was Mr. B. R. CANT, who secured besides the 2nd place for seventy-two blooms, a Silver Medal for The Bride—the choicest Tea Rose shown.

The highest awards for forty-eight triplets went to Bedale, but that for as many single blooms and twenty-four singles to the Midlands.

One of the much-coveted honours—the Challenge Trophy for Amateurs, for the finest forty-eight blooms, shown in single trusses—was captured by Mr. LINDSELL of Hitchin.

Essex and Suffolk were fortunate in coming to the front in some smaller classes, beating the redoubtable Mr. SLAUGHTER from Sussex; but then Sussex has suffered lamentably from drought, and in greater degree than the eastern counties.

Speaking generally, the amateur contests were confined to residents south of the Humber, hence few prizes went North in the minor classes.

Mr. PRINCE, that strong exhibitor of Teas, was not present, and Mr. MATTOCK had to be satisfied with a third place; and Gloucestershire, another Rose centre, showed few Roses.

The Tea Roses in the large class were well shown by Mr. B. R. CANT, Mr. F. CANT, and Messrs. D. & W. CROLL of far-away Dundee, among the traders; and by Messrs. the Rev. A. FOSTER-MELLIAR, O. G. OPEN, H. V. MACHIN, Rev. H. BERNERS, JAS. PARKER, CONWAY JONES, A. TATE, Rev. J. H. PEMBERTON, and E. MAWLEY, amongst amateurs. The latter reside in a strip of the country running east and west from the German Ocean to the Severn, of less than 100 miles wide.

The sun's heat and the dryness of the air have told heavily on the blossoms of Teas and Noisettes, and in scarcely an instance were the blooms of the customary size, or with the looked-for thick substance in the petals. Some varieties seemed to have suffered less than others. These are Maréchal Niel, Edith Gifford, Comtesse de Nadaillac, Madame Lambard, Caroline Kuster, Madame Bravy, Souvenir d'Elise Vardon, and Marie Van Houtte, the cream of the Tea Roses.

Amongst new varieties, mention may here be made of that fine H.P. Mrs. R. G. Sharman-Crawford, a flower large, good in form, of a clear rose tint, rather deeper in the centre, and possessing some fragrance. Marchioness of Londonderry is of ivory-white, large, with stout petals, and fragrant. The striped rosy-purple Rose, Merrie England, has some promise, but there is the fact that it is striped against it. Helen Keller, pink in hue, and of fine shape, is a beautiful novelty, only we have already so many of this tint.

Of less new varieties, it was noted that Gustave Piganeau is finding favour with rose growers. It is an excellent, large bloom, not unlike Paul Neyron, and likely to take a high place on the exhibition table. The colour is light crimson, and it is spoken of as a Rose of floriferous habit, excellent for beds. Charles Gater is a fine crimson-coloured hybrid perpetual. Mrs. Paul (Bourbon), Duke of Fife, Paul's Early Blush, Marie Magat, Waban, were of fair quality. This by no means exhausts our list, but they are the best of the novelties shown.

As regards the summer bloom of south-country Roses, we have seen them at their best

for this season, although cooler weather and heavy rains would maintain the plants in fair bloom for some time longer, and the renewal of exhausted mulches would tend to the same result.

It was remarked at the late show that dark-coloured varieties were exceedingly rich in colour, and did not appear to have suffered as dark flowers generally do from "burning;" perhaps the cultivators had taken especial care of them.

We ought to glean some useful lessons with regard to late *versus* early pruning this season, and doubtless it will be found that early pruning unduly hastened blooming, whilst late pruning has enabled good flowers to be secured at about the present time; but we are not good at prophecy nowadays, and many will say—had we but known!

THE WHITE ROSE OF YORK, says the *Plantlore and Garden-craft of Shakespeare*, has never been satisfactorily identified. It was clearly a cultivated Rose, and by some is supposed to have been only the wild White Rose (*R. arvensis*), grown in a garden. But it is very likely to have been the *Rosa alba*, which was a favourite in English gardens in Shakespeare's time, and was very probably introduced long before his time, for it is the double variety of the wild White Rose, and GERARDE says of it:—"The double White Rose doth grow wilde in many hedges of Lancashire in great abundance, even as Briars do with us in these southerly parts, especially in a place of the country called Leyland, and in a place called Roughford, not far from Latham." It was, therefore, not a new gardener's plant in his time, as has been often stated. I have little doubt that this is the White Rose of York; it is not the *R. alba* of Dr. LINDLEY's monograph, but the double variety of the British *R. arvensis*. The White Rose has a very ancient interest for Englishmen, for "long before the brawl in the Temple Gardens, the flower has been connected with one of the most ancient names of our island. The elder PLINY, in discussing the etymology of the word Albion, suggests that the land may have been so named from the White Roses which abounded in it—'Albion insula sic dicta ab albia rapibus, quaa mare alluit, vel ob rosas albas quibus abundat.' Whatever we may think of the etymological skill displayed in the suggestion . . . we look with almost a new pleasure on the *Rosae* of our own hedgerows, when regarding them as descended in a straight line from the '*rosas albas*' of those far-off summers." *Quarterly Review*, vol. cxiv.

FLORAL DECORATIONS AT ST. JAMES'S PALACE.—In view of the marriage of His Royal Highness the Duke of YORK and Princess MAY, the chapel, corridors, staircases, and other parts of the interesting but rather depressing-looking palace, were rendered beautiful with a profusion of flowering and foliage plants. These came in chief part from the royal gardens at Frogmore, and to Mr. OWEN THOMAS, the Queen's gardener, the credit for the exceedingly pretty decoration was due. The chief feature of the Chapel Royal was the tasteful drapery of the two square pillars of the window, consisting of white and crimson *Rosae* in panels. The window was flanked with tall Bamboos, which arched over it. The recess under the window was furnished with cut flowers in tall glasses, and just above the altar an emblem was devised in white York *Rosae* on a carpet of moss. The best bit of decoration, and also the most extensive, was that of the staircase leading to the chapel. The recess or well at the side of the stairs was entirely filled with a mass of flowering plants, Palma, Ferns, Crotons, Alocasias, Caladiums, &c., the whole forming, as it were, an avalanche of beautiful things. Conspicuous were *Clethra alnifolia*, *Marguerites*—white and yellow, *Fuchsias*, *Heliotropes*, *Caroatians*, many *Hydrangea hortensis* and *H. paniculata*, *Lilium longiflorum*

Harrisi, Gloxinias, Erics, and Francoa ramosa (Bridal Wreath). Conspicuous in one corner was a fine bloom of the white variety of Nelumbium speciosum, the greatest rarity in the whole display, and of which we give an illustration, fig. 12. The colonnade was beautified by twining garlands of white and red Roses round the pillars, and suspending festoons from each pillar to the opposite wall, and baskets of Orchids from the ceiling over the festoons. Some of the windows looking east over the low roofs of the abelters in the courtyard were filled with Hydrangeas, Palms, Pelargoniums, Caladiums, Carnations, &c., with excellent effect. Immense quantities of Roses, Lilies, Stephanotis, Tuberosa, Carnations, and Gladioli were employed in the various decorations. A white Provence Rose, with a calyx almost like that of a Moes Rose, and a delicate perfume, did duty for the Rose of York, and Mr. OWEN THOMAS might well have said:—

"Then will I raise aloft the milk-white Rose,
With whose sweet smell the air shall be perfumed."

Perfumed the air certainly was, and even the London streets were redolent of Roses. What the Rose of York may have been, may be best gleaned from the quotation from Canon ELLACOMBE'S *Plant-lore of Shakespeare*, given above.

THE BRIDAL BOUQUETS.—The royal bride's and bridesmaids' bouquets were comprised of the following flowers:—H.S.H. the Princess VICTORIA MARY of Teck, the bride, carried a shower bouquet, in which the predominant flower was the old white Provence Rose, the white Carnation The Bride, Odontoglossums, Cattleyas, Orange-blossom, Myrtle and Lilies of the Valley (at this time of year scarce and very rare), interspersed with choice Ferns and delicate foliage. There were ten bridesmaids' bouquets comprised of similar flowers shaded with a pretty Cattleya Mendeli of mauve colour. H.R.H. the Princess of WALES and her daughter also carried bouquets, which were principally arranged with York Roses, white Carnations and the choicest Orchids that could be procured. T.R.H. the Prince of WALES and the Duke of York wore Gardenias in their coats. In all there were fourteen bouquets carried by as many royal princesses, a unique and unprecedented occurrence in the history of royal marriages.

BUCKINGHAM PALACE has not for many years been made to assume such a gorgeous appearance. At every turn one made, we were confronted by a galaxy of the choicest flowers. The most predominating variety of Rose was the old white Provence Rose. The Royal Banquet on Wednesday was served in the state dining-room. Here was displayed the magnificent gold plate interspersed with choice exotics. The Wedding Breakfast was served in the state dining-room, a series of round tables having been arranged in the centre of the room, and buffets on either side. At the back of these was displayed the magnificent service of gold plate. To accommodate the numerous guests invited by HER MAJESTY to the Royal Wedding, the spacious ball-room was set apart as an impromptu breakfast-room. Here some 400 to 600 guests were provided with breakfast. This room was, like the spacious state dining-room, most elaborately decorated with choice exotics; and as the state dining-room opens into the ball-room, or, as on this special occasion, it may be called, "Her Majesty's specially invited guests' breakfast-room," the effect of the combined elaborate floral display can be more easily imagined than realised. The whole of the floral decorations, including the wedding bouquets, were by Royal command entrusted to WILLS & SEGAR, of Onslow Crescent, South Kensington, who have for an unbroken period of upwards of twenty-six years supplied the floral decorations at Buckingham Palace, and for nearly twenty years to their Royal Highnesses the Prince and Princess of WALES at Marlborough House.

NATIONAL CHRYSANTHEMUM SOCIETY.—A special meeting of the General Committee and also of the Floral Committee will take place at the

Royal Aquarium, Westminster, on Friday, July 21, at 6 o'clock in the evening, to examine some frozen blooms of Chrysanthemums sent from Sydney (Australia), for the opinion of the National Chrysanthemum Society; and the transaction of general business. Members of the Society not being members of the general or floral committees are invited to attend at 7 o'clock to inspect the frozen blooms. The annual outing will take place on Monday, July 17, and those participating will assemble at Paddington Station at 8.10 A.M.; the train leaving Paddington for those playing in the cricket match, and such friends as wish to accompany the players, at 8.20. Those going by the second train should assemble at Paddington Station at 10.50 A.M.; the train leaving at 11 o'clock. Trains leave High Wycombe at 8 o'clock and 9.10 A.M. Arrangements have been concluded for a match of cricket to take place between members of the Aylesbury Floral and Horticultural Society and of the National Chrysanthemum Society; also to view the State Rooms of the Abbey, to look over the grounds and gardens, and to inspect the chairmaking factory of Mr. W. BIRCH, Denmark Street, near the Abbey. The charge for the day, inclusive of railway journey to and from Paddington Station, and dinner and tea on the grounds, will be 8s. 6d. Ladies are especially invited. During the afternoon, Mr. F. W. MILES, the proprietor of the Red Lion Hotel, will convey visitors to Hughenden Manor.

NATIONAL ROSE SHOW AT WORKSOP.—We are desired by Mr. J. SNOW WHALE to make the following known to our readers:—"I shall esteem it a favour if you will allow me to make the following communication to intending exhibitors through your column:—To the train leaving King's Cross at 10.40 P.M. of July 12, the Great Northern Railway Company has kindly consented to attach a special van for Rose-boxes. This train will take up at Hitchin. It will be met at Worksop, where it arrives at 2.18 A.M., and the boxes can, if exhibitors so wish, go direct to the show-ground and be placed in charge of a night watchman. The next train out of King's Cross is 5.15 A.M. (morning of July 13). This, Mr. COCKSHOTT, the Superintendent of the line, tells me is one of the heaviest and fastest trains of the day, and on that account it will not be practicable to attach to it an extra van. Mr. COCKSHOTT will, however, make arrangements for conveyance of exhibitors' boxes by this train, if I can give him some idea of the number of boxes, and from what stations they will require to be conveyed. The train will take up at Retford at 8.20, and reach Worksop at 8.31 A.M. There is another train from Retford at 8.23, reaching Worksop at 8.40 A.M., and exhibitors joining the M. S. and L. system at Retford (especially those bringing much cargo) will find more accommodation by it than by the express. From Sheffield, exhibitors will find a van for their boxes on the train leaving at 7.15 A.M., and I am asking the Midland Company to make due provision on the train leaving Nottingham at 6 A.M., and Mansfield at 7 A.M. I shall be much obliged if exhibitors intending to make use of the 5.15 A.M. train will at once let Mr. GEORGE BAXTER (our Hon. Secretary, 69, Bridge Street, Worksop) or myself know as near as may be what they will bring with them, and where they will join the trains, so that I may be able to reply to Mr. COCKSHOTT'S inquiries. No doubt, so far as the Railway Company is concerned, the 10.40 P.M. train is best. It will be a help to the local committee to know the number of boxes they will have to meet by the other trains, but this is of less consequence."

GARDENERS' ORPHAN FUND.—The Committee met at the Horticultural Club, on the 30th ult., but no business transacted was of a formal character. There was a good attendance of members.

INTERNATIONAL BOTANICAL CONGRESS.—An International Botanical Congress will be held at Madison, Wis., U.S.A., beginning August 23, 1893, and continuing three or more days. All botanists are eligible to membership, and are earnestly

requested to attend the sessions, so far as possible. A membership fee of two dollars will be required. The purpose of the Congress is the presentation and discussion of botanical questions of general interest relating to the advancement of the science. It is expected that the International Standing Committee on Nomenclature, appointed last year at the Genoa Congress, will present its first report at this time. Papers embodying research will not be received, but such papers, whether by American or foreign botanists, may be presented before the Botanical Section or the Botanical Club of the American Association for the Advancement of Science, which holds its annual meeting preceding that of the Congress (August 17 to 24).

EMIGRATION.—We have received the following for publication from the Emigrants' Information Office, 31, Broadway, Westminster, S.W.:—

"Emigrants to Canada should start at once; there is a good demand for farm hands during the next two or three months, but after September the demand falls off. Government Agents now travel with Emigrants on trains going from Quebec to places west of Lake Superior, in order to give them advice and protection *en route*.

"Work in New South Wales, especially in towns, continues to be very scarce. The Government have reduced the salaries and numbers of their employes; wages have also been reduced in collieries and other private establishments. The best openings are for men who are experienced in fruit-growing, in the drying and packing of fruits for export, in the management of irrigated and unirrigated orchards, in wine-making, and in the manufacture and packing of butter and cheese. Domestic servants continue to be in steady demand throughout the colony. The towns of Victoria, and especially Melbourne, are full of men seeking work, and no working-man should go there at present. Several strikes have occurred, and salaries and wages, both in the public service and in private establishments, have been reduced all round. With the object of providing employment, and drawing men away from the overcrowded towns, the Government have thrown open more land for settlement, and have taken steps to initiate village settlements, to construct two or three country railways, and to assist the formation of Labour Colonies. In South Australia the demand for labour is very small, and has been badly affected by the depression in the mining industry, and the low price of wheat and wool. In Queensland the depression at Brisbane, Ipswich, Townsville, and other places still continues. The only demand for any kind of labour is for domestic servants, to whom the Queensland Government gives free passages from this country.

"In Western Australia the chief demand is for female domestic servants, who are offered free passages, for farm-labourers, and labourers on the Midland and other railways and public works under construction; the building trade is dull. In Tasmania, there is considerable depression in all trades at Hobart. Plenty of good labour is to be had in the Island at 5s. a day. New Zealand is in a prosperous condition, and offers many advantages to settlers. In Cape Colony a Labour Commission is now enquiring into the alleged scarcity of farm and other labour, and as to the advisability of encouraging the introduction of European emigrants. Trade has been bad at Kimberley, but at Cape Town the construction of the new sewerage works will provide work for many. In British Bechuanaland the railway is now being extended from Vryburg to Mafeking. In Natal there is no special demand for labour. New land regulations have been issued under which cultivation is no longer made a condition of occupation by purchasers of Crown Lands. Agricultural farmers and their families are now given assisted passages to the Colony on certain conditions.

"Official information has been received, that an Agent has been sent from Brazil to induce two thousand Scotch emigrants to go to the State of San Paulo in that country. In view of the suffering and loss of life, which have been occasioned by previous schemes of this nature, all persons are again most strongly warned not to go to this or any other part of Brazil."

A BIG OUTING.—The employes of Messrs. SMITH & CO., St. John's Nurseries, Worcester, had their 19th annual excursion on Monday the 19th ult. Llandudno was the place chosen for this year's outing, and accompanied by their wives and friends, the whole party numbering 450, travelled by way of the Severn Valley in a special train.

UNIVERSITY OF OXFORD.—In the first public examination in mathematics, JAMES FRANK HUDSON, Jesus College, is placed in the first class in the honours school. The fortunate winner of this honour is the son of Mr. J. HUDSON, gardener to Messrs. ROTHSCHILD, Gunnersbury House, Acton, and a frequent contributor to these columns.

RED CURRANT.—Mr. E. J. LOWE sends us specimens of the finest variety we have yet seen. The bunches measure about 4 inches in length, or, only

counting the fruit-producing portion, $3\frac{1}{2}$ inches, the number of berries on each cluster varying in the specimens before us from 15 to 18. The largest berries measure fully half an inch in diameter, are not quite globose but slightly depressed at the top, and of a dark red crimson colour. The flavour is not so acid as that of some other varieties. Mr. Lowe tells us that this handsome variety was the result of a cross between Raby Castle and the Cherry Currant.

ROYAL BOTANIC SOCIETY: EVENING FETE —

The favourable weather attracted a numerous company to the gardens of the Royal Botanic Society on Wednesday evening, the occasion of its annual evening fete. The spectacle presented was as brilliant as in previous years, and as the illuminations were on a more magnificent scale, the evening could hardly fail to be one of great enjoyment. The table and other decorations were, for the most part, extremely good, and constituted a great feature. The magnificent collection of Roses from Messrs. Wm. Paul, Waltham Cross, and the herbaceous flowers from Messrs. Creals' nurseries at Crawley, and from Messrs. Barr & Son, of Covent Garden, added materially to the brightness of the exhibition.

MARKET GARDENING UNDER GLASS.

(Continued from vol. xiii., p. 714.)

MR. EDMUND ROCHFORD, CHESHUNT.

A PLACE at present consisting of some 10 acres of glass, and situated about half a mile nearer Cheshunt station than that of Mr. T. Rochford's noticed in vol. xiii., p. 714. We give the locality, but would advise any who are contemplating making a visit to be sure that they will be granted admittance, for it is pretty generally understood that visitors are not greatly desired in these market-supplying establishments. All time and attention are centred upon growing the most suitable kinds of fruit and flowers, to the highest degree of condition, and at the least possible cost, and to presenting them at the market in the same condition they are in when leaving the establishment. A visit to the packing-sheds quickly convinces one of the importance attached to this operation in the best managed gardens. They are packing Tomatos, and these are sorted out into two and often three qualities. If the consignment is composed of one variety only, they will be put up as three samples, but two qualities. Thus, all perfect fruits will be classed into two samples, and both of these may be called "bests," and the other will be composed of fruits that are ill-shaped, or have some little disqualification. They are packed into small round hampers, each containing 12 lb., and are covered over with paper, the colour of which varies with the samples, and is understood as well by the buyers as by the producers. There must be no such thing as "topping"—a word used in the trade to describe the practice of placing a few superior fruits on the top—or the reputation of the sender is soon lost. The same care and attention is given to the packing of everything sent away, and in this direction has been made as great progress from the old system of non-selection as that made in any branch of the trade.

The first house we entered with Mr. Rochford was one on the ridge-and-furrow system. It has nineteen divisions, each of which is 260 feet long and 28 feet wide. The whole of this immense house is planted with Vines; they are only about two years old, and are just bearing a few bunches as their first crop. The centre of each division is planted with Tomatos, fruiting in the most liberal manner possible. Other houses, consisting of sixteen divisions, contain Vines about six years old. Most of these were bearing capital crops, but particularly some houses. In these the bunches and berries were quite extra, and the crop such as one seldom sees. Of varieties there were but three represented, Black Alicante, Muscat of Alexandria, and Gros Colmar.

There are fifty-seven divisions, varying from

90 feet to 120 feet in length, devoted to Cucumbers. Many of them have borne a first crop, and after giving a few more fruits, will give place to a batch of young plants that are being prepared for the purpose. Adiantum Ferns are a large feature here; they are grown for supplying fronds chiefly, and not so much for the plant trade. About 7000 plants of *Solanum capsicastrum* are in 5-inch pots, and are already covered with blossom.

Indian Azaleas and a large stock of zonal Pelargoniums, variety Raspail, are kept for supplying cut flowers. Plants for window furnishing and general decoration are grown in large quantities for spring supply. In respect to the fruit, the output of Grapes this year will be about 28 or 30 tons, but as so many of the Vines are only just coming into bearing condition, it will in two years be equal to 70 tons. The supply of Tomatos last season was about 75 tons, and of Cucumbers in the season about 1200 dozen are sent away each week. The best systems of heating have been adopted, and of supplying an unlimited quantity of water to the establishment. In all there are 112 houses, beside several pits.

(To be continued.)

NOTICES OF BOOKS.

POULTRY FOR THE TABLE AND MARKET. By W. B. Tegetmeier, F.L.S. (Field office, Bream's Buildings, E.C.)

THAT this work has reached a second edition is in itself a proof of its practical utility. The author has improved it with additional chapters and illustrations, and it is altogether a book which every poultry-fancier should obtain.

THE BOOK OF CHOICE FERNS. Parts 17 and 18.*

The work nearing completion lacks nothing of its former excellence of detail, and when it is completed it will be a great boon to gardeners and planters. Part 17 continues the genus *Notholaena*, and deals with *Oleandra*, *Onychium*, *Ophioglossum*, *Osmunda*, and *Pellaea*. Part 18 finishes *Pellaea*, *Platynerium*, and *Platyzoma*, and gets well on with the large and somewhat troublesome genus *Polypodium*. Part 17 gives fine coloured illustrations of *Lomaria discolor bipinnatifida*, *Hymenophyllum pulcherrimum*, and a view of the central avenue of the conservatory, Chatsworth. Part 18 gives a coloured plate of *Polypodium glaucophyllum*, and fine full-page illustrations of *Nephrodium lepidum* and *Lygodium japonicum*, and in both numbers, as in the preceding, the principal species are well illustrated throughout.

FLORISTS' FLOWERS.

GERANIUM MACRORRHIZUM.

I HAVE had for two or three years a plant of this species that was in flower all May. It thrives equally well in the mixed border or on the rockery; is only a few inches high, with a circumference of 4 feet, and very floriferous. The flowers are a dark rose-red, two or three on a stem; leaves palmate, with the fingers widely spread. The habit is not herbaceous, but shrubby. I recommend the plant to the favourable notice of any amateur

* *The Book of Choice Ferns for the Garden, Conservatory, and Stove.* (London: L. Upcott Gill.)

who may find it in a catalogue. It flourishes at a time when flowers in the mixed border are scarce. I believe I had it from Mr. Thompson of Ipswich. *C. Wolley Dod, Edge Hall, Malpas.*

CYCLOPS PINK.

It surprises me to find, judging from the visitors to my garden, that the Cyclops Pink is so little known. It is not a florist's flower, being strictly single, but it is novel, distinct, and ornamental. In substance it seems intermediate between single Pink (*Dianthus plumarius*) and Carnation (*D. caryophyllus*). The flowers are round and large, 2 inches across, with the petals a little indented, of various shades of purplish-pink, and a large eye of deep purple, from which, I suppose, it takes its name. The flowers grow on stiff stalks, less than a foot high, and whilst in this garden double Pinks and Carnations, if they flower at all, invariably burst and tumble about in great untidiness, this single flower is neat, whether growing or cut. The flowering lasts through June and July, and though apt to run into forbidden colours, a selection may be made to avoid this fault, as the plant grows easily, either from seed or cuttings. Mr. W. Thompson of Ipswich introduced it to me, either by seed or seedlings, three or four years ago, and I know nothing more of its history. Some of the single garden forms, or hybrids of *D. plumarius*, with long fringed edges and dark eyes, seem to lead up to this variety, which in size and substance far surpasses anything I have before seen in single Pinks. *C. Wolley Dod.*

LATHYRUS ROTUNDIFOLIUS.

Suffer me to put in a plea for the more extended cultivation of that showy perennial Pea *Lathyrus rotundifolius*. It needs to be planted in good soil in an open position, and then when assisted by a spring mulching of manure, the plant grows into a large bush, and blossoms with remarkable freedom, its bright carmine flowers being very attractive. The plants rapidly increase in size, and add annually to the abundance of its brilliant blossoms. Like most, if not all, the Everlasting Peas, brilliant sunshine operates to bleach its blossoms, but there is always a large surface of brilliant colour presented to view when the plant is at its best. Some years ago, I got a form of it under the name of *Lathyrus Drummondii*, which I take to have been a seminal variety of *L. rotundifolius*, but differing slightly in that the blossoms are rather deeper in colour, and it does not seed so freely. But of the great decorative value of either form there can be no doubt. *R. D.*

A TRAVELLER'S NOTES.

(Continued from vol. xiii., p. 570.)

MIYANOSHITA: May 2, 1892.—Since I left Yokohama, a week ago, it has rained every day except one. Not only has it rained every day, but in almost every instance, the entire day.

I first went to Kamakura, chiefly celebrated for its great bronze figure of Buddha, known as the Daibutsu, the interior of which is used as a temple. The figure is $49\frac{1}{2}$ feet high and 97 feet in circumference; but perhaps you may form a better idea of its size from the following dimensions (the whole is, of course, in proportion): circumference of thumb, 3 feet; length of eye, 4 feet, the eyes are said to be of pure gold. The figure is formed of sheets of bronze, cast separately, and welded together.

The Temple of Hachiman is also prettily situated near the same village, and approached through a fine avenue of Pines, which loses itself in two young groves of *Cryptomeria*. In front of the temple is a fine and historically famous Ginkgo nearly 20 feet in diameter; and not far distant on the banks of a Lotus-pond, are three Willows, stated by a guide-book to be nearly 700 years old.

Ilex integrifolia was flowering well in this part of the country, and so freely as to make it really pretty, large close bushes, some 20 feet high.

I clambered up the hill behind and found an Iris growing and flowering freely. I have since seen it in other places in far greater quantity.

Round this village and in the temples, Rhododendrons, *Dendropanax japonicum*, Cherries, and Maples

(*palmatum*), are not uncommon. The temples alone have a few red Maples. Barley and Beans here, as in the whole Hakone district, are largely cultivated; the former looks magnificent. Rice is still backward.

At the next place I went to, I spent the night; it is a peninsula at low, an island at high water. On arriving, and going to the best native inn, we were informed the Empress was expected on the morrow, and we could not be taken in. We found quarters elsewhere, my first experience of eating and sleeping in Japanese style. Regarding the former,

Empress did not come. I went around the island—only a few hilly acres covered with an undergrowth chiefly of low Bamboo beneath Pines and Oaks. My next idea was to ascend Mount Ozama, 4100 feet. I got into an inn and waited one and a half days to go up the mountain, but when the third day opened with continued rain, it became clear I might wait for weeks, so I came away. The mountain is ascended by a series of steps, some three, four, or five every 50 yards or so, and is said to be a most fatiguing climb.

From Ozama I came here—a well-known health

flowering freely, and Violets were very common. The commonest plant of all was perhaps the one known as the Man's Bamboo, with short, stiff, slim, close stems some 3 to 4 feet in height. This covers the sides of many hills. *B. senanensis* is also met with. Around this district, known as the Hakone region, it is usual, in the early months of every year, to burn the low forest on the sides of the hills—many are, therefore, now bare, having as yet scarcely recovered. Near Lake Hakone is a fine avenue of *Cryptomeria japonica*, they must be over 100 feet high, the stems quite straight, and very

FIG. 12—THE WHITE FORM OF *NELUMBIUM SPECIOSUM*: USED IN THE WEDDING DECORATIONS AT ST. JAMES'S PALACE. (SEE P. 39)

I heartily support the opinion of Murray's new guide-book, "Many who view Japanese food hopefully from a distance have found their spirits sink and their tempers embittered when brought face to face with its unsatisfying actuality." Rice, fish, Bamboo and soup are good, and with a few things of one's own, one can do pretty well.

Sleeping accommodation is comfortable except the pillows, which are either of wood or of hard rammed straw. One sleeps on four, and under one padded quilt, and tries not to think who slept there before. These quilts are very warm and comfortable; but needless to say, the animal kingdom is largely represented.

Next day it rained the entire time, and the

resort—with sulphur springs and European hotels (managed by Japs). On the road we came through a magnificent avenue of Pines lining the old Toleaido route—the most frequented and famous road in the whole empire before the revolution of 1868 and the introduction of railways. About Miyanoshita, which itself is in a hilly district some 1400 feet above sea level, are several pretty walks to be made and mountains to be ascended—in fact, a flat walk is almost unobtainable. I have taken the two principal walks, one to Lake Hakone and back by the crater of Ojigoku, the other to the Temple of Saijōji.

The lake, a very pretty one surrounded by hills, is situated about 5 miles from here. On the road there, *Pyrus japonica*, only a few inches high, was

close together, seldom more than 6 feet between each tree, often closer. In order to return to Miyanoshita, I rowed across the lake, and noticed a pretty Azalea in flower on the banks. Its blooms are pale reddish-purple, perhaps rather washy, but they are produced freely, and when reflected in the water from the banks above are rather pretty. On approaching the crater of Ojigoku, or "big hell," the path is lined with *Pieris japonica*, usually about 20 feet high. It is growing in a very straggling manner, its reddish-brown main stems being the most striking feature. I noticed a good deal of seed on these plants. The crater is a large open space, devoid of vegetation, and reeking of sulphur.

The Temple of Saijōji is perhaps a more interesting

excursion. One first ascends some 3000 feet to Myojin-ga-take, and then descends to 1400 feet, where the temple is situated, and has been there for nearly 500 years. Violets were flowering prettily all over the slope, and on and near the summit only were a dwarf Aster and a brown Adonis, both unknown to the guide and people in the village below. The Aster was rather small, perhaps an inch in diameter, and of the usual Aster blue. The Adonis was fair-sized, and the brown of a distinct pleasing shade. On nearing the temple we passed down a gorge, in which were great bushes of Aucuba vera, flowering freely, with branched panicles, growing in the shade of Cryptomerias, and with plenty of moisture they were wonderfully luxuriant. The temple is surrounded by a great grove composed of many hundreds of magnificent Cryptomeria japonica, with stems varying from 3 to 6 feet in diameter. It contains many buildings, staircases, and courtyards spread over a considerable area. In one of the courtyards is a nice clump of the black Bamboo, nearly 20 feet high; whilst growing around on every side in the wildest profusion, is the Iris described in the earlier part of this letter—thus flowering in quantity, it is singularly effective. *James H. Veitch.*

(To be continued.)

HOME CORRESPONDENCE.

EARWIGS.—I should think that if "C. C. B." (June 24, p. 754) were to strew a mixture of finely-sifted fresh-slacked lime and soot over his lawn, when damp, it would have the desired effect. Perhaps it would be better to do so at a time when the earwigs congregate thereon. I have never tried this remedy on earwigs, but I have on other garden pests with complete satisfaction. *H. W. Ward.*

A TULIP TREE IN A GARDEN.—Probably the finest specimen of a Tulip tree to be found in the United Kingdom is the one growing in the centre of the kitchen garden of The Hiraal, Lord Home's Berwickshire seat. Planted two hundred years ago, it has grown into a wide-spreading tree, a very conspicuous object in the view. Mr. Cairns, the gardener, put the tape around it at 2 feet up, and it girthed 23 feet. I question if it reaches a greater girth even in its native country, North America. The Liriodendron is beautiful at all seasons—in the spring when it puts forth its large bright green leaves, later on when it is covered with flowers, and in the autumn when the leaves become a bright yellowish colour. *Vagabond.*

THE DROUGHT, AND WATERING.—In reply to "D.," p. 750 of *Gardeners' Chronicle*, June 21, I have used a fire-hose lately for watering as much as possible, and find it efficacious, the water used being in limited quantity was only available occasionally, and for a small part of the garden, but the benefit derived was immense, and greatly in excess of ordinary watering by means of watering-pots. The water was forced about 80 feet into the air, above the plot of ground to be watered, and descended like a heavy shower of rain, besides being warmed in its descent. The advantage of thoroughly soaking the whole of the land as far as the hose will reach is very great, the water being warmer than if supplied by means of a watering-pot, the air surrounding the plants cooled, and the plants refreshed for a considerable time if the watering is done of an evening. If we should get a succession of seasons like the present one, the water supply in many gardens will require putting in an efficient order. *W. H. Divers, Ketton Hall Gardens, Stamford.*

TROPÆOLUM POLYPHYLLUM.—This plant deserves all that "Vagabond" says in its praise in the *Gardeners' Chronicle* of June 24, p. 750. It is certainly one of the most beautiful of our hardy flowers, and when well established, it grows and flowers profusely, and does not seem particular as to soil. I have seen it growing well on limestone and on clay; but if the plant at Scone bears "trefoil" leaves, it is very different to the one which I have always seen under this name. It fails to grow in some instances from the attacks of the small black slug and its relations, which seem to have an unerring appetite for it when it first starts into growth, and I am not certain that the tuberous root is able to withstand severe frost, unless it is planted deeply or protected. As a British gardener, I would like to inform "Vagabond" that we do not deserve the slur he attempts to cast upon us, as I know of four places, within a short distance from Ketton, where the plant is well

grown; it is therefore not "neglected by every gardener except Mr. McKinnon. *W. H. Divers, Ketton Hall Gardens, Stamford.*

BONES AS DRAINAGE FOR CHRYSANTHEMUMS.—Mr. Dean's note on the above was of much interest to me, as I experienced the same thing with some large Crotons growing in pots that I had drained with bones in February last. The plants went on well for a fortnight after the repotting, and then began to droop. Thinking the ball must be dry, a good soaking of water was afforded, but they became worse, and the leaves began to drop. On turning the plants out of the pots, the bones were observed to be quite decayed, and run together, a putrid mass, with an unbearable stench. Every root that had come in contact with or near the bones was dead. The plants were repotted, and have not yet quite recovered their vigour. I may here say that these plants were drained with bones for years, in exactly the same manner as this year. On making a complaint to the seller, I was told they were extra strong, and that I must be a novice, and did not know the use of them, with which I quite agreed. I was pleased that the discovery was made early in the season, or all my Chrysanthemums would have been drained with these bones. *Hackwood.*

AZOLLA: A CORRECTION (p. 15).—Will you kindly allow me to say that careful examination and comparison with Strasburger's and Campbell's figures makes it almost certain that the species sent you is *Azolla filiculoides*, not *A. pinnata* or *caroliniana*. *Greenwood Pin.*

PROLIFEROUS TREFOIL.—Your notice of a prolific Strawberry induces me to send you a remarkable instance of a prolific Trefoil, in which all the florets are transformed into young shoots. It was growing in the heart of a Strawberry plant. The bed has been watered with manure-water. Perhaps a great check, and then a sudden stimulus, may in some part account for it. *Geo. Wall.* [A very good example of the substitution of leaves for flowers. This Clover, *T. repens*, is very subject to the change. *Ed.*]

FRUIT GROWING AT ONSLOW HALL.—The cultivation of fruits at the above place is being carried on with energy and intelligence, the information given by the county council lecturer having evidently afforded the gardener a decided stimulus in this direction. The Apple and Pear trees in the open quarters of the garden, bushes as well as pyramids, espaliers, and trained trees, have been partially lifted, the roots pruned as regards the larger ones, and some of the sandstone rock, which contained a large quantity of iron, was removed from about them, its place being taken by suitable kinds of soil. The trees bear evidence of the beneficial nature of the work done, the present season's growth looking of a healthy colour. The caterpillars have given infinite trouble this year, but having been kept under, the damage done is not great. The crops of Apples and Pears are good, and in many instances they have had to be thinned, as also the fruits on Plums and Apricots on wall trees. The paths over the roots next to the fruit wall were mulched with manure upon which burnt earth or refuse, of which a quantity was kept in an open shed ready for use. This is a valuable manure for fruit trees, a fact which the writer has proved for years past in Kent. This burnt earth, &c., was put over the mulchings of other fruit trees in the open quarters, the manurial constituents being carried to the roots by rain and artificial waterings. Splendid crops of White and Red Currants and Gooseberries (Red Warrington) were noted upon trees trained on a north wall, and much care was bestowed upon these fruits. I noted the following varieties of Apples showing promising crops: Ribston Pippin, Irish Peach, Gladstone, Waltham Abbey Seedling, Cox's Orange Pippin, Duchess of Oldenburg, Keswick Codling, Lord Suffield, Lord Grosvenor, Court of Wick, Tower of Glamsay, Northern Greening, Blenheim Orange Pippin, Margil, King of the Pippins, Golden Noble, Lord Derby, Warner's King, Grenadier, Wellington, Ecklinville Seedling, Lane's Prince Albert, and Bismarck. Pears in good bearing were Winter Nelis—a variety that is thought much of and found to do well here, Marie Louise, Jargonelle, Louise Bonne of Jersey, Duchess d'Angoulême, Doyenné du Comice, Josephine de Malines, Olivier de Sérres, Beurré Diel, Williams' Bon Chrétien, Gloat Morceau, and Catillac. Large supplies of soap-suds and farm-yard liquid manure find their way to the fruit trees. The Strawberries, which

were doing well out-of-doors, were Noble, President, Sir Harry, and Waterloo. This last, considered to be one of the best late varieties, was planted in large numbers upon a northern aspect. John Ruskin is condemned because of its liability to get mildewed. Mr. Backhouse, the head gardener at Ouslow, is a ready worker for the development of hardy fruit cultivation, and the fruit trees under his care bear testimony to his determination to follow improved methods. *R. S.*

RAISING NEW VARIETIES OF CYPRIPEDIUMS.—I find that it takes about nine months to ripen the seeds of these plants from the date of fertilisation, and about the same length of time to germinate; and from one seed-pod I have had two plants, which flowered the second year, whilst others, out of the same pod flowered in the fourth year. From one lot of seed the plants and flowers will vary in size and colour, and some will be more robust than others. I have a large number of crosses, and my late employer, Major Marwood, who was a great lover of Orchids, gave me much encouragement in the matter of raising new varieties. Of these I may mention *Cypripedium Marwoodi* × *niveum*, as seed-bearer, crossed with *C. Harrisianum*. It has three flowers on one stem, and is in the way of *C. Aylingi*—the best I have ever seen. *C. Horneri* = *C. Spicerianum* the seed-bearer × *C. Harrisianum*, very good. *C. variety* = *C. Boxalli* seed-parent × *C. Lawrenceanum*, a very good large flower. Two of this cross have flowered. *C. variety* = *C. ciliolare* × *C. Spicerianum*, the seed-bearer. No. 5 seedling is a very good-looking plant, but it has not flowered; it was obtained by crossing *C. Curtisii* the seed-plant, with *C. Roezlii*. I have several others which I expect will flower this season. The *C. niveum* seed-parent was crossed with *C. Druryi*, and the seed resulting from this cross was sown in September last year. It is now germinating. I shall be glad to furnish further information on this subject if you would care to publish it. *H. Horner, Marwood Yard, Flowergate, Whitby.*

SOCIETIES.

NATIONAL ROSE, CRYSTAL PALACE. Southern Section.

JULY 1.—The chief show in the South of the National Rose Society was held on Saturday, July 1, at the Crystal Palace, one-half of the nave being taken up with the tables of Roses and a few miscellaneous exhibits. Remarks on the show as a whole will be found on p. 8 of the present issue.

NURSERYMEN'S CLASSES.

It had been generally anticipated that, owing to Roses being so unusually early this season, the growers from the North would give a good account of themselves, and this proved to be the case, for whether in H.P.'s or Teas, the fine collections from Yorkshire were not to be beaten. The Challenge Trophy and 1st prize in the leading class for seventy-two distinct varieties was secured easily by Messrs. Harkness & Son, Bedale, Yorkshire. The stand was stronger in its H.P.'s than in its Teas and Noisettes; some of the former were really of first form, such, for instance as the bloom of Horace Vernet, which was awarded the Silver Medal for the best H.P. shown by a nurseryman, and the extremely beautiful "Mrs. John Laing"—a perfect bloom. The complete list of this exhibit was as follows:—Duke de Rohan, Baroness de Rothschild, Madame H. Jamain, Alfred Colomb, Souvenir de S. A. Prince, Duchess of Bedford (good), Countess of Oxford, Jean Ducher, Duke of Wellington, Prince Arthur, Francisca Kruger, Etienne Levet, La France, Crown Prince, Mr. Harkness, Edward Andry (very fine), Souvenir d'Elise Vardon, Camille Benardin, Merveille de Lyon, Violette Bouyer, Madame V. Verdier, Louis Van Houtte, Catherine Mermet, Le Havre, Merrie England, Ernest Metz, Earl of Dufferin (good), Gloire de Margottin, Comtesse de Nadaillac, Mons. E. Y. Teas, Ulrich Brunner, M. C. Kuster, Auguste Rigotard, Dupuy Jamain, Marie Verdier, Beauty of Waltham, Viscount Folkestone, Chas. Darwin, Madame G. Luizet, Madame E. Verdier, Horace Vernet, Mrs. John Laing, Boule d'Or, Victor Hugo, Harrison Weir, Etoile de Lyon, Fisher Holmes, Marquise de Castellane, General Jacqueminot, Princess Beatrice, Reynolds Hole, Lady Mary Fitzgerald, Margaret Bridet, A. K. Williams, Exposition de Brie, Madame C. Crapelet, Gustave Piga-

neau, Dr. Andry, Innocente Pirola, Sir R. Hill, Duke of Fife, Cleopatra, S.-M. Rodocanachi, Chas. Lefebvre, Comte de Raimbaud, Madame Bravy Duchesse de Morny, Bartholomew Joubert, and Comte de Serenye. The 2nd position was taken by Mr. Benj. R. Cant, of Colchester, whose exhibits were not up to his usual standard. The best were A. K. Williams, Charles Lefebvre, Louis Van Houtte, Alfred Colomb, Maurice Bernardin, Annie Wood, Sultan of Zanzibar, and The Bride. This latter also obtained the Silver Medal for the best Tea shown by a nurseryman. Mr. Frank Cant, also of Colchester, who took the 1st prize in this class last year, was 3rd.

In the class for forty-eight distinct single trusses, Mr. Henry Merryweather, Southwell, Notts, was 1st, with a very good lot, including fine specimens of Horace Vernet, Comte de Raimbaud, Sir R. Hill, Charles Lefebvre, La France, of 1889 (a very nice colour), The Bride, and Marie Baumann. 2nd, Messrs. G. & W. Burch, Peterborough, whose best blooms were Gustave Piganeau, Comtesse de Camondo, Niphotos, Marie Rady, Duchesse of Bedford, Alfred Colomb, and Marchioness of Dufferin. Messrs. Perkins & Sons, Warwick Road, Coventry, were 3rd, and showed Lady Sheffield, Her Majesty, and Duke of Wellington, in good form.

Messrs. Harkness & Son were again 1st for forty-eight distinct varieties, three trusses of each, with a stand very superior to those which occupied 2nd and 3rd position. Sir R. Hill, Duchess de Morny, and Duchess of Bedford were especially noticeable. Mr. Frank Cant's Roses were a pretty lot, but much smaller; the best were Reynolds Hole, Duchess of Teck, Marie Baumann, Fisher Holmes, and Innocente Pirola. Mr. B. R. Cant was 3rd.

The 1st prize for twenty-four single trusses, distinct, went to Nottinghamshire, to Mr. W. H. Frettingham, Beeston. The Roses were very well coloured and of good size, particularly A. K. Williams, Lord Macaulay, Marie Baumann, Ferdinand de Lesseps, and Her Majesty. Mr. Jno. Mattock, of New Headington, Oxford, was 2nd in this class, showing good blooms of The Bride, Madame Cusin, Horace Vernet, Marie Baumann, Mrs. Jno. Laing (very large and good), Ulrich Brunner, &c. Messrs. D. Prior & Sons, Rose growers, Colchester, were 3rd.

For twenty-four distinct varieties, three trusses of each, Messrs. G. & W. H. Burch, Peterborough, competed successfully. Their best were Duke of Wellington, A. K. Williams, Horace Vernet, Alfred Colomb, Ulrich Brunner, Marie Baumann, and Comte de Raimbaud. The stand included several very weak blooms, particularly Madame Eugène Verdier and Xavier Olibo. Mr. W. H. Frettingham, of Beeston, had a stand containing exceptionally well-coloured blooms, and if it had not such large blooms as several in the 1st prize collection, the general quality appeared to us to be better than that; Mons. E. Y. Teas, Duke of Connaught, Her Majesty, Duchess of Bedford, Reynolds Hole, and Jean Lilleverre (rarely seen shown), were the best. Mr. Geo. Mount, of Canterbury, was 3rd; his best were Annie Wood, Eugène Furst, and Camille Bernardin.

AMATEURS.

The redoubtable amateur, Mr. E. B. Lindsell, Bearton, Hitchin, who has been successful in the leading class for several years, again took 1st prize and the Challenge Trophy for the best forty-eight distinct single trusses. The varieties were—Duchess of Morny, Prince Camille, Camille Bernardin, Xavier Olibo, The Bride, A. K. Williams, Madame J. Desbois (weak), Dupuy Jamain, Catherine Mermet, Sir R. Hill, Caroline Kuster, Lady Sheffield, Louis Van Houtte, Etienne Levet, Reynolds Hole, Comte de Raimbaud, Souvenir d'un Ami, Merveille de Lyon, Countess of Oxford, Marie Van Houtte, Beauty of Waltham, Abel Carrière, La France, Gustave Piganeau, Ethel Brownlow, Chas. Lefebvre, Levenne Lamy, Her Majesty, J. S. Mill, Innocente Pirola, Alfred Colomb, Ulrich Brunner, François Michelin, Comtesse de Nadaillac, Rosieriste Jacobs, Madame E. Verdier, Earl of Dufferin, Maréchal Niel, Prince Arthur, Mrs. John Laing, Duke of Wellington, Madame Cusin, Dr. Sewell, Marie Verdier, Madame Hoste, Fisher Holmes, and Horace Vernet. 2nd, Rev. J. H. Pemberton, who had also a fine lot, but flowers smaller. Mr. Henry V. Machin, Gateford Hill, Worksop, Notts, was 3rd.

The Rev. A. Foster-Melliard, Sprouton Rectory, Ipswich, was the best exhibitor of thirty-six distinct single trusses, and amongst a good collection the best were Alfred Colomb, Marie van Houtte, Ethel Brownlow, Souvenir d'Elise Vardon, E. Y. Teas,

Marie Verdier, Merveille de Lyon, and La Havre. These were not quite so good as those in the 1st prize collection of the forty-eight varieties. Walter Drew, Esq., The Uplands, Ledbury, was almost equal to the 1st in this class; his stand included very good specimens of Marie Baumann, Her Majesty, A. K. Williams, La Rosière, and Louis van Houtte. The Rev. J. H. Pemberton was 3rd; his best were J. S. Mill, Charles Darwin, Le Havre, Her Majesty, and A. K. Williams.

The 1st prize for twenty-four distinct single trusses was secured by J. Gurney Fowler, Esq., Woodford, Essex, with an exceptionally well-coloured lot. The best were Le Havre, Duke of Connaught, Earl of Dufferin, and A. K. Williams. Colonel J. H. Pitt, Turkey Court, Maidstone, was 2nd; the blooms were large but too far developed. E. B. Lindsell, Esq., showed well again in the class for sixteen distinct varieties, three trusses of each; the best were Lady Sheffield, Horace Vernet, A. K. Williams, Duke of Wellington, Dupuy Jamain, Louis Van Houtte, Alfred Colomb, and Prince Arthur. Henry V. Machin, Esq., was 2nd; his blooms were not so large or good, but they were staged nicely, each flower being given plenty of room.

The next class was for twelve distinct varieties and three trusses of each, and here Walter Drew, Esq., showed fine and well-coloured blooms, but some of the petals appeared injured. The 2nd prize collection from Colonel J. H. Pitt, Turkey Court, Maidstone, was also commendable.

Walter Drew, Esq., had the best twelve single trusses of any H.P., showed very fine Mrs. Jno. Laing; the 2nd prize going to S. P. Budd, Esq., 8, Gay Street, Bath, who had Marie Baumann; and the 3rd to H. V. Machin, Esq., for La France.

NUMERICALLY LIMITED CLASSES.

The following five classes were open only to growers of fewer than 2000 plants of varieties in the National Rose Society's Catalogue of Exhibition Roses, including Teas and Noisettes.

The Rev. H. Berners, Harkstead Vicarage, Ipswich, took 1st in the leading class of this section for twenty-four distinct single trusses. The best were Marie Baumann, A. K. Williams, Reynolds Hole, The Bride, and Jean Souper. A. Slaughter, Esq., Steyning, Sussex, was 2nd, noticeable were Prince Arthur, Duchess of Bedford, Maréchal Niel, and Lord Macaulay. The 3rd prize went to W. C. Romaine, Esq., The Priory, Old Windsor.

For eighteen distinct, A. Whitton, Esq., Askens, Bedale, was 1st with a very good collection. Thos. Miller, Chas. Lefebvre, Countess of Rosebery, Dupuy Jamain, Duke of Wellington, Viscountess Folkestone, Marie Baumann were all fine blooms. James Parker, Esq., Oakfield, Hitchin, was a good 2nd, with smaller, but pretty, bright, and well-shaped blooms; Mr. E. Mawley, Rosebank, Berkhamstead, was 3rd.

For twelve distinct varieties, the 1st prize went to Jno. Ough, Esq., 7, Clifford Street, Hereford, who was the only competitor in this class.

The Rev. H. Berners was in the 1st place in the competition for eight distinct, three trusses of each; his Merveille de Lyon, Her Majesty, Camille Bernardin, were fairly good. A. Slaughter, Esq., Steyning, Essex, was 3rd.

For nine single trusses of any H.P., also the Rev. H. Berners was 1st, with large and pretty blooms of Merveille de Lyon; 2nd, W. C. Romaine, Esq., with Dr. Andry; and A. Whitton, Esq., was 3rd, with Merveille de Lyon.

The following four classes were open only to growers of fewer than 1000 plants, of varieties in the National Rose Society's catalogue. In this section, Osmond G. Orpen, Esq., West Bergholt, Colchester, took the 1st prize in the leading class, and also the *Gardeners' Magazine* Medal. The best of the twelve blooms were Alfred Colomb, Baroness Rothschild, Horace Vernet, Camille Bernardin, but some weak ones spoiled the appearance of the stand. C. J. Grahame, Esq., Coombe Road, Croydon, was 2nd, with very fresh and nice blooms, only inferior to the other collection in having no large blooms; the general quality was better. Jas. Parker, Esq., The Croft, Headington, Oxfordshire, was 3rd; and Dr. Tucker, Swanley Junction, Kent, 4th.

For nine distinct single trusses, the 1st position was taken by Conway Jones, Esq., Hucklecot, Gloucester; his best were Catherine Mermet, and Alfred Colomb. 2nd, M. Hodgson, Esq., Shirley Cottage, Croydon; and 3rd, Chas. E. Cathwell, Esq., Chapel Croft, Dorking.

Jas. Parker, Esq., was 1st in the class for six

distinct Roses, three trusses of each. His Alfred Colomb, Earl of Dufferin, and Monsieur E. Y. Teas were very good. Miss Mellish, Hudsons Priory, Worksop, was 2nd; and Dr. Tucker, Swanley, 3rd.

Dr. Tucker had the best six single trusses of any H. P., showing very fine blooms of Her Majesty. The 2nd position fell to James Parker, Esq., who also showed Her Majesty, but not more than one half the size, and M. Hodgson, Esq., was 3rd with Alfred Colomb.

The three following classes were open only to growers of fewer than five hundred:—

Mr. L. P. Trines, Hitchin, took 1st for nine distinct single trusses; the best were Her Majesty, Alfred Colomb, Etienne Levet, Duke of Wellington, Mrs. Jno. Laing. 2nd, Geo. Moules, Esq., Hitchin, who had good blooms, especially Marie Baumann and Camille Bernardin. Harcourt P. Landen, Esq., Shenfield, Brentwood, was 3rd.

W. D. Freshfield, Esq., Reigate, had the best six; Comtesse de Nadaillac, Duke of Teck, Mons. E. Y. Teas, and Jno. Bright were very good. The Rev. R. Buchanan, Herne Vicarage, Canterbury, was 2nd; and F. S. Francis, Esq., Crofton Hall, Orpington, was 3rd; his bloom of Alfred Colomb was a very fine specimen, and the exhibit generally appeared equal to that which gained the 2nd prize. 4th, Miss E. B. Denton, Orchard Court, Stevenage.

For four distinct varieties, three trusses of each, Mr. E. B. Denton, Orchard Court, Stevenage, was most successful; F. S. Francis, Esq., 2nd; and A. F. Grace, Esq., Chertsey Green House, Steyning, 3rd.

EXTRA CLASSES FOR AMATEURS.

Arthur Bryans, Esq., The Cottage, Foots Cray, Kent, had the best six distinct single trusses, in a class open only to amateurs who have never won a prize at an exhibition of the National Rose Society, amongst which were good specimens of Alfred Colomb, Comtesse de Nadaillac, and Madame V. Verdier. 2nd, A. F. Grace, Esq.

For six distinct single trusses of Roses grown within 8 miles of Charing Cross, John Bateman, Esq., Rosevale, Archway Road, N., was 1st, who staged a fair lot, including a commendable bloom of Ulrich Brunner. 2nd, Rivers H. Langton, Esq., Raymead, Hendon, N.W.; and 3rd, Hugh White, Esq., Woodside Cottage, Highgate.

The following class was for six new Roses, distinct, single trusses, and here the Rev. J. H. Pemberton, was 1st, showing Elsie Fugier, Jeannia Dickson, Gustave Piganeau, Carolina Testout, Auguste Guinoissean and Duchess of Fife. 2nd, John Bateman, Esq., Roseville.

TEAS AND NOISETTES.

The Teas were far below the usual standard of excellence. The drought and heavy rains had sadly marred the beauty of their flowers, and the competition was not so keen as on previous occasions. This portion of the exhibition, generally the more beautiful, was quite disappointing. Such well-known growers as Mr. Prince of Oxford were unable to compete through the feeing character of the blooms.

NURSERYMEN.

The leading class in the Teas and Noisettes was arranged for twenty-four distinct varieties, single trusses, and the leading honour was secured by Mr. B. R. Cant of Colchester. Unfortunately, the blooms were not so good as usually staged in this section. The best were Ethel Brownlow, Souvenir d'Elise, Ernest Metz, Madame de Watteville, Catherine Mermet, Madame Cusin, Innocente Pirola, Francisca Kruger, and a very fine bloom of The Bride. Mr. Frank Cant was 2nd; his best were Niphotos, Ethel Brownlow, and Catherine Mermet. 3rd, Messrs. D. & W. Croll, Dundee.

Mr. Henry Merryweather, Southwell Nurseries, Notts, was 1st for eighteen distinct single trusses, and the blooms were better than those shown in the class above. They were Maréchal Niel, Niphotos, Princess of Wales, Perle des Jardins, Devonensis, Ethel Brownlow, Comtesse de Nadaillac, Anna Olivier, Ernest Metz, Etoile de Lyon, Souvenir de Annie Rubens, Souvenir d'Elise Vardon, The Bride, Francisca Kruger, Catherine Mermet, Madame S. Cochet. A good collection, but slightly smaller blooms, were shown by Messrs. D. Prior & Son, who were 2nd.

Another class was arranged for twelve distinct trusses of any Tea or Noisette, except Maréchal Niel, and in this the winners were Messrs. D. and W. Croll, Dundee, with pretty moderately good blooms of Rubens. Messrs. G. and W. H. Burch showed well-shaped, but small Innocente Pirola, and were

2nd. Messrs. R. Mack & Son, Catterick, Yorkshire, had *Souvenir d'Elise Vardon*.

In the class for eighteen distinct triplets, the first place was taken by Mr. B. R. Cant. The best of a moderately good collection were Catherine Mermet, Ethel Brownlow, *Souvenir d'Elise Vardon*, Comtesse de Nadaillac, *Maréchal Niel*, Madame de Watteville, and The Bride; 2nd, Mr. G. Mount, with fresher-looking blooms, but smaller, Niphotos, Innocente Pirola, The Bride, and Comtesse de Nadaillac, were the best. Mr. Frank Cant was only a short way behind, and very noticeable were his blooms of Madame Cusin, The Bride, Ernest Metz, and *Souvenir d'Elise Vardon*.

The Rev. A. Foster-Melliard, Ipswich, secured the Trophy for eighteen blooms, with a stand containing some of the best blooms in the show. It consisted of the following varieties:—*Maréchal Niel*, Ernest Metz, Ethel Brownlow, Madame Cusin, Hon. Edith Gifford, Innocente Pirola, Jean Ducher, *Souvenir d'un Ami*, Marie Van Houtte, Madame Hippolyte Jamain, Caroline Kuster, Comtesse de Nadaillac, Catherine Mermet, *Souvenir de S. A. Prince*, The Bride, Comtesse Panisse, Anne Olivier, *Souvenir d'Elise*. Mr. O. G. Orpen, Colchester, was 2nd.

AMATEURS.

Two classes were provided for twelve varieties, distinct, one for single trusses and the other for triplets. For the former, the Rev. H. A. Berners, Harkstead Rectory, Ipswich, was 1st, with a very fresh and even exhibit, the varieties comprising Ethel Brownlow, Francisca Kruger, Comtesse de Nadaillac, Marie Van Houtte, Madame Hoste, The Bride, Catherine Mermet, Madame Bravy, Madame Cusin, Etoile de Lyon, Jean Ducher, and Hon. Edith Gifford. Col. J. H. Pitt, Turkey Court, Maidstone, was 2nd, with fairly good blooms, the finest being *Souvenir de Thérèse Levet*, The Bride, and Marie Van Houtte. In the triplet class, the 1st prize, a piece of plate, was well won by the Rev. A. Foster Melliard, Broughton Rectory, Ipswich. The flowers were of good colour, not so lamentably washed out as in the majority of stands. They included *Maréchal Niel*, Hon. Edith Gifford, Comtesse de Nadaillac, Comtesse Panisse, Madame Lambard, Caroline Kuster, *Souvenir d'Elise Vardon*, Francisca Kruger, Ernest Metz, and Marie Van Houtte. H. V. Machin, Esq., Gateford Hill, Worksp, was 2nd, but his blooms were unfortunately much damaged. We rather like them on the black velvet ground; it shows up the delicacy of colouring.

NUMERICALLY-LIMITED CLASSES.

Open to growers of fewer than five hundred plants of Teas and Noisettes in the National Rose Society's catalogue. In another class for twelve distinct, single trusses, the 1st prize, a piece of plate, was presented by the Rev. F. R. Burnside, and G. O. Orpen, Esq., West Bergholt, Colchester, was successful, with moderately good blooms for the season. They were Comtesse de Nadaillac, Madame de Watteville, *Maréchal Niel*, Innocente Pirola, Catherine Mermet, *Souvenir de S. A. Prince*, The Bride, Madame Hoste, *Souvenir d'un Ami*, Marie Van Houtte, Madame Lambard, and Francisca Kruger. The 2nd prize went to James Parker, Esq., The Croft, Headington, Oxfordshire, and were of very good colour, but a trifle coarse. Those, however, from Alfred Tate, Esq., Downside, Leatherhead, were, in our opinion, better. Conway Jones, Esq., Iluclecote, Glos., 4th.

In the class for nine distinct single trusses, the 1st prize went to the Rev. J. H. Pemberton, Ilaving-atte-Bower, Essex, and the flowers were praiseworthy, the varieties comprising Caroline Kuster, Ernest Metz, Hon. Edith Gifford, Comtesse de Nadaillac, Jean Ducher, Mme. Bravy, Marie Van Houtte, and Mme. Hippolyte Jamain. Ed. Mawley, Esq., Rosebank, Berkhamsted, was 2nd, with creditable but small flowers. The *Gardeners' Magazine* Silver Medal was awarded to Mr. Pemberton in this class.

For six, distinct, three trusses of each, O. G. Orpen, Esq., was 1st, with very good blooms, fresh, and in true character, and consisting of Innocente Pirola, *Souvenir d'un Ami*, *Maréchal Niel*, Francisca Kruger, Mme. Bravy, and Marie Van Houtte. No blooms of special merit were to be seen in the 2nd prize stand from J. Parker, Esq.

An interesting class was for six distinct single trusses of any Tea Rose, and the variety *Maréchal Niel* was well shown by O. G. Orpen, Esq., who was placed 1st; the blooms were of very fine colour, and amongst the best in the exhibition. J. Parker, Esq., was 2nd, with The Bride; and Dr. Tucker, Swanley Junction, Kent, 3rd, with Hon. E. Gifford.

Open only to growers of fewer than 200 plants of Teas and Noisettes in the National Rose Society's catalogue. The 1st prize for nine, distinct, single trusses, was secured by Dr. Tucker, who had small but excellent blooms of Comtesse de Nadaillac, The Bride, Catherine Mermet, *Souvenir de Thérèse Levet*, Hon. Edith Gifford, Innocente Pirola, Rubens, and Marie Van Houtte; Miss Mellish, Hodsock Priory, Worksp, was 2nd, but the flowers call for no particular comment; and W. D. Freshfield, Esq., The Wilderness, Reigate, 3rd.

The 1st prize for six, distinct, single trusses, went to Mr. A. Whittton, Askew, Bedale; the flowers very beautiful, large, and thoroughly well-grown. They comprised Madame Hoste, *Souvenir d'Elise Vardon*, Catherine Mermet, Rubens, Innocente Pirola, and *Souvenir de S. A. Prince*.

In the other stands nothing in particular called for mention, but we may record that F. S. Francia, Esq., Crofton Hall, Orpington, Kent, was 2nd; the Rev. J. R. Buchanan, Herne Vicarage, Canterbury, 3rd; and George Monlea, Esq., Hitchin, 4th.

OPEN CLASSES.

This section was full of interest, and contained some of the finest flowers in the show. They made a great display of colour, and the competition was, as a rule, good. Unfortunately, the Teas were much spoilt by the weather. This was the case with the blooms of Madame Hoste, which won the 1st prize for Mr. B. R. Cant, Colchester, in the class for twelve single trusses of any yellow Rose. Messrs. D. & W. Croll, Dundee, were 2nd with Marie Van Houtte, very charming; and Mr. John Mattock, New Headington Nursery, Oxford, 3rd.

There were five entries for the same number of any white variety, and Merveille de Lyon was the principal exhibit; it was shown by Messrs. R. Mack & Son, Catterick, Yorks, in excellent style, full, but not coarse. Messrs. Harkness & Sons, 2nd; and Messrs. D. & W. Croll, 3rd. All the classes were for twelve blooms, distinct, single trusses, so we need not specify the number in each case. For any crimson Rose, except Marie Baumann or A. K. Williams, the English Fruit and Rose Company, Hereford, were 1st, with very fine blooms of Alfred Colomb; and Mr. George Mount, of Canterbury, was 2nd, with Fisher Holmes in good character; whilst Messrs. Paul & Son, Cheshunt, were 3rd, with Alfred Colomb. There were eight entries in this class.

A very fine class was that for the dark velvety crimson Roses, and the blooms of the variety Fisher Holmes, which won Messrs. Prior & Son, Colchester, the 1st prize, deserve praise for fulness and depth of tone, not large, but neat and pleasing. That lovely kind, Xavier Olibo, one of the sweetest of all this section, came from Mr. Frank Cant, who was 2nd; with Mr. George Mount 3rd, for Eugène Furst. *Maréchal Niel* was well represented. Twelve fine trusses were shown by Messrs. D. Prior & Son, and gained the 1st prize; they were conspicuous for colour, fulness, and finish. Those from Mr. G. Mount, who was 2nd, were also satisfactory, and O. G. Orpen, Esq., was 3rd. Some of the classes were reserved for twelve blooms of one variety (stated in schedule), and it is interesting to note how popular some kinds are than others. Thus there were ten entries in the class for that thoroughly useful variety Mrs. John Laing, but the flowers were not so fine in colour as usual; the hot sun had dimmed their lustre. The 1st prize box was from Mr. J. Mattock, whose flowers were very even, closely followed by Messrs. Harkness & Sons; the 3rd place being occupied by Messrs. G. and W. H. Birch. That old favourite, Marie Baumann, was shown by Mr. George Mount, who was 1st in this class, his twelve flowers amongst the best of this kind in the exhibition; whilst the Colchester growers were the other prize-winners, Mr. F. Cant 2nd, and Mr. B. R. Cant 3rd. We have seen A. K. Williams in far better character than on this occasion, but the dozen flowers from Mr. R. Mack were commendable, although they quickly lost colour through the heat. Those from Messrs. Perkins & Sons, Coventry, who were 2nd, were small; Mr. B. R. Cant, 3rd.

We were surprised to see only two entries in the class for twelve blooms of Niphotos, the best coming from Messrs. G. & W. H. Birch; they were fairly good, but much spoilt; Mr. G. Mount was 2nd. The variety, Her Majesty, was well represented, and there was good competition. The finest dozen blooms, quite typical of this H.P., came from Mr. B. R. Cant, but, unfortunately, sullied by the weather; Messrs. G. and W. H. Birch 2nd, and Mr. Geo. Mount 3rd. That delightful Tea-scented variety, Ernest Metz, was well shown by Mr. B. R. Cant, who had the best

twelve flowers, full, fresh, and solid; those from Mr. F. Cant, who was 2nd, being damaged. The previous grower, Mr. B. R. Cant, also had the most typical blooms of Ethel Brownlow, fresh, of good colour, and pleasing; Mr. Geo. Mount 2nd, and Mr. F. Cant 3rd.

We were pleased to see no fewer than eleven entries in the class for twelve blooms of any H.P. not named in the schedule. The best exhibit was Fisher Holmes, splendidly shown by Mr. F. Cant; whilst Mr. Geo. Mount was 2nd with the same variety, and Mr. B. R. Cant 3rd, with Alfred Colomb. One class was for six single trusses of Catherine Mermet, and The Bride, arranged alternately. The 1st prize went to Mr. George Mount, and Mr. B. R. Cant was 2nd.

A class was provided for single-flowered Roses, nine bunches, and Miss Mellish was 1st with such kinds as Paul's Single White, Rosa lucida, R. arvensis, and R. canina. Not the least interesting class was for twelve bunches of Roses, suitable for button-holes, and the 1st prize went to Mr. Mattock, who had delightful blooms for colour and fulness of Innocente Pirola, W. A. Richardson, l'Idéale, Comtesse de Nadaillac, Souv. de Paul Neyron, Niphotos, Madame Capucine, Catherine Mermet, Madame de Watteville, and The Bride. Messrs. Keynes, Williams & Co., Salisbury, 2nd; and H. V. Machin, Esq., 3rd.

GARDEN ROSES.

Nurserymen.—This was a very important and beautiful section of the show. The chief class was for thirty-six bunches, and the 1st prize was won by Messrs. Paul & Son, Cheshunt, who had very fine masses, comprising many charming, old-fashioned kinds. The above we are pleased to see again getting popular. The more conspicuous was the Noisette Gustave Regis, a delightful flower, especially in the bud, new, and very sweet; the Noisette Pierre Cochet, a free sweetly-scented, and beautiful bloom; Rosa rugosa, and its varieties, particularly Madame Georges Bruant, which has large paper-white flowers; the now popular l'Idéale, Rosa lucida, the Provins, Camoens (a very free and pretty kind), Aimée Vibert, and the semi-double crimson-flowered Reine Olga de Wurtemberg.

AMATEURS.

The Silver Cup, offered by Lord Penzance, for the best eighteen bunches, was well won by A. Tate, Esq., who had such fine old kinds as Bardou Job, Moschata nivea, White-crested Moss, the Polyantha class in variety, common China, Rosa macrantha, Homère, and the H.P. Gloire des Rosomanes, a semi-double carmine variety; the Rev. J. H. Pemberton was a good 2nd, but quite eclipsed by the splendid bunches from Mr. Tate; Mr. H. V. Machin 3rd, and Miss Mellish 4th.

Chas. E. Cuthell, Chapel Croft, Dorking, had the finest twelve bunches, consisting of the several forms of Rosa rugosa, Paul's Single White, Pink China, Rosa macrantha and R. lucida; O. G. Orpen, Esq., 2nd.

NEW ROSES.

This was the most important section of the exhibition, as one always looks to this annual show for the finest novelties. There were three Gold Medal Roses, and awarded to the following varieties:—Mrs. R. G. Sharman-Crawford, and Marchioness of Londonderry, both from Messrs. A. Dickson & Sons, Newtownards, co. Down, Ireland. The former is a hybrid perpetual variety, and from what we can see, is a splendid acquisition. It is, of course, difficult to judge of a new Rose from flowers only, as other points have to be considered, but the variety Mrs. R. G. Sharman-Crawford—too long a name, we may remark—is full of promise; the flower is large, finely-shaped, the petals broad, and shining rose in colour, deepening in the centre, whilst the fragrance is fairly pronounced. This is a great point. It is a bright telling colour on the exhibition-board. Marchioness of Londonderry was scarcely shown in proper character; it is a fine Rose, and raised by the firm in 1886, but not sent out until comparatively recently. It is a very large flower, the petals broad, stout, with the margin reflexed, and the colour is best described as ivory-white. It possesses also a sweet and powerful fragrance, and the plant is strong in growth, the leaves of a glossy green colour. Although reminding one of Merveille de Lyon, it is amply distinct, and a very handsome exhibition Rose. We may remark as of interest that this is the first time two Gold Medals have been awarded to the same exhibitor for new Roses on the same occasion.

It was inevitable that a Gold Medal would be

given to the beautiful Polyantha Rose, named *Crimson Rambler*, of Mr. Charles Turner, Slough. This variety is now well known. Its flowers are produced in great profusion, in dense clusters, each like a little rosette, and intense crimson in colour. A new seedling Rose was shown by Mr. Frank Cant, but the flowers are too much like those of *Bardon Job* to merit great attention; they are similar in shape and colour. Messrs. Harkness & Sons had two new Roses, one named *Merrie England*, and the other *Mrs. Harkness*, both hybrid perpetuals; the former is of the *Fride of Reigate* class, the flower large, rosy-purple, and striped; but we want few of this type. *Mrs. Harkness* is a promising light-coloured flower, which we hope to see again. Messrs. A. Dickson & Son had also a variety named *Helen Keller*, the flower rose in colour, full, and handsome.

There were several other classes for new Roses. One was for twelve single trusses, and the finest blooms were those from Messrs. Harkness & Sons, the variety being *Gustave Piganeau*, which has become one of the most popular exhibition Roses. Mr. F. Cant and Mr. B. R. Cant were 2nd and 3rd respectively with the same kind. The competition was good.

A special award was given to the flowers of *Mrs. R. D. Sharman-Crawford*, from Messrs. A. Dickson, twelve fine blooms being exhibited.

Another interesting class was for twelve new Roses, distinct, single trusses, but the flowers were not in very good character. The 1st prize went to Messrs. Paul & Son, who showed *Gustave Piganeau*, *Noisette Gustave Regis*, *Charles Gater*, a crimson H.P.; the *Bourbon Mrs. Paul*, a very fine Rose; H.P. *Duke of Fife*, not very promising as shown; *Paul's Early Blush*, H.P., the flowers pink in colour; H.P. *Marie Magat*, crimson; the *Tea, Waban*, which has been much discussed, but which seems disappointing; *Bruce Findlay*, *Dowager Duchess of Marlborough*, *Violet Queen*, and *Frère Marie Pierre*, all H.P.'s, but they were not in condition to judge of them with any degree of accuracy.

PREMIER BLOOMS.

That for the best H.P. exhibited by nurserymen was given to Messrs. Harkness & Sons, for a bloom of *Horace Vernet*, a good large flower, but colour not quite normal—purple-blue being rather highly developed.

For the best Tea, Mr. B. R. Cant was successful with a nice bloom of *The Bride*. The best H.P. from the amateurs was a large bloom of *Ulrich Brunner* from Mr. E. B. Lindsell; and the best Tea, a magnificent bloom of *Madame Cusin*, from the Rev. A. Foster-Melliar.

MISCELLANEOUS.

A fine group of *Begonia tuberosa* varieties, circular in form, was arranged by Messrs. J. Laing & Sons, Forest Hill, S.E. Among the *Begonias* were several novelties, as *Prince of Wales*, single-flowered, bright crimson; *Lottie Collins*, flesh-pink; *Princess May*, *Earl Craven*, double, dark crimson; *Duchess of Westminster*, carmine, with white centre as single flower. Other exhibits were the pretty *Saxifraga sarmentosa tricolor superba*, *Carex*, *Palma*, and other furnishing materials.

Messrs. H. Cannell & Sons, Swanley Junction, had a showy table of cut flowers, consisting of double and single-flowered varieties of *Begonia*, set up in triplets in glasses with a setting of *Adiantum*.

Messrs. J. Cheal & Sons, nurserymen, Lowfield, Crawley, had a triangular shield, covered with dark-coloured velvet, on which small bouquets of *Violas* in variety were arranged. With these they had a quantity of the best herbaceous perennials as cut flowers, consisting of *Chelone*, *Delphiniums*, (*Enothra Youngii*, *Phlox*, *Gaillardia*, *Sidalcea*, *Carnations*, *Hemerocallis*, *Lychnis*, *Telekia cordifolia*, &c.

Messrs. Paul & Son, nurserymen, Waltham Cross, had a big stand at one end of the exhibition space, which was lavishly set out with baskets and boxes of cut blooms of *Roses*, these being interspersed with plants of *Arundo Donax variegata*, coloured tree foliage, *Ferns*, &c. It was very well done.

CROYDON HORTICULTURAL.

JULY 5.—This annual exhibition was held in the grounds of *Brickwood House*, East Croydon. The weather was dull, and the exhibits, being under a tolerably thick canvas, were not seen quite so well as might be desired. The plants (both foliage and flowering) were extremely creditable, and the *Roses*, although not quite so numerous as usual,

were better than had been expected—on the whole, quite up to the usual average.

In the open class for nine stove and greenhouse plants, Mr. W. Hallam, gr. to J. Warren, Esq., *Handcross Park*, Crawley, was 1st. He had two very fine *Ixoras*, 1. *coccinea* and 1. *Williamsii*, several *Ericas*, and two good plants of *Statiche profusa*. Mr. W. Carr, gr. to Mr. Stephenson Clarke, Croydon Lodge, was a very good 2nd, and might well have been awarded an even 1st.

In the class for nine ornamental foliage stove and greenhouse plants, Mr. J. Hallam was again 1st. His *Crotons*, *Palms*, *Asparagus*, and *Alocasia macrorhiza variegata* were of first-rate merit. Mr. W. King, gr. to Philip Crowley, Esq., exhibited very well in this class.

Groups were shown in much variety, and in several classes. The 1st prize in that for a group of plants staged for effect on 100 square feet was gained by Mr. W. King, gr. to P. Crowley, Esq., with a very tastefully-arranged collection, including some good plants of *Odontoglossum vexillarium*.

For a group not exceeding 10 feet by 7 feet, the 1st prize went to Mr. Scott, gr. to J. Aste, Esq., *Ross Road*, South Norwood, the only exhibitor.

In the local class, Mr. W. Wooldridge, gr. to Mrs. Bassett, South Norwood Park, was 1st, for a group covering 7 feet by 6 feet; and W. J. Hart, Esq., was successful in the class for amateurs not employing a regular gardener.

The best *Caladiums* came from Mr. G. Simmonds, gr. to H. C. Mayhew, Esq., South Norwood Hill, and were very well shown.

Mr. Wm. Carr had the best six *Dracenas*, including a good piece of *D. Youngii*, and *D. amabilis*. This was a strong class, and there were several competitors.

Mr. F. Scott showed best in the class for six ornamental foliage stove and greenhouse plants; and Mr. Wm. Carr was 1st for any specimen plant in flower, with a large fine well-flowered plant of *Allamanda Hendersoni*. Mr. W. King had similar honour in the class for one specimen foliage plant, with a large plant of *Anthurium Warocqueanum*.

For six exotic Ferns, the 1st prize was exceedingly well won by Mr. Hallam; he had large plants of *Adiantum cardiophyllum*, *Microlepia hirta cristata*, *Davallia polyantha*, *Nephrolepis davalloides furcans*, and *Davallia Mooreana*; Mr. W. King was a good 2nd.

Begonias were exceptional in quantity and quality. The 1st prize for nine Tuberous *Begonias* was secured by Mr. J. Slater, gr. to Mrs. Hulse, Shepley House, Carshalton, who had first-rate plants, large, and well-flowered.

In the amateur section, Mr. G. Kirk, of Saxon Road, Croydon, was 1st for six plants.

Fuchsias were well shown by Mr. F. Scott, who was 1st for six plants.

In the amateurs' class, for nine Ferns, distinct, Mr. H. G. Frilley, gr. to F. Berau, Esq., Penanroy, Bramley Hill, was 1st, showing small but pretty, well-grown plants.

The best *Gloxinias* were from Mr. E. Perret, gr. to Mrs. Fuller, Duppa's Hill, who was 1st for six; and the 1st place for twelve was taken by Mr. J. Seaton. Mr. C. Simmonds was the exhibitor of the best six zonal *Pelargoniums*; and Mr. Wm. Carr of the best six *Selaginellas*, showing very well in this class, which included several competitors.

Orchids were not much in evidence, but Mr. H. C. Tilbey was awarded 1st prize for six, showing one good plant of *Aërides Lobbi*, and another of *Saccolabium præmorsum*.

Table plants were shown well by Mr. C. Lane, gr. to E. H. Coles, Esq., Burntwood, Caterham, who was 1st for twelve, showing pretty little plants of *Croton*, *Dracena*, *Palm*, *Aralia*, &c.

Mr. W. Carr took 1st for twenty-four varieties of cut flowers.

Table decorations were very fine, and tastefully arranged. The 1st place was taken by Miss C. Cooper, Sydenham Road Nursery, Croydon.

ROSES.

In the nurserymen's class for forty-eight, distinct, Messrs. Paul & Son, the Old Nurseries, Cheshunt, were the only exhibitors; some good blooms, such as *E. Y. Teas*, *Comtesse de Nadaillac*, *Duc d'Orléans*, *Charles Gater*, and *Alfred Colomb*, were amongst them, but there were others that were rather weak. For twenty-four triplets, again, but one exhibitor turned up, although there had been several entries; Mr. Benj. R. Cant, however, had a creditable lot. For twenty-four singles, Mr. Geo.

Mount, *Rose Nurseries*, Canterbury, was 1st, with a very fair collection, including a good *Mrs. Laing*, creditable *A. K. Williams*, *Alfred Colomb*, &c.

Mr. Benjamin R. Cant, was 1st for eighteen Tea or *Noisettes*. A good bloom of *Luciole*, very fresh; *Catherine Mermet*, and some others made a pretty stand. Mr. G. Mount was 2nd.

Mr. G. Mount, with some excellent blooms of *Mrs. J. Laing*, took 1st for twelve blooms of hybrid perpetuals; and Messrs. Prior & Son, Colchester, with *Maréchal Niel*, took the leading place in the corresponding class for Tea or *Noisettes*.

Among amateurs the leading class for thirty-six distinct blooms gave 1st place to Mr. E. B. Lindsell, Barton, Hitchin, but the collection was not nearly so strong as that shown by the same exhibitor at the Crystal Palace on the previous Saturday.

G. Christy, Esq., Buckhurst Lodge (gr., Mr. W. Blundell), was 1st for twenty-four, and staged a good collection, but the blooms were rather small, although even and fresh-looking. Mr. E. B. Lindsell was 2nd, having amongst some very good blooms several very weak ones, which disqualified him for 1st place. In this stand the best Tea shown by an amateur (*Madame de Watteville*) and the best H.P. (*Horace Vernet*) were included, and were awarded Medals.

E. B. Lindsell, Esq., was 1st for six distinct triplets, in this case showing very good large fresh blooms; and also 1st for twelve *Roses*, any variety, with *Comtesse de Nadaillac*.

Ed. Mawley, Esq., Rosebank, Berkhamsted, was 1st for twelve *Roses*, distinct, amongst growers of fewer than 2000 plants; *Alfred Colomb* and *A. K. Williams* were very good in this stand. Also 1st for twelve Tea or *Noisettes*, but the blooms were rather small. Mr. Alfred Slaughter, Steyning, was 1st for four *Roses* in triplets.

Among growers of fewer than 1000 plants, Mr. J. Bateman, *Rose Vale*, Archway Road, was 1st for nine *Roses*, distinct; and C. J. Grahame, Esq., Coombe Road, Croydon, was 2nd. Mr. Moules was 1st for six *Roses*, distinct, from growers of fewer than 500 plants, and had a very creditable lot, especially *Comte de Raimbaud* and *Reynolda Hôte*; and he was also 1st for six Teas or *Noisettes*.

C. J. Grahame, Esq., was 1st in a class for twelve distinct blooms in the local class; his *Mrs. John Laing* in this stand obtained the National Rose Society's Silver Medal for the best H.P., and also that offered by Messrs. John Laing & Son for the best bloom of *Mrs. John Laing*. The winner in this class obtains the Society's Challenge Cup offered to the local amateurs.

Mr. H. Shoemith, gr. to M. Hodgson, Esq., Shirley Cottage, was 1st in the local classes for six *Roses*; and J. De La Mare, Esq., St. Margaret's, Chichester Road, 1st for six Teas or *Noisettes*. Mr. J. Wright, gr. to the Corporation of Croydon, was 1st for six blooms of one variety.

A collection of cut blooms came from Mr. T. Durrant Young, *Roselands Nurseries*, Eastbourne; and from Messrs. J. Peed & Sons, West Norwood, who had a fine lot of *Mrs. John Laing*.

FRUIT.

For three bunches of *White Grapes*, Mr. W. Harvey, gr. to W. Tennant, Esq., was 1st, with ripe *Muscat of Alexandria*; and Mr. C. Blurton gr. to H. Cosmo Bonsor, Esq., Kingswood Warren, Epsom, was 1st, for an equal number of *Black*, showing good bunches of *Black Hamburg*, well-coloured.

Mr. G. W. Cummins, gr. to A. K. Smee, Esq., The Grange, Wullington, had the best *Strawberries*, showing only a fair dish of *Waterloo*.

The 1st prize for a collection of fruit of six dishes was taken by Mr. Wm. Carr, who had large *Stirling Castle Peach*, and good *Black Hamburg Grapes*.

The best *Melon* came from Mr. O. Jeal, gr. to Mr. Waterall, Waddon Lodge. Mr. W. Carr was again 1st for *Cucumbers* with a pair of *Telegraph*.

VEGETABLES.

Mr. C. Parrett obtained 1st for a collection of salads in the local class; and Mr. James Gibson, gr. to Mr. H. Berkeley James, The Oaks, Carshalton, 1st for a collection of vegetables with a very creditable exhibit.

MISCELLANEOUS.

In the large plant tent were a number of groups arranged for effect apart from those in the competitive classes. A group of *Begonias* facing the entrance at one end, was from Messrs. J. Laing & Son, Forest Hill. It was a fine showy collection of the best single and double varieties, with *Ferns* and

Asparagus, and edged with *Caladium argyrites*. But a little way removed was another group from the same firm, composed of *Caladiums*.

Begonias were also shown largely in a group put up by Mr. John R. Box, nurseryman, Croydon. It was very tastefully arranged, and included a good number of *Caladiums* as a relief; many of the varieties were of considerable merit. Mr. Thos. Butcher, South Norwood Nurseries, had a group of miscellaneous plants; and a similar lot, but arranged very differently, came from Mr. C. Chaff, Park Hill Nurseries, Croydon. A large group of plants and Orchids, put up by Messrs. B. S. Williams & Son, Upper Holloway, N., included some good stove plants, and a good piece of *Ada aurantiaca*, but it was not bright enough to show to advantage in so dark a tent.

Messrs. J. Peed & Sons, Roupell Park Nursery, West Norwood, put up a group of plants, including some very well-grown *Caladiums* in good varieties. A collection of bunches of *Violas*, Border Carnations, very fine *Gaillardias*, and sprays of ornamental foliage shrubs, were from Messrs. J. Cheal & Sons. Another collection of *Begonias* were shown by Mr. G. H. Cooper, Sydenham Road Nursery, Croydon.

A group of classes, arranged in a smaller tent, from cottagers, were very satisfactory; the vegetables and salads especially being of rare merit.

TORQUAY ROSE DAYS.

The annual Rose exhibition was held in the nurseries of Messrs. CURTIS, SANDFORD, & CO., of the Devon Roseries, who very kindly placed their large show-house at the disposal of the promoters, the Committee of the Local Gardeners' Relief Fund, besides opening the whole of their houses and grounds free to the public. Valuable prizes were offered by the firm, the Committee on the Relief Fund, and largely supplemented by the Torquay Horticultural Society. The principal prizes for Roses were taken by Mr. J. French, gr. to Moreton Sparks, Esq.; Mr. B. Richards, gr. to R. Mallock, Esq.; Mr. H. Dummerell, gr. to Lady Macgregor; Mr. J. Colwill, Newton Abbott, Mr. J. Stone, gr. to J. Kilson, Esq. Roses were very fair considering the long dry and hot season. The firm of Curtis, Sandford, & Co. staged eighteen boxes of very good blooms in great variety. Miscellaneous groups of plants brought a great many competitors, and very excellent collections were staged, all of great merit. The first prize was awarded to Mr. G. Medland, gr. to Moreton Sparks, Esq., whose group contained a variety of superb Orchids, and very tastefully and skilfully staged. Mr. Sloman, gr. to Captain Tucker, was a capital 2nd. For groups of plants, Orchids excluded, Mr. F. C. Ferris, gr. to J. Kimbe, Esq., was deservedly placed 1st, with a very fine collection. Messrs. Veitch, of Exeter, staged beautiful Carnation Alpines, and other plants in great variety. Mr. Stansford, nurseryman of Torquay, staged a large collection of Carnations of splendid varieties. Messrs. Beach, of Kingswell, staged Carnations, *Begonias*, Roses, &c.

STANMORE HALL, MIDDLESEX.

The residence of W. K. D'Arcy, Esq., is one of the most important in the county, and its gardens since their reconstruction by Mr. Wm. Tidy, the gardener, are well worthy of it. Fruits and flowers are well grown, and in an extensive manner there, the fruits being perhaps of paramount importance. All the fruits under glass have given remarkable crops this year, and still there is abundance to follow. Peaches and Nectarines have been specially fine, the heavy crop of *Alexandra* being cleared. The Early Alfred, which is a great favourite here, is also finished, and each sort in succession is well in hand for keeping up the supply. One trained tree of Early Alfred bore 200 fruits of splendid quality; and among the Nectarines, which have behaved equally well, a tree of *Elruge* bore 150 fruits, which averaged, it is stated, 5 oz. The long ranges of vineries also are in grand condition, and well-cropped; the seemingly endless quantity of Tomatos, both in pots and out, in grand bearing, the best evidently being Stanmore Hall Surprise, raised by Mr. Tidy, and always used for general crop. Among other fruits under glass, the Plums are remarkable, and Blackberry Wilson Jun., which it is intended to grow more extensively, is fine; while in the orangery are some very passable

Oranges, and in one of the stoves the Papaw (*Carica Papaya*) is in fruit.

The large conservatory is brilliant with *Pelargoniums*, *Fuchsias*, *Hymenocallis* (*Pancratium*) *macrostephana*, flowering *Cannas*, *Gladiolus Colvillei* alba, the hybrid *Streptocarpus* of Messrs. Jas. Veitch & Sons, *Taberose*, &c., arranged with Ferns and foliage plants.

In the winter garden, whose lofty pillars are clad with Tea Roses, there is a fine show of bloom, the Carnations, Roses, *Heliotropes*, &c., giving off a delightful fragrance. Here the Cacti bloom profusely, one large plant of *C. speciosissimus* having over fifty fully-expanded flowers, and the lesser specimens of *C. crenatus* being well furnished with their fine cream-white blooms.

In the stove-houses, the large salver-shaped yellow flowers of the *Allamandas* and the white of the *Stephanotis*, together with the mauve-coloured panicles of the *Bougainvillea glabra*, all of which are trained to the roof, form a fine sight; and on the staging are *Dracenas*, *Crotons*, *Anthuriums*, &c., for indoor decoration, which is a branch of the gardener's art to which much attention has to be given here. In the other houses specially noteworthy are a fine batch of *Calanthes*, a grand lot of *Gloxinias*, some fine plants of the scarlet *Scutellaria Mocciniana*, a sturdy lot of *Kalosanthes* in bud, a good selection of *Begonias*, and, generally speaking, nice batches of most plants useful for cutting or for decoration.

From the terrace in front of the mansion, which stands on high ground, a grand view is obtained, the richly-coloured flowers in the geometrical garden, and the many fine beds of Roses and other flowers just beneath the eye, appearing the more brilliant in contrast with the green and more sober hues of the surrounding scenes, and the grey of the distant horizon. Near the mansion are three fine examples of Copper and Purple Beeches, some fine Conifers and other trees, and a quantity of judiciously-planted *Rhododendrons*, which have made a great display. The lawns and kitchen garden have suffered much from drought, the Pea crops being much affected. Nevertheless, two kinds, which are great favourites here, viz., Veitch's Earliest of All and Duke of Albany have been remarkably good, the latter still having a fine crop. These two varieties of Peas have withstood the drought better than any of the others, and seem to have been unaffected by it.

THE ROSERY.

AMERICAN ROSES.

A GREAT deal of "high faluting" has been written by the Americans concerning the contributions which they have made to our Rose gardens, and as in these days people are taken very much at their own estimate, a much higher position has been accorded to them in this respect than I think they have merited. Indeed, what we have received from thence has been almost altogether in the way of sports, and not seedling varieties. It may therefore be useful to notice those varieties which we have received from them, and to show what is the position they are entitled to occupy:—

Marshal P. Wilder.—We received glowing descriptions of its beauty, brilliancy of its colouring, habit, &c., but when it was grown here, it turned out to be so like Alfred Colomb, that when brought before the National Rose Society's Catalogue Committee, it was bracketed with that flower, and in their recent catalogue it disappeared altogether. Sometimes in the case of too-much-alike Roses, there is a certain dissimilarity in the foliage and style of growth which induces people to continue to grow them, notwithstanding the similarity of bloom. But every one knows the distinct character of the growth of Alfred Colomb, it being so upright, and the flower with its long footstalk being thrown considerably above the foliage. This is precisely what Marshal P. Wilder does.

American Beauty.—This came out with a great

flourish of trumpets, and we all expected to have got something valuable; but, alas! it was only a "wooden nutmeg," and very soon our experienced rosarians detected in it an old and worthless variety, Madame Ferdinand Jamain. It remained for a little while in our catalogues, but is now being gradually eliminated from them.

The Bride.—This is without doubt the most valuable Rose we have received from America. It was sent out in 1885, and immediately assumed the place it has ever since maintained; it is not a seedling, but a sport from that long-established favourite, Catherine Mermet, which was raised by Guillot in 1869. It is of precisely the same character as the flower from which it has sprung, and has frequently been exhibited with an equal number of Catherine Mermet in the stand—a stand which is much admired. It is very fixed, and I have never known an instance of its falling back to the original.

Sunset.—A sport from *Perle des Jardin*, combining all the excellencies and defects of that flower, but of a rich tawny orange colour; like its parent, it is very difficult to open in wet weather, and sometimes comes with a cleft centre. Such a season as that we are having now suits it admirably, and its bright flowers, somewhat of the colour of Madame Falcot, are very attractive.

The Puritan.—A good deal of excitement was occasioned some years ago by the reception of a stand of this flower, which had been packed and sent in an ice-chamber from America, and which arrived perfectly fresh; but the flower is valueless for us. It is white, confused in shape, with a number of small petals, and very full, making it almost hopeless to open in wet weather.

Waban.—This is another and more recent sport from Catherine Mermet; the colour is deep salmon-rose, retaining all the good form and build of the type; it has not, as yet, been much exhibited here, but doubtless we shall see a good deal of it this season.

The Queen.—This, which is another sport obtained by Messrs. Dingee and Conard, of West Pennsylvania, appears to have been fixed about the same time as *Souvenir de S. A. Prince*, both being sports from *Souvenir d'un Ami*, but of course preference was given by English rosarians to their home Rose, and consequently the American sport has almost gone out of cultivation over here. Besides these there are several of more recent origin of which I know nothing, but of which Mr. Geo. Paul writes:—"Beside these are Bridesmaid, a beautiful pink sport from Catherine Mermet; Oakwood, a pink H.P.; J. B. Hayes, Bourbon climbing La France, received this year; climbing *Perle des Jardin*, a really climbing form; Golden Gate, a Tea in the way of *Souvenir d'Elise*; Pearl Rivers, a tinted white China; Ruby Gold is Jean Ducher (but Ketten of Luxembourg says that it is another sport from Catherine Mermet); Rainbow, a striped rosy China, is distinct; H. M. Stanley, no good; Pink Pearl we have not seen." As far as I know, these are all the Roses we have received from America, and, excluding those of a later date mentioned by Mr. Geo. Paul, I think we might send them all back, except *The Bride*, and our Rose gardens be none the poorer. Consequently, the notion which seems to have seized some people's minds that we are much indebted to our American cousins, has little foundation. There does not seem to be any person who systematically hybridises and saves seed, as do some of the growers in our own country. *Wild Rose*.

ROSA RUGOSA.

It is a pleasure to find that such beautiful Roses as *R. rugosa* and its forms are shown in bunches at the exhibitions, a feature that secretaries would be wise to encourage. The classes for the single and old-fashioned types are a source of much interest to visitors, who do not, as a rule, know the merits of prize hybrid perpetual or tea-scented blooms. *R. rugosa*, the Japanese species, is a splendid garden shrub—for such we may call it. The growth is spreading, dense, and the leaves of a polished green

colour. When the soil is deep, the branches will grow over 4 feet in height, and the large, single, fragrant, rosy-purple flowers are produced until quite the autumn, the crimson fruits adding rich colour towards winter. It makes a good hedge, and is grown thus in Mr. G. F. Wilson's charming garden at Wisley, forming a good barrier to cattle, and gay with flowers and fruits through a large portion of the year. The variety alba is a lovely Rose, the flowers similar to those of the species, but of the purest white. There is also a double crimson and a kind named Madame Georges Bruant, which has large, double, paper-white flowers—a distinct and interesting hybrid. *R. rugosa*, raised from seed, varies in colour, and we may anticipate in the future many more hybrids of fine character. Comte d'Eprenail is a form of this class, the flowers semi-double, purplish in colour, and very sweet-scented. It is one of the most fragrant Roses in cultivation. A large bush of *R. rugosa* on the lawn is very handsome, and it is adapted for grouping. *I.*

GARDENERS AND GARDENING ON THE RIVIERA.

GARDENING on the Riviera is very different to our English style of gardening; and to a man arriving from the north, everything seems different, and, broadly speaking, he has to commence gardening afresh, or to more closely define it, he has to proceed very cautiously until he knows the climate and the different seasons.

The French *Jardiniers en chef*, as we will term them, are generally ordinary labourers who, through having spent most of their life in gardens, have risen to the honourable post of head gardener.

They know the climate; they can produce a good supply of the ordinary flowers of the Riviera; they can tell a *Phoenix canariensis* from a *Washingtonia lifera*; and they will do almost anything that is required of them in the way of manual labour, from the using of a spade, to standing a whole hour bare-headed in a snow-storm whilst talking to you (more polite than prudent on their part).

As in England, a man that can use a spade and shovel, and works in a garden, is called a gardener. These men are cheap, and suit the purpose of the majority of proprietors; but if the true definition of the word gardener were known, I am afraid they would fail to be classed under that heading. There are, no doubt, some French gardeners to be found that will hold their own with any of the leading men of the day, and these men, as a rule, occupy first-class places.

Where an Englishman is to be found, you almost invariably find a good garden, well kept, and in every way presentable.

Kew men are well to the front, as the training they get whilst at Kew (both in the nomenclature and cultivation of plants) serves them well out here, as the plants which are generally to be met with in these gardens are nearly all to be found at Kew; and whilst working in the various departments, one gets a good knowledge of them.

One example will be sufficient to prove my statement. In one of the finest and most noted gardens on the Riviera, with which I am well acquainted, the gardener (who, by the way, was a Frenchman, and, to boot, a very clever man) planted many rare things which do well here during the summer, but which require thin protection from the slight frosts we get occasionally during the winter.

In his time they grew and flourished under his careful and skilful culture, but the man who succeeded him was not a *connoisseur des plantes*. One after another was killed, and found its way to the rubbish-heap without the slightest ceremony; and, in this way, many valuable plants, that once added greatly to its reputation, have returned to the dust from whence they came. Unlike the north, we have no good works or periodicals treating on the culture

of plants in this climate, and, therefore, a man coming out with a good knowledge of plants, has an advantage to commence with.

With so many valuable plants under our charge, our anxiety is further increased by the possibility of heavy losses, which we often experience amongst our batches of annual plants, which are so much used for bedding-purposes. For example, a man may have a fine healthy batch of Carnations at the present time, but before the winter he may lose more than fifty per cent. of them.

Again, last season the Pansies were attacked by a disease, and some gardeners lost almost the whole of their stock by it. The cause of so many diseases is obvious, if we take into consideration the nature of our soil. It consists chiefly of sandstone and limestone, which, in a crude state, is solid rock, which has to be broken to pieces, and often in the first place blown out with gunpowder, and after being exposed to the air and moisture, it crumbles up and forms the soil of our gardens.

Now, it is evident that this soil does not contain sufficient ingredients for the welfare of the generality of plants, especially annuals, and if the material is not supplied in the way of manure, &c., and in sufficient quantity, the plants must naturally suffer. Again, the diseases—if such they may be termed—are not of a lingering nature, for a batch of plants may be in good health one week and dead the next.

Many instances of this kind are to be noted during the hottest part of the year, which again, as far as I have observed, is caused by the excessive heat of the sun. It is natural that the greater the heat, so much greater must be the respiration and assimilation; and, if the necessary ingredients are not supplied to compensate the loss, the plants must naturally suffer.

Again, it must not be overlooked that evaporation from the soil goes on much faster under the influence of the scorching sun, and the soil, being of a very porous nature, gives it off more freely. There are many little points which might be of interest to readers, of the success or failure in the cultivation of many plants, which, in England, are of little or no trouble to grow; but, in the face of all odds, I must admit that good gardening on the Riviera is much more difficult than in England, but *malheurusement* proprietors cannot as yet be convinced of the fact. *Riviera.*

TRADE NOTICE.

We learn that Mr. R. S. Baxter, for many years foreman of the Botanic Garden, Oxford, son and grandson of former distinguished Curators of the garden, has taken the Marston Street Nursery at Oxford. Mr. Baxter's extensive knowledge of plants and their culture should stand him in good stead in his new venture.

ENQUIRIES.

"He that questioneth much shall learn much."—BACON.

LEOPARD AND HARVEST LILIES.—Have any of your readers heard the term Leopard Lily given to any other plant than the genus *Lachenalia*? and is there such a plant as the Harvest Lily? *E., Cardiff.*

Obituary.

JOSEPH THEOBALD, for the past thirty years florists' foreman to Messrs. George Bunyard & Co., Maidstone, passed away on June 29, after a few days' illness. He was a quiet, and much respected man, and was formerly with Mr. Ben Cant, of Colchester, where he propagated that queen of Tea Roses, Souvenir d'Elise.

(By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.)

The districts indicated by number in the first column are the following:—

- 0, Scotland, N. Principal Wheat-producing Districts—
- 1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S.
- Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; * Channel Islands.

THE PAST WEEK.

The following summary record of the weather for the week ending July 1, is furnished from the Meteorological Office:—

"The weather continued unsettled, and showery in all districts during the earlier part of the period, with thunder and lightning in several localities. Subsequently, however, the conditions became fine and dry again in all districts, and continued so for the remainder of the week.

"The temperature equalled the mean in 'Scotland, E.' and 'Ireland, S.' but was slightly above it in all other districts. The highest of the maxima, which occurred at most stations on July 1, varied from 86° in the Midland Counties, to 85° in the 'Channel Islands,' and 84° in 'England S. and S.W.,' to 74° in 'Ireland, S.' The lowest of the minima were recorded, as a rule, during the earlier days of the period, and ranged from 55° in 'Scotland, W.,' and 39° in 'Ireland, N.,' to 44° in 'England, N.E.,' and to 49° in the 'Channel Islands.'

"The rainfall was rather more than the mean in 'Scotland, E.,' 'England, N.W.,' and over Ireland, and just equal to it in 'England, S.W.,' and the 'Channel Islands;' in all other districts, however, there was again a deficit. In some parts of Ireland the rain was very heavy locally—that on Tuesday at Danganon the large amount of 3.33 inches was recorded between 12.30 and 7 P.M.

"The bright sunshine was rather less than the normal in Scotland, but exceeded it over England and Ireland. The percentage of the possible duration ranged from 53 in the Channel Islands, and from between 43 and 48 in most parts of England, to 31 in 'Scotland, W.,' and 25 in 'Scotland, N.'"

CHISWICK GARDEN FLOWER SHOW.—On Tuesday, July 11, the Committees of the Royal Horticultural Society will meet in the Gardens at Chiswick, which we may remind our readers are near to Acton Green, Turnham Green, Gunnersbury, Chiswick and Kew Bridge Stations. A special show of Carnations and Picotees, by the National Carnation and Picotee Society will be held in conjunction with the Society's meeting. The Fruit, Floral, and Orchid Committees will meet at 11 A.M., and Lady GEORGE HAMILTON has kindly consented to distribute the prizes in the afternoon. The Band of the Royal Horse Guards, under the direction of Mr. CHARLES GODFREY, will perform during the day, and the exhibition will be open to the public from one to eight P.M. Fellows of the Society and special subscribers will be admitted to the gardens at noon. Intending exhibitors should not fail to communicate the nature of their exhibits to Mr. BARRON forthwith, so that the required amount of space may be allotted.

CARNATION DUCHESS OF YORK.—We have received from Mr. GIFFORD, Montague Nurseries, Tottenham, some fine blooms cut from plants growing in the open ground of the above variety. In colour it is just that of the Souvenir de la Malmaison Rose, with the centre a tender pink, as in that Rose. It is a fairly full flower, with florets simply arranged, not confused, as in the Carnation of that name, and fragrant. A desirable addition to border Carnations.

MARKETS.

COVENT GARDEN, July 6.

MARKET dull to-day in consequence of the Royal Wedding, but a brisk business during the week, with heavy supplies at prices somewhat easier. James Webber, Wholesale Apple Market.

SEEDS.

LONDON, July 5.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., write that

as was expected, this morning's seed market presented quite a holiday appearance, with but little business passing. For their new Trifolium, the French are asking long prices; a few good-sized parcels of home-grown seed have been sent to market. There is no change in either Mustard or Rapeseed. Canary seed, as is always the case at the turn of the half-year, is dull of sale, but meantime, values show great strength. Linseed is rather dearer. Hemp-seed keeps firm. For Peas and Haricots full prices are made.

FRUITS AND VEGETABLES.

BOROUGH: July 4.—Quotations:—Peas, 2s. to 3s. 6d. per bushel; Cabbages, 4s. to 6s. per tally; Parsley, 3s. per dozen bunches; Egyptian Onions, 4s. 6d. to 5s. per cwt.; Horseradish, 2s. 6d. to 2s. 9d. per bundle; Cherries, 4s. to 6s.; Gooseberries, 1s. 6d. to 3s. per half-sieve.

FARRINGTON: July 6.—Quotations:—Apples, 4s. per bushel; 1s. 9d. per basket; Green Gages, 2s. to 2s. 6d. per flat; Cherries, 4s. per bushel; Currants, White, 2s. per 15lb.; do., Black, 2s. 6d. per 24 lb.; do., Red, 3s. per 24 lb.; Raspberries, 3d. per pound; Gooseberries, 1s. 6d. to 2s. per half-bushel of 24 lb.; Tomatos, 5d. per pound; Grapes, 10d. per pound; Cucumbers, 3s. per dozen; Peas, 2s. 6d. to 3s. 6d. per bushel; Cabbages, 4s. to 6s. per tally; Onions, Egyptian, 4s. 6d. to 5s. per cwt.; Turnips, 2s. 6d. to 3s. 6d. do.; Carrots, 1s. 6d. per dozen bunches.

SPITALFIELDS: July 4.—Quotations:—Cabbages, 4s. to 6s. per tally; Peas, 2s. to 3s. 6d. per bushel; Turnips, 2s. 6d. to 3s. 6d.; Egyptian Onions, 4s. 6d. to 5s. 6d. per cwt.; Horseradish, 2s. 6d. to 2s. 9d. per bundle; Cherries, 4s. to 6s.; Gooseberries, 1s. 6d. to 3s. per half-sieve.

STATIONERS: July 5.—There was an excellent supply of all kinds of produce at this market during the past week, and a brisk trade has been done as under:—Cabbages, 2s. 6d. to 5s. per tally; Cauliflowers, 9d. to 1s. 6d. per dozen; do., 3s. 6d. to 7s. per tally; Mangels, 2s. to 2s. 8s. per ton; Onions, Egyptian, 80s. to 100s. do.; Apples, English, 3s. to 4s. 6d. per bushel; Black Currants, 3s. to 4s. 6d. per half-sieve; Gooseberries, 1s. 6d. to 2s. 6d. do.; Plums, 2s. to 3s. 2d.; Pears, 2s. to 2s. 6d. Vegetables: Marrows, 1s. to 2s.; Horseradish, 2s. 3d. to 2s. 6d. per bundle.

HAY.

Averages.—The following are the averages of the prices at the various metropolitan markets during the past week:—Clover, prime, 140s. to 165s.; do., new, 115s. to 130s.; do., inferior, 100s. to 120s.; hay, best, 145s. to 165s.; do., inferior, 90s. to 100s.; new mixture, 115s. to 130s.; and straw, 42s. to 50s. per load.

NOTICES TO CORRESPONDENTS.

BOOKS: *Beginner, Hensfrey's Elementary Course of Botany; Moore's Handbook of British Ferns.*

DATES OF SHOWS: *T. O. C.* The dates of horticultural shows of importance are given in these columns from week to week, but not agricultural shows; for those you should apply to the agricultural journals.

GRAPES DISEASED: *B. W. A.* The berries are affected with the so-called spot, a fungus—*Glaeosporium laticolor*. Cut out and burn the berries which show the least trace of spotting. Let the air of the vinery be warm, buoyant, and always in motion, the reverse of cool, moist, stagnant—conditions that favour the growth of the fungus. Keep the flowers-of-sulphur mixed like mustard about the vinery in saucers. Coat the hot-water-pipes with lime and sulphur wash, and use them when there is need to do so.

GRAPES SHRIVELLING: *J. R. R.* Without knowing more about the state and treatment of the Vines than your note affords, and seeing the produce, &c., we cannot tell you why the berries shrivel. Kindly send specimens of the best and worst bunches, shoots, leaves, &c. The gardener certainly should not keep the borders covered with manure and straw at this season. The roots of Vines need heat as much as the top growth, and masses of manure, &c., hinder the heat penetrating the soil.

GRAPES THAT HAVE LOST THEIR BLOOM: *One in Distress.* We should suppose, now that you have washed the bloom off the fruit by inordinate syringing, you might restore it after the manner of the ladies, by means of violet powder and a puff! This is the only advice we can afford you.

HOTELS FOR GARDENERS VISITING LONDON: *H. C.* We cannot recommend particular establishments, but we would advise *H. C.* to patronise the larger hotels in preference to the smaller ones and coffee-houses. They are cleaner, the service and cooking are better, and the prices are not extravagant.

INSECTS: *R. S. B.* The Longicorn Beetle is *Diaxenes* sp., which seems to have been imported with some plants lately. If it breeds here it will prove

troublesome. The only remedy we can suggest is to catch and destroy. If you have more specimens, please send some.

MANGEL WURZEL OF LAST YEAR: *A. P.* If the roots are still sound, and the tops can grow a little, the stacks being ventilated at the apex in the usual way, there is no reason why they should not be used as cattle food during late autumn and early winter. They will lose in nutritive qualities if their juices have to support new top-growth, and we think that unless growth is made, withering, and eventually decay, will occur very soon.

NAMES OF PLANTS: *J. W.* Tall one, *Armeria vulgaris*; dwarf, *A. maritima*.—*Buckley*, *Camassia Fraseri*, a native of United States of America. *G. H. S.* *Vaccinium arboreum*.—*Hugo M.* *Campanula lactiflora*, fine specimen; more than usually glabrous.—*R. R.* 1, *Lysimachia verticillata*; 3, *Erinus alpinus*; 6, *Anchusa officinalis*.—*C. W. D.* *Campanula lactiflora*.—*Dorset*. 1, *Leycesteria formosa*; 2, *Escallonia rubra*.—*A. Clark*. We cannot name the Rose; 2, *Spiræa arifolia*.—*R. O.* A species of *Malpighia*, of which several were or are in cultivation. We will endeavour to give you the specific name next week. In the meantime, we do not think it would be a good commercial plant, but of that you ought to be a better judge than we.—*J. W.* A species of *Fraxinus* or *Ash*, we will endeavour to give you the specific name next week.—*B. H. & Son*, *Rhyncostylis (Saccobolium) guttata*; *Adiantum Waltoni*; *Hedera Helix digitata*.—*Monmouth*, *Oncidium Lanceanum*.—*C. E. H.* 1, *Tanacetum vulgare*; 2, *Sidalcea malviflora*; 3, *Malva moschata alba*; 4, *Lieracium aurantiacum*; 5, *Hesperis matronalis*, double-flowered; 6, *Reseda lutea*.—*A. H. S.*, *R. H. S.*, *E. D. L.*, *J. T. L.*, all next week.—*L. M. C. S.* Both seedlings of *Kentia Forsteriana*.—*A. H. P.* *Pelargonium ignescens*.

OPEN-AIR TOMATOS: *F. N., Evesham*. You will find full instructions for preparing the Bordeaux Mixture on p. 12 of our last issue. Do not wait till the disease appears on the plants before making use of the remedy, but do not use it if the fruits are near to ripeness.

ROSES: *A. C.* We cannot undertake to name Roses. Send them to a nurseryman who grows Roses largely.

VINE, MELON, AND TOMATO: *J. Shepherd*. I see nothing but a sickly, emaciated appearance, like rapid decline. There is no fungus. It is wholly indeed a question of culture, and I cannot say what. It is not a fungus attacking indiscriminately Vines, Melons, and Tomatos; besides, there is no trace of fungus, there must be some local cause not to be guessed from the plants. They have no vigour in them, but I find no spots, and nothing to suggest fungus disease; they are simply miserable rickety children, being "coddled to death." *M. C. Cooke*.

VINES: *Subscriber*. I find no fungus disease at all. I think the mischief must be at the roots. *A priori*, the fact that several other Vines are in the same house, and doing well, is against fungus disease, and points to something exclusively belonging to this Vine. The brown spots on the edges of the leaves are peculiar; you will see how they retreat inwards in concentric waves in a way no fungus spots are formed, and there is no mycelium. The general character of the leaves and branches is that of healthy tissue, but checked suddenly. The Grapes are so small, too, and in rotting are covered with a white bloom. Within the berry I have not found a thread of mycelium. It is no fungus there. Outside the white bloom is a very small mould, but a saprophyte, a minute *Penicillium*, quite innocent of any mischief, and follows on the rotting berries. *M. C. Cooke*. [The setting, from some cause or other seems to have been imperfect. Ed.]

ESTATE SALES.

The Best County Medium for Advertising Sales of Estates in

THE "WORCESTER HERALD,"

ESTABLISHED 1794,

The Leading County Paper. Extensive circulation among the upper and middle classes in Worcestershire and adjoining counties. Advertisers would do well to forward for reference and distribution plans and particulars of Estates, Catalogues of Machinery, Furniture, Books, and other property advertised in the columns of the "HERALD."

Sale of Stock and Agricultural Effects.

The "WORCESTER HERALD" is the most effective organ for giving publicity to announcements of this class. It is the leading Agricultural Paper in the County, and Circulates most extensively among Agriculturists in and around Worcestershire.

Farms to Let.

Land Agents, Estate Managers, and all having Farms to Let, would do well to advertise in the "WORCESTER HERALD," the leading County Paper. Specially adapted for bringing such notices before Tenant Farmers. Large circulation, Moderate charge.

Situations Vacant and Wanted.

For producing results the "WORCESTER HERALD" is recognised as a specially good medium. Cheap Rates.

THE IMPROVED GARDEN GULLY (VINCE'S PATENT).

This useful invention is a great improvement on the ordinary Garden Grating, and is especially suitable for lully walks and drives. As they never get stopped by rubbish or sand they effectually prevent the washing away of the gravel in heavy storms, and they save half the labour in cleaning out the cesspools. The prices are:—
6-in., 1s. 6d.; 8-in., 2s.; 10-in., 3s.; 12-in., 6s. 6d. 15-in., 8s.
(The larger sizes are very strong for carriage drives.)
Full Particulars and Testimonials on application.

GARDENING APPOINTMENTS.

MR. A. MUNRO, late Foreman with W. F. RUSSELL, Bensham Nursery, as Head Gardener to WALTER WILSON, Esq., Mayor of Gateshead, Enfield, Durham.

MR. G. TURNER, for the last eight years Gardener at the Green Hills, Tilford, Surrey, as Gardener to L. WALTERS, Esq., Woodhays, Wimbledon, Surrey.

MR. GEO. ROBERTS, as Orchid Grower to R. B. WHITE, Esq., Ardarauch, Gariochhead, Dumbartonshire.

MR. J. PAGE, late Foreman at Hackwood Park Gardens, as Gardener to T. RIX PERKINS, Esq., Greenford Green, Harrow, Middlesex.

MR. JOHN GARLETT, formerly of Hale Park, Salisbury, and Holwood, Bromley, Kent, as Wood Manager to Lord WIMBORNE, Canford Manor, Wimborne.

WANTED, a WORKING HEAD GARDENER, Church of England. State age, family, wages, qualifications, service. Personal character required.—Mrs. ROE, Kendall Hall, Elstree, Herts.

WANTED, a WORKING FOREMAN, in a Private Place, about 20 miles from London, where half-a-dozen hands are kept. Must be a single man, of great experience, well up in his business, both as to Fruit, Flowers, and Vegetables; civil and obliging, and competent to take charge of establishment if needed.—Reply, stating age, wages expected (lodgings will be found), with all other particulars, by letter only to T. J. M., Messrs. D. Gosden & Co., 17, Tavistock Street, Covent Garden, W.C.

WANTED, a FOREMAN, in a large Market Nursery, well up in Carnations, Roses, Ferns, Heaths and General Stuff. Must have had plenty of experience in first-class London Market Nurseries.—Apply by letter only, stating references, to J. COOPER, Avenue Nursery, Bexley Heath, Kent.

WANTED, a GERMAN PROPAGATOR and GENERAL FOREMAN, with Market-work experience, for a good permanent situation in a large place in Belgium. May be married.—Write stating wages required, and most accurately, former situations occupied, to H. V. P., *Gardeners' Chronicle* Office, 41, Wellington St., Strand, W.C.

WANTED, a strong active MAN, as SECOND.—Age 23; accustomed to Fruit and Plants. Wages 20s. No boy. State experience to J. JONES, The Gardens, Terrace House, Southampton.

WANTED, a GOOD HAND for BUDDING Fruit Tree Stocks by the thousand.—W. HORNE, Perry Hill, Chiff, near Rochester.

WANTED, August 1, a good COUNTER HAND. Wages to commence at 21s. per week.—Apply, by letter, with full particulars, to F., 13, King Street, Covent Garden, London, W.C.

WANTED AT ONCE, for Branch Business in Cheltenham, an experienced ASSISTANT for Florist's Shop, able to arrange tastefully.—Apply, stating full particulars and wages required, to H. ENGLISH, Nurseryman, Clevedon.

WANTED, a young Man, as INDOOR SERVANT, and attend to small Garden. Good testimonials essential; 7s., all found.—Apply by letter, T. GRIF-FITHS, 1, The Cedars, Clapham Common, S.W.

WANT PLACES.**TO GARDENERS AND OTHERS SEEKING SITUATIONS.**

Advertisers are cautioned against having letters addressed to initials at Post-offices, as all letters so addressed are opened by the authorities and returned to the sender.

The pressure upon our space at this season of the year is so great, we are compelled to state that advertisements received after 6 P.M. on Wednesday will, in all probability, be held over to the next week.

RICHARD SMITH AND CO.

beg to announce that they are constantly receiving applications from Gardeners seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

TO GARDENERS, &c.—Lad, nearly 17, strong and willing, desires a situation in a Garden or Nursery, Inside or Out. No experience.—E. A., Mr. Staines, Ringwood, near Dover.

TO GARDENERS.—Situation wanted by a Gardener's son, Inside or Inside and Out; age 19; two years' good character. Total abstainer; leaving through a death.—H. GARDNER, Ropley, Alresford, Hants.

PAINTER, GLAZIER, &c., wants Employment.—Handy at Repairs; used to Nursery and Gardeners' Glass-houses. Any district. Small job undertaken.—GREEN, 3, Sunnyside, Birkbeck Road, Sidcup, Kent.

TO NURSERYMEN.—Wanted, by a young Man (age 22), total abstainer, a situation in a Market Nursery, next to Foreman. Understands his Work. Good character and references.—Apply, stating wages, &c., to A. B., 5, Russell Road, Lea Bridge Road, Leyton, Essex.

COLLECTOR of RENTS in the Country.—Age 33 years; fourteen years' character. Highest references; security if necessary.—X. O., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

TWINE SWEET CLUSTERS of ORANGE BLOSSOMS into a fitting garland for the Bride of our Sailor Prince, and pray that she may be endowed with health and happiness. These are twin blessings, for one cannot be enjoyed without the other and many a loyal English heart will pray during the ensuing week that they may be showered upon the Royal couple. Thinking in this strain reminds us that Holloway's Pills and Ointment have done more in eradicating disease throughout the world than any other medicine. During the sultry, depressing weather, common at this season, they are invaluable, as they speedily cure Diarrhoea, Dysentery, and all disorders of the Stomach and Liver. They may be obtained from all Chemists and Medicine Vendors.

MESSENGER & CO'S New CATALOGUE of Greenhouses and Heating Apparatus,

Just issued, will be found the most complete, practical, and reliable guide to all about to build, alter, or heat Greenhouses. Illustrations of every description of Glass-house, from the largest range of Winter Gardens to the simplest forms of Portable Greenhouses, Plant Protectors, and Garden Frames; also of all the best kind of Boilers, Hot-water Pipes, and all appliances for heating. This Catalogue, possessing hundreds of illustrations of all the latest improvements in greenhouse building and heating, is on a scale never before attempted. It should be in the hands of every one interested in gardening, as it contains many practical hints on the subjects of which it treats, the result of many years' experience. Price, 2s. post-free.
A large number of the illustrations are taken from greenhouses erected by us in various parts of the country; an inspection of this Catalogue shows, therefore, buildings the efficiency of which has been well tested by actual use. The advantages possessed by us enable us to carry out work with the utmost promptness, and in the very best style, at prices which defy competition. Surveys made, and gentlemen waited on in any part of the country. Plans and Estimates free on application.

"GARDENERS' CHRONICLE."

LARGELY INCREASED CIRCULATION.

IMPORTANT TO ADVERTISERS.—The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper, increased to the extent of 75 per cent.

Advertisers are reminded that the "Chronicle" circulates among COUNTRY GENTLEMEN AND ALL CLASSES OF GARDENERS AND GARDEN-LOVERS at home and abroad, and is preserved for reference in all the principal Libraries.

ADVERTISERS will greatly assist our efforts to get to Press earlier, by forwarding their favours as EARLY IN THE WEEK as possible.

STRAWBERRY PLANTS.—During the drought we were favoured with 3 inches of rain, consequently our plants are green, and growing almost as fine as usual. Catalogue, post free, of all the best kinds. New varieties are very strong. Special prices for large quantities. Col. BROCKMAN, Dodsley, Midhurst, says:—"The Strawberries supplied by you are giving splendid results."
H. CANNELL AND SONS, Swanley, Kent.

20,000 PTERIS CRISTATA, extra good form, fine stuff, in thumbs, fit for potting into 45's.
12s. per hundred, or £5 per thousand.
Not less than Fifty sent at the above price.
Other sorts of Ferns on application.
J. HILL, Florist, Lower Edmonton.

For Present Sowing.

SUTTON'S FLOWER OF SPRING CABBAGE
—The best Cabbage for Autumn Sowing. Comes very early in spring, produces finer heads than other autumn-sown Cabbages, and shows no disposition to run to seed. W. H. Gamble, Esq., Great Yarmouth, says:—"Your Flower of Spring became a Cabbage when other varieties were little better than greens."
Price of Seed, 1s. per ounce, post-free.

Elm, Cambridgeshire.

VALUABLE ORCHARD LAND FOR SALE.

MESSRS. MAXEY AND SON have received instructions to SELL by AUCTION, at the "White Hart" Hotel, in Wisbech, on THURSDAY, August 3, 1893, at 7 o'Clock in the evening precisely, a very valuable ORCHARD and FRUIT GARDEN, situate in the village of Elm, about 2 miles from the Market Town of Wisbech, and in the midst of one of the finest fruit-growing districts in that neighbourhood. The property comprises in all 2 1/2 a. 0 r. 36 p. of extremely valuable land (the soil being of the richest quality, and especially adapted for the cultivation of Strawberries), together with a commodious brick and thatched Farmhouse, with large Barn, Granary, Stables, and other outbuildings. Possession will be given at Michaelmas next.

Particulars, Plans, and Conditions of Sale can be obtained on application to the Auctioneers, South Brink Place, Wisbech; or to BOTSFORD AND KING, Solicitors, 10, Market Street, Wisbech.

RENT FREE COTTAGE and 4 Large New GREENHOUSES, well Heated with Hot-water Pipes, all in good condition, Stock only £28, worth double. ALSO, FLORIST and SEED BUSINESS, Stock at valuation. Both 10 miles from London, near Station and Post-office. G. L. 41, Wellington Street, Strand, W.C.

City of Peterborough.

TO BE LET, with Immediate or Michaelmas Possession, the well-known, old-established Peterborough BUSINESS, comprising a NURSERY FARM of 25 acres, of which 13 acres are under cultivation, not heavily stocked; the remainder in Pasture Land, with good House and Premises, Greenhouse, Pits, &c., adjoining the Town. Also, a superior SEED SHOP and STORE, in a first-class central position; and a FLOWER-STAND on the Great Northern Railway Station. The whole Business has for many years been carried on by Mr. John House, who is retiring on account of declining health, and leaving a fine opportunity for an enterprising tradesman.

Apply, FOX AND VERGETTE, Estate Agents, Peterborough.

TO BE SOLD, a NURSERY, containing 10 Houses, all Heated and well Stocked, at a Ground Rent of £10 per annum.—W. J., Silver Hall Nursery, Isleworth.

FOR SALE, LEASE of a capital NURSERY, FLORIST, SEED, and JOBBING BUSINESS, 9 miles from Covent Garden. Long lease. Low rent. Good connection. £100 stock alone worth more. Part could remain. DAVALLIA, 41, Wellington Street, W.C.

FOR DISPOSAL, Genuine Old-established SEED BUSINESS; situate in main thoroughfare of one of the best Market Towns in the Midlands. Present Turnover about £800. Splendid opportunity for young Man starting Business. Total income from £150 to £300. No Book Debts to take to. Satisfactory reasons for Disposal.—S. S., Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.

Island of Jersey.

Renowned for its Warm Climate and Early Produce. TO BE SOLD, as a Going Concern, GENTLEMAN'S RESIDENCE, Farm House and Buildings, Gardeners' Cottages, about 20 acres of rich soil, two Vineries, numerous Glasshouses (spans and lean-to's), Forcing-houses, Pits with Hot-water Pipes, good Well of Water, with H.P. Engine, Beltiog, Shafting, &c., complete for pumping water, together with the VALUABLE STOCK of Bulbs, Ferns, Roses, Carnations, Lilies, Stephanotis, Tomatos, Potatos, &c.; two Horses, Van, Carts, Harness, and Implements of Trade. Lease five years; rent only £150 per annum; no rates and taxes. Price for Stock, Lease, &c., £1,250. No law costs. The Potato crop on the land alone realised £300 this year. The above offers to an energetic man an exceptional chance of acquiring a small fortune in a few years. Address, G. S. HENGINSTURY, Brentford, London, W. Photos can be seen.

FLORIST and SEEDSMAN, in prominent Position in the City; established six years. Fifteen years' Lease; good connection; Cash Trade. £150, or reasonable Offer. Thoroughly good-paying Business; would suit Lady or Young Man. B. L. EAGLES, Philpot Lane, London, E.C.

FOR SALE.—Capital NURSERY, situated in main thoroughfare, three minutes from Station, and 5 miles from Covent Garden, containing about 200 feet-run of Glass, heated by hot water; and about 1 1/2 Acres of Land, well stocked, and in working order. Low Rent. Price as it stands, £175.—W., 41, Wellington Street, Strand, W.C.

TO NURSERYMEN.—Lease and Goodwill of a capital NURSERY GROUND for SALE. A Bargain. Covering an area of 2 acres, adjoining Station in high class neighbourhood, North of London. Owner retiring in consequence of ill-health. Six Greenhouses on ground. Lease, 21 years. Rent, £75, nearly half let off. Premium, £200. Apply to Messrs. HARMAN BROS., 75, Aldermanbury, Guildhall, E.C.

NURSERY for SALE, or to be LET, near Blackheath, S.E., in working order. Land, 412 feet by 150 feet (more or less), at low ground rent. Contains seven Glass Houses, about 100 feet to 123 feet long, heated by three Boilers; three Cold Frames, about 100 feet long; Planting Ground, &c. Stock at valuation, if desired.—Apply to THOMAS PEACOCK, Warwick Square, London, E.C.

PROTHEROE AND MORRIS, HORTICULTURAL MARKET GARDEN and ESTATE AUCTIONEERS and VALUERS, 67 and 68, Cheapside, London, E.C., and at Leytonstone, E. Monthly Horticultural Register had on application.

Orchids.

Intending buyers are requested to communicate at once with— FRANZ GOETZE, Berlin, O., vor dem Stralauer Thore, 37. (Special Cultivation of Lily of the Valley Pips and Bulbs).

BULBS.—Our special offer of Daffodils, and other Bulbs for early planting, is now ready. Lilium candidum, 10s. and 12s. per 100; Lilium Harrisii, 5s. to 10s. 6d. per dozen; Roman Hyacinths, 12s. 6d. and 16s. per 100, very scarce; Narcissus (paper-white), 5s. per 100; Narcissus Double Roman, 5s. per 100; Gladiolus Colvilli (The Bride), lovely for cutting, 2s. 6d. per 100; Iris hispanica (the poor man's Orchid), finest mixed, 1s. 6d. per 100. Every article the best procurable. J. R. PEARSON AND SONS, Chilwell Nurseries, Notts.

FERNS! FERNS!—Trade.—Greenhouse and Store, 25 saleable sorts, in 2 1/2-in. pots, 12s. per 100; 10 best market sorts, in 4 1/2-in. pots, 6s. per doz.; stores, 6s. per 100. Large Adiantum cuneatum, value in fronds, 6s. and 8s. per doz. Cyperus, Aralias, Grevilleas, in 4 1/2-in. good value, 6s. per dozen. Palma, Fiens, & Dracynus, 1s. each. Hydrangeas, Pelargoniums, Marguerites, 9d. each; in 4 1/2-in. E. tremula and A. cuneatum, for making large plants quickly, 16s. and 20s. per 100, well packed, put on rail free for cash with order.—J. SMITH, London Fern Nurseries, Loughboro' Junction, London, S.W.

NEW & VALUABLE STRAWBERRIES

MESSRS. JAMES VEITCH & SONS

Are now booking Orders for the following magnificent kinds:

EMPRESS OF INDIA—GUNTON PARK—LORD SUFFIELD,

Raised by Mr. William Allan, gardener to the Right Hon. Lord Suffield, and known as the GUNTON PARK STRAWBERRIES.

ALL have received FIRST-CLASS CERTIFICATES from the Royal Horticultural Society; also the Highest Awards at Edinburgh, Wolverhampton, Earl's Court, and Norwich.

Price, 42s. per 100, 6s. per dozen. In small pots, 60s. per 100, 9s. per dozen.

"LORD SUFFIELD is a decidedly distinct variety, very sweet in flavour, the flesh firm and highly-coloured. The plant exhibited, to show its bearing-qualities and habit, left nothing to be desired. The fruit of GUNTON PARK shows a very fine, having borne the journey well. The plant sent showed this to be an excellent late variety, of robust growth, and an immense bearer. EMPRESS OF INDIA is the result of a cross between British Queen and Countess, possessing all the good qualities of both parents. Very useful for forcing."—*The Garden*.

"The Strawberries travelled the long distance between Gunton and here (Kingston) admirably, turning out as bright and fresh as if just gathered. EMPRESS OF INDIA has much of the old Pine flavour—the flesh is soft and smooth, and of a beautiful scarlet; a high-class dessert Strawberry. LORD SUFFIELD has firm flesh, of a rich crimson hue, and a delicious vinous flavour. GUNTON PARK is a large, somewhat Cockscomb-shaped fruit, of a deep blood-crimson; flesh very firm, and of striking flavour. This, being a great cropper, should make a fine market variety."—*A. Dean, in Journal of Horticulture*.

"I fully agree with Mr. Dean in his estimate of these Strawberries. They travel well, and are in colour, shape, and flavour excellent. They are worthy of a trial in large and small gardens."—*John Andrews, Hon. Sec. to the Woodbridge Horticultural Society, in Journal of Horticulture*.

ROYAL EXOTIC NURSERY, KING'S ROAD, CHELSEA, LONDON, S.W.

FOR SALE, through want of room, Specimen PALMS, DRACENAS, SHRUBS, YUCCAS, CAMELLIAS, Standard RAYS, and large FERNS, all established in pots and tubs.—STROUD BROS., 182, Green Lanes, Finsbury Park, N.

THE Gardeners' Chronicle.

SATURDAY, JULY 15, 1893.

ROSES IN THE DROUGHT.

WHERE the cultivation of a plant is so thoroughly artificial as that of the Rose, whose every want is not only attended to but anticipated by the enthusiastic grower, especially if he be an exhibitor, I do not imagine that the lessons of this long and terrible drought will be of a very valuable character. Of course, a great deal will depend upon the situation and soil, as well as on the supply of water, but I confess that on looking round my own small collection, there are one or two things that puzzle me. My garden is situated about 250 feet above sea-level, on the slope of a chalk hill, about two-thirds down. It is sheltered from the north and east, but fully exposed to the south and south-west; the soil is ordinary light garden soil, so that it is needful from time to time to put in some heavy loam to strengthen it. I grow my plants upon various stocks, Manetti, seedling Briar, and Briar outtings, and do not find any very great difference amongst them. (Of course, I do not grow my Teas on Manetti. I have a good supply of water, which, as I need not add, has been plentifully made use of this season. As my Roses have been in the same beds for many years, I determined last autumn to lift and replant them; this I did in every case, with the exception of one bed, and the drought has told upon the former most unmistakably. The plants are healthy, but they have not grown much, and there is an almost total absence of those long vigorous shoots coming up from the base of the stem on which we depend for the production of good blooms in the next year. The bed that was not lifted is just as vigorous as ever, forming a striking contrast to the others. I do not think, however, much is to be learned from this fact; we cannot foresee what the weather is likely to be, and therefore to say do not lift when there is any likelihood of drought would be utterly beside the mark.

A matter which has very much surprised me, considering not only the drought, but the immense amount of bright sunshiny weather we have had, is the almost total absence of aphides, and yet on all sides we hear, as might have been expected, the immense number and ravages of insect-pests of all kinds. I have not syringed my plants, or done anything to keep them clean, and yet with all that they are perfectly so; this at a time when the farmers around me have great difficulty in keeping down the insect plagues that infest their Hops. Should they appear, however, I think, from experience, that "Stott's Killright" will soon settle them.

But that the drought has had a most prejudicial effect on Rose blooms cannot for a moment be questioned; not only has this been manifested in the exhibitions which have taken place, but in our own gardens. In the northern parts of the kingdom, where the drought has been less severe, the

professional growers have had a great advantage, but it is hardly with them we can see so fully the effects of the drought. In going through the amateur's division at the National Rose Society's show at the Crystal Palace, one could not fail to be struck with the inferiority of the blooms. There were, it is true, some exceptions, but when a lady said of the best hybrid perpetual in the amateur's division, "bad is the best," and the exhibitor thereof assented to the criticism, we have a pretty sure indication of what the general character of the flowers was. How could it be otherwise? the bloom buds were hardly coloured before the bright sun forced them on, and the consequence was that flowers were thin, poor, and devoid of colour. But there was another enemy beside the drought we had to contend with, namely, the severe frost on June 1. Now, we are told by those wise gentlemen who know everything, and despise ignomines, that a dry frost is not injurious; but this was a dry frost, and amongst other cases I may mention the fact, that in my friend Mr. Haywood's garden at Reigate, 3000 buds injured by the frost had to be removed. Tea Roses, I think, suffered less, and indeed at one time seemed to rejoice in the drought and heat, although they, too, had but a brief existence.

There is another very serious matter in connection with the drought—namely, its effect upon stocks and upon the operation of budding; the loss in Briar stocks has been immense, and of necessity the prices of Roses must go up. Not only have standard stocks, but in some places even the Manetti has suffered, and I should imagine that the operation of budding will not be an easy or safe one this year; the bark will, I fear, be found difficult to rise, and the insertion of the bud not easy. On the other hand, we know that this kind of weather prevails very much in those portions of France where the larger quantity of Roses are cultivated; in fact, we are experiencing very much the same kind of weather as is habitual in Lyons and its immediate neighbourhood.

Such are a few of the facts connected with the drought, but, as I have said, they do not seem to me to convey any lessons worth recording. Such a season as the present is unprecedented. We may never have another, at least for another century, and I think the only advice that I can give to my brother rosarians is that of the Jack Tar to his messmate who had been ordered up to receive the cat, "that he must grin and bear it."

FRUIT TREES.

Roses and fruit trees are very often connected together in advertisements. There must be some recognised connection between them, and so I venture to add a few remarks upon the state and condition of my own garden, which is to me bewildering. We have always been told that, if we have a wet autumn, and, consequently, unripened wood, we must not expect fruit the following year. Now, in the months of August, September, and October of last year we had 370, 157, and 745 inches of rain. The wood looked green, sappy, and unripened, yet never have I seen such a wealth of blossoms as this spring. "Oh! yes," we were told, "but the blossoms are small, unfertile, and will not set;" however, they did set. Then we were told "Yes, but they will drop off;" but they did not, and I may safely say that during the 25 years that I have occupied this garden I have never had so large and so excellent a supply of fruit. Strawberries were perhaps the exception, but still they were fairly good, but of Raspberries, Gooseberries, Currants—black, red, and white, I have had a profuse supply of magnificent fruit. Apples and Pears promise equally well. I ate some very good Juneatings yesterday, and all the Apple trees, cordons, and standards are full of good-looking, healthy fruit. Pears are still more remarkable. I have four large trees, about 20 feet high, of Bon Chrétien, Bishop's Thumb, Berré de Capiaumont, and Comte de Lamy. These are all well covered with fruit, and it may be gathered from the fact that on a branch of Bishop's Thumb which had been broken off by the high wind two nights ago,

which was 4 feet in length, I counted forty-eight good fruit about the size of a small hen's egg. Pears on walls and bushes are equally productive; one large Walnut tree which is in my front paddock has bushels of fruit on it, and thus I may again repeat that all round, in spite of the drought, I have in my own garden experienced a most fruitful season.

One thing I have learned, and that is to increase my distrust of those gentlemen who form theories; as no one can tell us the cause of this terrible drought, so I do not believe that we can learn much about it. All that we can hope for is, that we may never have a recurrence of such a season. I need hardly say that my garden is thoroughly well cultivated, but I have seen exactly the same results in gardens around me; and good cultivation, although it may be very useful in seasons of drought, can have little to do with the large fruit trees of which I have written. It is all very well to tell the farmer that if his land is good and well cultivated, he can stand the drought better than others; but what with high rates of wages, low prices, and increasing county-council rates, it seems a mockery. He might well reply, as a member of a brass band did to his conductor, who told him to blow harder, "It is all very well to say blow harder, but where is the wind to come from?" *Wild Rose.*

NEW OR NOTEWORTHY PLANTS.

EPIDENDRUM WENDLANDIANUM, *Kränzlin, n. sp.**

HERE we have a new Epidendrum, and a very nice one, too. The flowers rise one to three on each flower-stalk, and are of a very bright colour. The sepals and petals are light green, the labellum is snowy-white, with dark purplish lines on the side-lobes; the gynostemium or column is likewise coloured dark purple. The diameter of the flower is nearly 2 inches; the labellum has two small side lobes, and a much larger cordate mid-lobe, with three elevated veins in the middle, and a hairy cushion at the base. It is very difficult to explain the affinities of this plant; it is quite unlike all the numerous species figured in botanical works up to the present time. To begin with, the internodes of the rhizome and to end with peculiarities of the column, we never found such a combination of characters. *Epidendrum tripunctatum*, Lind., is perhaps the nearest to it. It is to be hoped that this very pretty novelty will find its way into our collections; the culture seems not to be difficult, the plant thriving well in the cool-house. I received fresh materials twice from Mr. H. Wendland, of Herrenhausen, near Hanover, who received it, I believe, from Mr. F. Sander. The plant is a native of Mexico, and was collected by Abel; it flowers at midsummer—a season not very rich in Orchids; the flowers remain for a long time in good perfection, and strong specimens have many of them. *F. Kränzlin.*

GOOSEBERRY WHINHAM'S INDUSTRY.

ROBERT WHINHAM, the raiser of this variety, was born early in this century, and up to within a few years of his death in 1858, he occupied as tenant the Allery Banks Gardens, belonging to the Earl of Carlisle, at Morpeth. There it was that he first began cultivating and propagating the herry. All

* *Epidendrum Wendlandianum*, Kränzlin, n. sp. § *Eocyclia*—Sepalis petalisque lineari-lanceolatis acuminatis patulis; labelli lobis lateralibus oblongis obtusis margine subrepanda columnam amplectentibus, lobo intermedio multo majore late cordato acuto sepalis petalisque brevioribus, disco medio elevato lineisque 3 elevatis a basi apicem usque decurrentibus, disco in lobos laterales pulvinato-piloso; gynostemio libero lato apice in dentes 3 exunte, quorum laterales oblongi obtusi, dorsalis nitem late ligulatus apice rotundatus. — Flores 5 cm. diametro, sepalis petalisque viridi-illa, labellum 2 cm. longum (lobus intermedius 1.3 cm. latus); album, lobi laterales violaceo-striati. this time, the labour, and the thought he expended in perfecting his venture profited him but little in the shape of pecuniary reward. He died a poor man. His grave in Morpeth Churchyard is known to but few, and no memorial of him exists other than which he established himself by giving his own name to the fruit he originated.

Situated on the rising ground to the south-east of Morpeth, and in close proximity to the railway, we found the scene of his labours. The summer evening was closing in as, escorted by Mr. George W. Purdy, the present tenant, we wandered through the garden, which is almost entirely given over to the cultivation of Gooseberries. Mr. Purdy's father immediately succeeded the Whinham family in the tenancy, and when he took over the garden he found there bushes of the identical berry which must have been some of the very first cultivated by Whinham. These bushes had then reached maturity, and some of them yet remain in very vigorous growth. One of these, which cannot possibly be less than 47 years old, has cropped heavily ever since 1856. Last year it yielded three and a half stones of berries; this year it is still more heavily laden, and the estimated weight of the crop is four stones.

It was an interesting fact to learn that when Whinham left them, nearly all these old bushes were layered, and when roots were formed, the layer was separated from the bush with the spade and planted as a separate bush. Such was the method of propagation followed at that time. Now-a-days, however, increase is by means of cuttings, which is a much more rapid system than the old one. At the time to which we referred, however, the young bushes were not considered of any very great value, as Rildeman and Ashton Red were varieties that held what market there then was, and it must be remembered that was prior to the time when the enterprise of the fruit-preserving firms created a demand for the Gooseberry.

Though the two are naturally in some degree inseparably connected, the chief pecuniary interest, so far as the North of England is concerned, does not, however, centre in the production of the berry, but in the sale of the young bushes. When they reach the age of two or three years, the young plants command a high market price, and are in demand in many quarters of the globe. The United States and Canada, where they were introduced some ten years ago by Mr. R. Smith, of Worcester, are still our largest customers. Provided the plant is allowed a full three years' growth in this country, it does well in America, and bears well up to twelve years; after that time it begins to deteriorate, and has to be renewed. A few years ago the demand so far exceeded the supply that the Americans would take anything they could obtain in the shape of young bushes. The natural consequence was that much inferior stuff found its way into Brother Jonathan's gardens. A certain percentage of the bushes did very badly, and the American gardeners, becoming alarmed, sought some means of protection from what they supposed was the advantage taken of them by their English confrères. They thereupon agreed that a certain standard of excellence should be set up and adhered to in the importation of the bushes. The rules regulating the trade now, therefore, are that three-year-old bushes must have from five to seven good branches; two-year-old bushes three or four branches, and all bushes to be thicker than an ordinary lead pencil. One-year-old bushes they will only accept in a year of scarcity.

The bushes sent from Northumberland, and especially those sent from Morpeth and Hexham, are preferred before any others. France, Germany, and Holland are all cultivating "Whinham." Competition even in our own market of Newcastle is becoming somewhat keen in the herry line. The Dutch, from the bushes they have obtained, are able to compete with growers in Northumberland, and they are now sending in large quantities to our markets. In size, juiciness, and in flavour, they are, however, not to be compared with those of English growth, and the only thing that can be said in their favour is that they are earliest on the market. Boilers buy them

at a cheap rate, so that notwithstanding the fact that sugar is dear this year, the price of English jam, made with German Gooseberries propagated in Northumberland, remains "statu quo." *Newcastle Chronicle*, June 29, 1893.

GROWTH AND CULTURE OF AZALEA INDICA.

(Concluded from p. 34.)

SUMMARY OF ANALYSES BY M. G. TRUFFAUT.

Constituents accumulated by one Plant of *Azalea indica* during Three Years of Growth.

Parts of Plant.	First Year.	Second Year.	Third Year.	Total 3 Years.
<i>Dry Substance.</i>				
By leaves	0.941	8.235	15.475	24.651

Total	0.001	0.015	0.026	0.042

These results show that the largest amount of dry substance of the *Azalea* is accumulated by the leaves, and next by the roots.

The foliage yields more than one-half of the whole nitrogen collected, and nearly three times as much as either the stems or roots.

Stems and leaves are about equal in their absorption of lime, and give about four times as much as the roots; while the element potash is fairly distributed over the three plant organs enumerated.

Silica, as might be expected, is the principal constituent of the roots, the leaves, however, giving four times as much as the stems.

Iron is not a very conspicuous ingredient in the composition of the *Azalea*, but, like potash, is about equally distributed over the whole plant.

In conclusion, it may be asked, what is the significance of these facts? In the first place, it is that the character of development of the *Azalea* depends very much upon the proportion of nitrogen available within the soil, for where there is restricted growth of plant, there will not be vegetative activity, or great accumulation of texture-forming substances, from which the plant must eventually rely for flower formation and maturation. But in order that the

nitrogen may work successfully, it becomes absolutely necessary that there shall also be plenty of available minerals in the soil to dilute the nitrogen. For there can be no doubt that strength of plant depends on favourable development of the woody substance, and the more this prevails, the more will the accumulated nitrogen be diluted—in other words, show a lower proportion to the other constituents. *J. J. Willis, Harpenden.*

CONCERNING PARSLEY.

ONE can only imagine what our garden Parsley was like, when, as is generally understood, it was introduced to this country about the middle of the sixteenth century, though some assert the plant is indigenous to Britain. Philip Miller, in his *Gardeners' Dictionary* (1731) speaks of it under the name of Apium as "an herb so well known that it is not worth while to say much about it; every old woman in the country that hath a garden knows how to cultivate a Parsley-bed." He mentions the curled Parsley, and "the great garden Parsley, which is at present little known to us in England, but in Holland it is very common in all their markets; they bring these roots in bunches as we do young Carrots to market in summer, and the roots are much of the same size." This is no doubt what we cultivate in this country in the present day under the name of the Hamburg or Turnip-rooted Parsley. Miller adds: "The curled Parsley is sown in some curious gardens for garnishing dishes, the leaves, being curiously furbelowed, answer this purpose very well." A catalogue published in 1817 gives the same cultivated varieties of the Parsley as Miller does—the plain or common, the curled, and the Hamburg or Turnip-rooted. Of late years the garden Parsley has been considerably improved; specially selected forms have had distinctive names given to them, such as Myatt's Garnishing, Moss-curled, Fern-leaved—the two last-named being very ornamental and strikingly handsome, Lincoln Green, Beauty of the Parterre, &c. Lincoln Green is a selected form of the Curled, not so densely curled as some other selections, but of a very bright green colour—hence its name. Beauty of the Parterre is like Lincoln, green, bright in colour, but rather coarser. Myatt's Garnishing is simply a good strong-growing selection from the Curled, and therefore well adapted for field culture, many acres of land in the home counties, and especially in Bedfordshire, being devoted to Parsley. The Moss-curled is greatly esteemed for its dwarf growth and its handsome curled character, and when well selected, it is perfect as a garnishing Parsley. The Fern-leaved has a fine Fern-like habit of growth, hence its name, and both show what can be accomplished by means of persistent selection.

The use to which Parsley is put, whether raw or fried, is for flavouring, garnishing, &c., the leaves being highly aromatic. Plain Parsley is employed in some parts of the country for agricultural purposes, and its leaves are eaten by most of our herbivorous domestic animals, particularly sheep; and from its being believed to act as a preventive of liver-rot in that animal, it has been recommended for sowing in their pastures, but its use in this manner is declining rather than extending.

There are two types of the Hamburg or Turnip-rooted Parsley. One known as the Early, the root resembling that of a short thickish Parsnip; and the Late, which has a root like a long thin Parsnip—and it is the latter which is in somewhat limited use in this country. But as one is but a selection from the other, they are apt to run into each other. The root is used by some for eating with fish. The top is like that of the common Parsley.

The Parsley is such a commonly-grown subject, that it seems scarcely necessary to say much about its culture. In the Bedfordshire market gardens it is a common practice at the time of sowing the pickling Onions, to sow a little Parsley seed with them, and also in thin beds of marketing Onions. When the crop is gathered, there is a valuable plantation of

Parsley for the winter and early spring months—large, handsome specimens, having ample space in which to develop. It is curious to note how well a self-sown plant will do in a garden, to what a size it grows, and almost invariably it is handsomely curled. I have known gardeners to depend upon chance plants like this for a supply of seed to sow. Such a self-sown plant suggests two points in successful culture: One is to give the plants plenty of room; the other to allow them to remain where they are sown, refraining from transplanting them as far as possible.

A well-tilled, but well-manured, rather heavy loamy soil suits the Parsley; in such a soil its fleshy roots penetrate deeply and strongly. Some sow Parsley in February, in May, and again in July, in order to have a succession; others are content with a sowing in April, and transplanting at different times. In our London market gardens, it is the usual practice to sow successively from March to August, and invariably where the plants are to remain; for it is said the effect of transplantation is to cause inferior foliage, as well as to induce the plants to go to seed earlier. The Parsley being a biennial, it is usual for it to flower the following season, and then it is practically useless for picking purposes.

In some soils it has been found difficult to grow Parsley with anything like success: either the soil is unsuitable, or the ground has become Parsley-sick, which probably means the plants are attacked by a kind of canker; a brown rust settles upon the main stem, decay sets in at the roots, and the plants die. This seems to suggest that a change of soil is necessary—at any rate, it is well to deeply till and make it fairly rich, to secure a vigorous growth, and a fine curled character.

One curious fact connected with Parsley is, that a certain amount of superstition gathered about the plant, and it was considered unlucky to transplant it; and in the Midland Counties especially, few persons could be got to perform such an act. This superstition may still exist in places, but there is no doubt Parsley is frequently transplanted, and as far as we believe, without any of the penalties attaching to the act which at one time was asserted would follow. Enormous quantities of seed of Parsley pass through our wholesale seed houses during the year, to an extent that appears incredible; but it serves as an illustration of the fact that scarcely a garden in this country, large or small, is without its bed or plantation of this thoroughly useful English plant. *R. D.*

FLORISTS' FLOWERS.

THE AURICULA.

THE excessive drought is a new experience to the present generation of gardeners, and it would be interesting if we could obtain some record of its effects upon the various subjects under our care. It has generally been supposed that a hot dry season was the very worst for Auriculas. This was impressed upon me nearly thirty years ago by reading the papers upon the Auricula by the Rev. H. H. D'Ombra, who had, even at that time, much experience of its culture in the south of England, when I knew nothing of its management outside the land of "brown heath and shaggy wood." My own experience this year has led me to the conclusion that the show and alpine Auriculas both can be steered safely through a very hot and excessively dry season if they are well cared for; the worst effects of such a season is the rapid production of aphides—it is simply marvellous. In spring and autumn the increase of these insects is slowly effected by eggs hatched as the weather increases in warmth; but, at present, they do not wait for the slow process of egg-laying, the insects become viviparous, and eject perfect insects at a rapid rate—and these, in their turn, are not slow to carry on the same rapid system of propagation. The Auricula is sure to be attacked by this insect, and the hot weather favours its rapid development; they must

be brushed off the leaves, and this is the way that most amateurs deal with them—but where there is a large number of plants, it may be necessary to fumigate them with tobacco smoke. Dipping the plants in soft-soapy water is effectual. When they are clear from insect pests the growth is healthy, and excessive heat is counteracted by shading from hot sunshine. I have usually repotted a number of plants after the seed has been gathered in July, but it would not be wise to do so this year, as the excessive heat would certainly be disastrous to newly-repotted plants. The work will be left until cooler weather in August, and, at that time, offsets root well in a shady place in close hand-lights. The seed ripened about the third week in June, and was sown at once; we place the seed pots or pans in hand-lights, on the shady side of a wall, and it vegetates to a certain extent in about three weeks; but much of it lies dormant until the spring, when the parent plants wake up into active growth. The seedlings of last year are not making such good growth as I would like, but they will doubtless progress more rapidly when the nights are longer. Auriculas, whether they are seedlings or established plants, make more rapid growth in the spring and autumn than they do at any other season. The small plants should be potted on as they require it; delay in this is injurious to them. Alpine Auriculas, and all the Primula family out-of-doors, have suffered by the intense heat; but where they have been freely watered, the losses are inconsiderable—indeed, in a large bed of alpine Auriculas, two years established, not a plant has failed.

THE HOLLYHOCK.

This stately plant does not seem to suffer at all from the heat, and, what is very remarkable, I have seen no trace of the parasitic fungus which destroys the leaves (*Puccinia malvacearum*). This pest seems rather to delight in damp weather, lying dormant in a drought. I have always recommended a rich deep soil for these plants; and this season, with plenty of water, the growth is excellent, the leaves clean and free from red-spider, which is generally troublesome. The side growths should be utilised for cuttings, or they may be propagated from eyes, like Vines; bottom-heat is not necessary—in fact, a brisk bottom-heat is injurious, causing some of the eyes and cuttings to damp off. I find they do in a hot-bed from which the heat has nearly but not quite gone; the propagating pots ought to be plunged to the rims in cocoa-fibre refuse, or something similar. They are usually full of moisture, and an over-supply of water causes many of them to damp off. If the frame is kept close, and shaded, not a great deal of water is needed; it is better not to give any for two days after putting them in, but the soil ought to be sufficiently moist to start with. Good soil to strike the cuttings and eyes in, is composed of one part loam, one of leaf-mould, and one of sand. The flowers are now developing freely, and are of full size. See that the centre stems are supported by stoutish sticks, and do not neglect to fasten the upper part of the stems to them, for if a high wind gets up suddenly, the flowers are likely to be damaged by the wind swaying them backwards and forwards against the sticks. The stems are very short this year, the flowers in some instances having begun to open at less than a foot from the surface of the ground. All such plants derive great benefit from the surface of the ground being mulched over with decayed manure, through which the water should soak. We have used this year a great deal of the peat-litter manure to mulch with; it can be used fresh from the stables, and it seems to cause a most vigorous growth. For Carnations and Pinks it is excellent.

PANSIES AND VIOLAS.

No plants derive greater benefit from this mulch of short manure than these, but a mixture of cow and stable manure is best; peat should be omitted. The Pansies and Violas gave great satisfaction until the end of June, when the quality of the flowers fell off. This will happen in ordinary seasons, and they do not produce full-sized well-marked flowers until

they have a fresh start. This is accomplished by picking all the flowers from the plants, removing the growths if they are too crowded. Mulch the surface with manure finely broken up, and peg down the growths firmly into it. Give them a thorough soaking with water if the ground is dry, and the plants will grow freely again, producing flowers of quality nearly equal to those upon the plants in their early stages.

It is now time to get the cuttings in, to produce strong blooming plants in the spring. There are generally at this season numerous slender growths at the centre of the plants; these, if slipped out with the fingers, make excellent cuttings, in fact, most of them will have rootlets attached to them.

An amateur friend was talking to me only yesterday about propagating the Pansies and Violas, and was much surprised to find that it was unnecessary to plant them in frames and hand-lights. We have greater success when they are planted in fine soil in the open garden. Those who possess gardens walled around, and with aspects to all four points of the compass, have a considerable advantage over those who have none. For Pansies, Pinks, and such things, we merely provide some fine sandy soil on the border behind the north wall, and dibble them in rows 3 or 4 inches apart, and 3 inches asunder in the rows. See that they are kept moist, and few will fail to root freely. It is well to dip the cuttings in some soft-soapy water before planting them, as a precaution against thrips, and a destructive aphid of a reddish tinge. Any other of the numerous solutions may be used. *J. Douglas.*

TREES AND SHRUBS.

GENISTA ÆTNEENSIS, *De Candolle.*

This is one of the larger growing species of Genista, attaining a height of from 8 to 15 feet. Like others of the same family, it is one which thrives on poor sandy soil much better than many shrubs would do—a fact which considerably enhances its value. At Kew there are several large bushes in the wooded part of the garden, and when in full flower they look particularly bright amidst the surrounding greenery. It is in such positions, indeed, that it is seen at its best, being of sparse habit, and having its slender terete branches practically devoid of leaves. In this respect it has somewhat the character of the Spanish Broom (*Spartium junceum*)—*Spartium* was, in fact, the genus under which it was at one time placed. The flowers are of a clear bright yellow, and when the plant is growing in an open sunny position, they are produced in great profusion. According to London, it is found wild on the slopes of Mount Etna (as is implied by the specific name), occurring at elevations of from 3000 feet to 6000 feet, frequently in company with *Acer monspessulanum*. It is a native of other parts of Sicily, as well as of the neighbouring island of Sardinia. It was introduced to Britain in 1816. It is readily propagated by seed, which it ripens in fair quantity every year.

ESCALLONIA PHILLIPIANA, *Mast.*

Not only is this species one of the most distinct of Escallonias, but it is the hardiest. In the neighbourhood of London (where it has been grown in the open without any protection), it has not suffered in the slightest during the trying winters of the past few years. It is one of many delightful hardy fruits for which we are indebted to the enterprise of Messrs. Veitch—their collector, Pearce, having introduced it from Valdivia about twenty years ago. The original description, with an illustration of it, are given in the *Gardeners' Chronicle* for July 27, 1878. Our largest plant is now about 4 feet high, and is a compact, many-branched, and elegant shrub, but it will, in all probability, eventually attain to much larger dimensions. Every shoot is at present crowded with small white flowers, which are one-third of an inch across, and both in shape and colour remind one strongly of the well-known greenhouse plant, *Leptospermum scoparium*. The

leaves are proportionately as small as the flowers, and are quite smooth, almost sessile, and of a rich green. It may be propagated with the greatest ease by means of cuttings taken in late summer, striking them in sandy, light soil, in a close frame. As a hardy shrub of great beauty and interest, as well as a "good doer," it is to be strongly recommended. *W. J. B.*

LILACS.

The most widely diffused species of this beautiful shrub are the common Lilac (*S. vulgaris*), Persian Lilac (*S. persica*), and *S. chinensis*, the Varin Lilac or Lilas de Rouen.

The common Lilac is of itself more widely grown and cultivated than are all the others put together. Its importance in horticulture is such that we believed it worthy of a special article, describing its various uses and the methods of culture employed. Nevertheless, the other species are treated in the same manner as regards their multiplication and their ornamental uses in gardens. Although common everywhere now-a-days, this beautiful shrub is not indigenous to our soil, the most reliable authorities now assign it to the region of the Danube, and M. Ed. André mentions having seen it growing wild in the mountains dividing Servia from Bulgaria. Its introduction into the gardens of Western Europe dates from the middle of the sixteenth century. M. Baltet attributes it to Busbeck, ambassador from the Netherlands to Constantinople in 1562; but M. Franchet says that "the first definite mention of the plant dates back only to 1565, and is owed to Matthioli." At any rate, it increased rapidly in gardens, and has since produced many varieties and florists' forms. The common Lilac plays three important parts in gardening:—

1. It decorates, owing to its bushy habit and fine foliage, thick shrubberies in the most charming way, so that there is no garden in which some plants of it are not to be found.
2. The abundant flowers, opening in fine terminal clusters in early spring, exhale a delicate perfume.
3. It is now-a-days extensively grown for winter forcing; the trade in Lilac is a most important one.

We will now consider the methods of multiplication, culture, and forcing employed:—

Multiplication.—Lilac being a trailing shrub, possessed of an abundant root-system, its multiplication is most easily effected by simply separating the suckers, which grow in abundance round the stock. At the same time this method is only applicable with the type and the most common varieties. Also, it may be propagated by means of woody cuttings, which root easily in the open ground, almost without any attention. Multiplication for industrial purposes of the finest horticultural varieties is effected by budding in July. Cleft or even crown-grafting may also be employed for large stocks as standards or dwarfs, but this course is only exceptionally pursued. Moreover, stocks destined for grafting are raised from seed, as they produce fewer suckers than those raised from cuttings. This process is effected as it is with most other hardy shrubs, the seeds are sown in spring, in beds and broadcast. The plants are placed in a nursery to graft when they are two or three years old; then they are put out two or even more years later, if they are for sale, as Lilac is one of the shrubs which bears transplantation best.

Culture.—Lilac is adapted for every soil; it bears drought as well as damp, when neither is excessive—in fact, as long as not too deeply shaded or too much exposed to inclemency, it is not affected, and the most intense frosts leave it scatheless. Yet the pains taken with it, the work, manuring, pruning, &c., are not thrown away, as it then becomes very vigorous and produces large and numerous blossoms. As the flower-buds are always found at the summit of last year's shoots, it is evident that pruning it in spring, before the leafing is over, checks all the flowers, therefore it is just after blooming that it should be submitted to this operation when necessary, but we haste to say it is only when a particular form is required, usually that

of a small tree, or when it attains to too ample proportions that such a course is necessary. Lilacs are easy to cultivate in pots or tubs of suitable size, thus do nurserymen raise them for market, and amateurs frequently grow large specimens for terraces or balconies in this way.

Forcing.—From a commercial point of view the winter forcing of Lilac is now a very important

as it is known that for such use the red Lilac (*S. purpurea*), known as Marly, is principally employed, Charles X., and also the Persian Lilac, being used frequently. The white forced Lilac lasts for the greater part of the year; it may, doubtless, also be produced all the year round, if the specialists found it a remunerative experiment.

Forcing is usually practised in darkness and little

Stoves.—The houses devoted to this purpose are low, without stages, and furnished with a good boiler that can maintain at will a temperature of at least 25° (76° Fabr.). They are carefully covered with matting, to produce total darkness, and at the same time to prevent the escape of heat.

Preparation and Instalment of Plants.—The plants are taken up, with a good-sized ball, some time before forcing them, so that they suffer slightly from drought. Then, when they are brought into the house, all suckers and every branch deprived of flower-buds are cut away, as well as those too feeble to produce good clusters; in a word, their toilette is rigorously performed. They are then planted in the house, close together, their balls being covered with an inch or two of earth, and they are then freely watered.

The Work of Forcing.—The temperature of the house should be gradually brought up to about 25° (77° F.), and so long as the flowers do not show, the branches must be syringed several times a day, and the earth copiously watered, to keep the roots constantly moist. Those shoots which develop too luxuriantly must be suppressed, as they tend to spoil the bunches. When the flowers are a little advanced, the syringing should cease, as this tends to spoil, or at least to soil them. According to the intensity of forcing, the flowering will take place in about the third week; if a temperature of only from 18° to 20° (64°—68° F.) be maintained, forcing will take more than twice the time, but the flowers are of better substance, and the bunches of better form. When the flowers are ready to open, some of the matting is removed, to let in a little light on the flowers, and even, if the weather permits, a little air may be admitted. These two elements give a certain substance to the bloom, and also render it more lasting. It is advisable to cut the flowers in the afternoon, then to let them pass the night in fresh air, with the stem in water.

Natural Coloration.—To obtain red Lilac, the forcing is conducted on the same principle; but instead of complete darkness, a soft light is, on the contrary, allowed to reach the flowers. They are shaded only from the hottest sun, and allowed air by raising some of the lights, save when the weather is too cold, and, in cases of need, a length of matting is left over the aperture, so as to temper the air; the temperature should in this case be left at about 15° (66° F.). The duration of the forcing is then about twice as long as for the production of white Lilac, but the produce fetches a better price.

Artificial Coloration.—The rage is now more than ever for colours, and the idea of tinting flowers, which is not altogether novel, was put into practice last year for the raising of green Carnations, and this year actually for the culture of multicoloured forced Lilac. Thus, one sees in the windows of the principal florists, Lilacs tinted azure-blue, golden, or chrome-yellow, gooseberry-red, and salmon-pink, these colours being of very pure and uniform tone. It is by immersing the stems in colouring liquid, that is to say, by the ascension of the liquid into the cells, that the dyeing is effected. The aniline dyes used are, according to M. Fieurand, methylene-blue, methylaniline-violet, orange No. 11, eosine, &c. We may further remark that this method by endosmose is comparatively new, and quite different from those formerly employed, such as steeping the bloom in corrosive liquids, with a basis of potash or soda, or their exposure to ammoniacal or sulphurous vapours. The absorption of the colouring matter by the plant itself affords, especially for Lilacs, very remarkable results, and in spite of the aversion felt by true plant-lovers for artificially-coloured flowers, it would be rash to foretell the probable results of the scheme in the future.

Old Plants.—The flower-gathering completed, the house is at once cleared for starting a second series, and with the principal specialists the operation is repeated eight or ten times successively during the same forcing season. The plants, when taken from the house, can, after growing for two years in the open air, serve again for forcing. For this purpose all late buds are checked, or they are cut down

FIG. 13.—VIEW IN FERN HOUSE IN MR. MAY'S NURSERY. (SEE ROYAL HORTICULTURAL SOCIETY'S REPORT, P. 70.)

trade. The industry originated in France, and M. Baltet attributes the first practice of it to Matthieu, of Belleville in Paris, quite a hundred years ago. At the same time, this method was not largely employed until long afterwards; during the last thirty years in fact. It has so rapidly increased in importance, that each year more than a million and a half plants are forced in the neighbourhood of Paris. The custom is, in fact, followed to a small extent everywhere, but nowhere so largely as here. The process is altogether a forcing and bleaching,

air, but it seems now certain that white Lilac can be grown in full light also, and from the same red variety; by greatly urging on the forcing, the colouring matter has not time to develop. Also for the last ten years, red Lilac, more or less forced, has been obtained by giving gentle heat and a little air; its production has greatly increased during the last ten years. In spite of its great elegance, fault may perhaps be found with its poverty of foliage, but the skill of the florist atones for this deficiency, as they replace it with that of other plants.

quite to the old wood; then put in the nursery. These plants also serve to decorate plantations, form hedges, or even furnish slips or cuttings.

Diseases.—Lilacs suffer little from attacks made upon them by fungus or insects, although parasites are relatively numerous on them, their ravages are often unnoticed. These are the chief pests:—

Fungus.—It is chiefly the leaves which suffer from this. Sometimes it is a species of *Oidium* which covers them with close and whitish filaments; sometimes *Fumago vagans*, common also on many other shrubs, forming on them a sort of blackish deposit; above all, green-fly attack the tree, as it seems that the honeyed secretions of this insect serve as the support of the fungus. Syringing with soapy-water is an easy remedy. The brown spots made by *Ovularia Syringæ* should also be noted. Many other Cryptogams, almost the entire order of *Pyrenomyces* have also been found on Lilacs, but their ravages being insignificant need not be noticed.

Insects.—The principal insects living on Lilac are the nocturnal Lepidoptera, and especially the Privet Sphinx, one or two Noctuelles and Geometers, and one Privet known as *Gracillaria syringella*. The larvæ of this latter insect first attack the leaves, then roll themselves in them for protection, and when fully grown drop to the ground to undergo their metamorphosis. The wings of the perfect insect measure scarcely a third of an inch in span. The only remedy, when necessary, is to collect the leaves affected, and burn them.

Varieties.—Florists' varieties of Lilac are excessively numerous, but the scale of colour is not wide, varying only from pure white to lilac-purple, but the dimensions of the bunches and the size of the flowers serve to distinguish them. Some amongst them are much sought for trade culture as choice plants. Double Lilacs (of which there is already a selection, though only recently obtained) have not the elegance of the single ones; still, some are now very pretty and interesting. It is noted that when forced they become lighter and more decorative. In conclusion we name a few varieties of the two kinds:—

Single.—Alba grandiflora, Charles X., Dr. Lindley, Madame S. Morel, Marie Legray, De Marly, La Veige, Souvenir de Louis Spach, &c.

Double.—Linné, Lemoinei, Mathieu de Dombaale, Michel Buchner, Madame Lemoine, ranunculiflora, rubra plena, &c. *S. Mottet, Paris.*

NURSERY NOTES.

MR. S. MORTIMER'S NURSERY, ROWLEDGE, FARNHAM, SURREY.

VISITORS to the Metropolitan and other horticultural exhibitions have, doubtless, observed the fine displays of Cucumbers, Melons, and Tomatos, which are Mr. Mortimer's great specialties; not that he confines his attention to these alone, for he cultivates—and cultivates well—a general nursery stock. The intention of the writer is, however, to say something about the specialties.

The spot chosen by Mr. Mortimer for his nursery is one very highly favoured by Nature in some respects. For instance, it lies high on the top of a hill; and although in the surrounding valleys people are suffering from a want of water, here there is a plentiful supply. A fine healthy atmosphere prevails; the early and late frosts are often escaped, whilst in the valleys they are very destructive. At the time these notes were taken, the earliest houses devoted to Cucumbers and Melons were over, four houses having been cleared of ripe Cucumbers; in two of these were grown the new varieties Princess May and Prince George, which, it may be remembered, Mr. Mortimer exhibited in his fine group at the recent Temple show of the Royal Horticultural Society. They will be exhibited again later in the season. It is quite worth noting that the Cucumbers and Melons here are grown in very shallow beds, giving them not more than 6 or 8 inches of soil; this, with the help of fertilisers give much better results than the old-

fashioned deep beds, which, some thirty years ago, were sometimes 6 feet deep. The new Cucumber, certificated last year by the Royal Horticultural Society under the name of Success, or Sutton's Peerless, is proving a very fine variety, exceedingly dark in colour, with numerous spines—a very finely-flavoured variety. The present has been a very good season for Melon cultivators, and a fine heavy lot has been produced here; those named Al and Empress are found, without exception, to be the best-flavoured scarlet-fleshed kinds, and where a good show of Melons is wanted, Conqueror and Golden Perfection are the best. A span-house was observed of that truly famous variety, Hero of Lockinge, just netting, being grown for seed purposes. Mr. Mortimer—and he is no mean judge in such matters—thinks it is the prettiest house he has ever had—every fruit as true as though they had been cast in one mould.

The two very best Tomatos (and a good many varieties have been grown here) are found in Earliest of All for very early work, as it is such a wonderfully free setter—hundreds of trusses have been produced here this year with sixteen and eighteen ripe fruits on each of them; and Sutton's Perfection, which presents the finest type of smooth Tomato in cultivation.

Passing on to the floral department, a very fine house was noted of *Celosia plumosa*. Mr. Mortimer took this class in hand some eight years ago on settling down here, and has much improved it. At that time he had in them a percentage of plants which bore small combs on the tops of the plumes; here is a strain which gives perfect plumes, twisted and curled, many of them, like ostrich feathers, and in splendid variety of colours. A 60-foot house is devoted to seedling Coleus, for seeding purposes. In these every variety of colour almost may be seen.

Dahlias are largely in request, an acre and a half being devoted to them. A fine bed of seedling show and fancy varieties selected from a large quantity grown last year will, it is hoped, give some good new varieties for the autumn exhibitions. Fuchsias are grown in large numbers for the trade, also many thousands of bedding-plants, for which there is a good demand. A large stock of trees, shrubs, &c., is also being worked up, adding fresh and interesting features to a nursery that will, in time, compare very favourably with similar establishments of much older growth. *J. B.*

THE VICTORIA REGIA AT CHATSWORTH.

IN our last issue the name of Chatsworth was inadvertently omitted from the list of places given where the cultivation of the *Victoria Regia* is carried out, as Mr. Owen Thomas, formerly the Duke of Devonshire's gardener at that fine place, and now of Frogmore, has kindly pointed out. There was, however, we believe, a short period during which its cultivation there was discontinued—a fact that our correspondent, probably, had in his mind when he penned the note.

Our illustration (fig. 14, p. 63) shows the *Victoria*-house at Chatsworth in its palmy days.

PIERRE POIVRE (1719—1786).

(Concluded from p. 35.)

THE Island of Bourbon and the Isle of France were no longer under the *Compagnie des Indes*, which had ceased to exist, and since the departure of Labourdonnais their affairs had fallen into a state of disorder and neglect. Poivre had been granted extensive powers, but, unfortunately, his intentions were greatly marred by the military executive governor. For six years he administered the civil government of the two islands, and by unremitting perseverance brought the colony out of debt, and inaugurated an era of prosperity.

In 1770, when there was a scare of imminent war with England in the east, the French Government despatched ten thousand men, soldiers, sailors, and

marines, to the Isle of France. The vessels which conveyed them landed these men destitute of all supplies. "I well knew that they would want everything," wrote M. de Choiseul, the minister, to Poivre, "but you were there, and I counted on you." Nor was the minister deceived, for Poivre, in spite of two hurricanes, which successively ravaged the island in February and March, 1771, when the troops reached their destination, managed cleverly to provide them and the ships with supplies from the Cape, paid for, moreover, by bills which he persuaded the Dutch to accept, but which were not eventually paid until fifteen years had elapsed.

Among other good deeds which Poivre accomplished, we must not forget his benevolence towards the slaves and black population. The white colonists, or rather, the most unscrupulous among them, did not hesitate to use their black slaves as beasts of burden, both in Bourbon and the Isle of France. Poivre introduced a law by which it was rendered a contravention of the law to load any black with a burden of more than sixty French livres in weight, and any negress with more than fifty pounds; hitherto they had been accustomed to put one hundred and twenty pounds weight on the heads or shoulders of the black men and women alike.

Mr. Poivre was not a botanist in the scientific sense of the word, but he was nevertheless a great introducer of economic plants into the islands under his charge. For instance, it was under his auspices that the following plants were cultivated in Bourbon and the Isle of France with success, viz., the Bread-fruit tree, *Artocarpus incisa*, and the Jack, *A. integrifolia*. (M. Dupont de Nemours also mentions a large-fruited green Mulberry from Madagascar named *Ampalis*, and a tree from which an essential oil is obtained, like otto of Roses.) The Travellers' tree, *Ravenala* sp., from China he brought the Tea-plant; from the West Indies the Logwood; from Ceylon the Cinnamon; and from the East Indies the Nourouk, the various Coco Palms, Dates and Mangoes, the All-spice; from Europe the Peach and Apple; the Avocado Pear from the Antilles; the Mabelo, *Diospyros discolor*, from the Philippines; the Sago Palm from the Moluccas; the Savonier, or Soap-nut, *Sapindus detergens*, from Hindustan; various timber trees, &c. But he was most celebrated for his successful introduction of the Clove and Nutmeg plants into the French colonies, for hitherto the Dutch had possessed the monopoly of these important spices. Under his administration M. Provost, an experienced supercargo of the French East Indian Company, who spoke the Malay language fluently, was furnished with letters from the French Government to various East Indian potentates.

In May, 1769, M. Provost started in the *Vigilant*, commanded by Lieutenant Tremigon, in company with the *Étoile du Matin*, under Lieutenant D'Etcheverri. This small expedition proceeded in the first instance to Manilla, and thence to Mindanao and Yolo, whose prince regarded M. Poivre with veneration. The ships then sailed to Miao, where, however, the Dutch had destroyed all the spice trees. Provisions now failing, the vessels separated, M. de Tremigon going to Timor, and M. Provost, with M. D'Etcheverri searching throughout various islands of the Moluccas, among others, Ceram; these pioneers obtained the plants they sought from the kings of Gebi and of Palani, as well as a large number of mature fruits and nuts fit for planting. The vessels escaped the Dutch, who were on the look-out for them, and having rejoined, finally made their way safely back to the Mascarene Islands with their precious freight by June 24, 1770. Again, 1771, Poivre sent M. Provost on board the *Isle de France*, commanded by sub-Lieutenant de Coëtivi, accompanied by the *Nécessaire*, under M. Cordé. These officers went to Gebi, and returned thence successfully with a good cargo of plants and seeds. M. Poivre had purchased an estate named Montplaisir, some little way north of Port Louis, where he formed a garden and nursery for these exotics, which he placed under the direction of M. de Ceré, a worthy continuator of his work. This garden is now

known as the celebrated garden of Pamplemousses. An English traveller, Mr. Mackintosh, writing from Calcutta in 1779, thus describes these gardens:—"The apicerics of Ceylon, Amboyna, and Banda promise to flourish in this island (the Isle of France). In the parish of Pamplemousses, the King of France maintains, at a considerable expense, and in good condition, a spacious botanical garden, divided into four parts, representing the great quarters of the earth, in which the trees, shrubs, plants, flowers, herbs, roots, &c., of each are respectively planted; pieces of wood being fixed in the ground by each, describing its name, native country, and qualities. In this garden, Cinnamon and Cloves thrive amazingly."

produced only a light bark, triflingly unctuous, and very inferior in quality to that of the Moluccas. The Clove trees dwindled, and though the plant itself appeared healthy, its fruit did not answer the expectation of Government. In a word, this business was nothing more, properly speaking, than an object of curiosity; like those Orange trees in Russia, or in the north of Germany, which produce fruit by dint of attention, but the fruit is degenerate, has no taste, no flavour, and scarcely even any smell."

Fortunately for his peace of mind, Poivre did not learn the ultimate failure of his schemes. He left the colony in 1773, soon after his friend Marion had been slaughtered and eaten by the cannibal Maoris in the Bay of Ialanda. When Poivre reached France, he

1818 to Mr. Torrenberg, whose memoir of Pierre Poivre was published. M. A. Boullé also published a memoir of P. Poivre at Lyons in 1825. *S. Pasfield Oliver, Capt., Moray House, Anglesey, Gosport.*

P.S.—On the column erected by M. Liénard in the garden of Pamplemousses, the name of Pierre Poivre occupies an honourable place. In the Jardin National at St. Denis, in the neighbouring island of Réunion, the public benefactor is yet more honoured. A bust of the administrator was placed here on a monument erected by the Count de Chabrol the Colonial Minister, and M. de Freycinet the Governor of the Island in 1825: "A la mémoire de Pierre Poivre, né à Lyon en août, 1719.

FIG. 14.—VICTORIA REGIA HOUSE AT CHATSWORTH. (SEE P. 62.)

Alas! there is another side to this picture. M. de Grandpré, writing in 1789, ten years later, says:—"When the French succeeded in pilfering spices from the Dutch, the plants were conveyed to the Isle of France, and carefully cultivated in the king's garden. A few prosperous years, with skilful and expensive management, gave reason to hope they might be naturalised there, and the Government had even begun to distribute the young plants among the inhabitants, and to teach them how they were to be reared; but the hurricanes soon put an end to so flattering a prospect. The settler grew weary of the expense and extreme care necessary to the support of an object of which the profit, while it was uncertain, was also at least far distant; and the results, even in the king's garden, were by no means so satisfactory as was expected. The Cinnamon

found he was in disgrace at court, and it was not until two years had elapsed that he found M. Turgot assured of his straightforward and zealous policy in the Mascarenea, for his enemies had done their worst to empoison the French minister against the reformer who had done his best to stop the prevailing corruption in the colony he had been sent to administer. Poivre died at his residence, La Freta, on the banks of the Saône, two leagues from Lyons, on January 6, 1786.

The notice of Poivre's life in the *Biographie Universelle* is by M. de Gérando, who has drawn his materials from the account written by M. Dupont de Nemours, which was prefixed to the edition of the *Voyages d'un Philosophe*, published at Paris in 1797. The Academy of Lyons offered a prize for the best eulogium of Poivre, and this was awarded in

Intendant des îles de France et de Bourbon depuis 1767 jusqu'en 1772. Mort le 6 janvier, 1786. Ces îles lui doivent le Giroflor et le Muscadier introduits en 1770 et 1772." *S. P. O.*

SCOTLAND.

BINROCK, DUNDEE.

LIKE other great industrial towns, we expected to find Dundee well environed with suburban seats where gardening was well represented; and judging from the numerous handsome entrances, well-trimmed shrubberies, and choice evergreen trees associated with the residences of the wealthy Dundonians (and it is well known they are not few), horticulture must

have a good share of patronage. The successful exhibitions held at Dundee for a number of years, and the numerous enthusiastic amateurs connected with the horticultural association of that town, also show that an interest in gardening is not lacking. I embraced an opportunity when in the district lately of visiting a few seats of gardening notoriety.

At Binrock, the seat of J. M. Keiller, Esq., I called on purpose to see what the gardener—Mr. Grossart—was doing. His name being much associated with Orchid contests and extensive exhibits of plants at the Royal Caledonian Horticultural Society's shows, one expected to find him engaged with his favourite plants in the gardens. The order and good management in every department indicated that all the gardening at Binrock was alike, and equally favoured, and in course of time—for time as well as skill is necessary in horticulture—more of Mr. Grossart's productions will be seen at exhibitions. Many of the plants in the fine range of glass are, however, still small.

Passing through grounds well furnished with trees and shrubs, the range of houses chiefly set apart for plant culture was reached. Among cool Orchids, *Odontoglossum Pescatorei* and *Alexandra* filled one house. Some fine spikes of *O. Eldorado* were at their best; the flowers were very large and clean. *Miltonia vexillaria* was doing capitally, freely flowering, and the foliage much darker than usual. A fine specimen of *Cymbidium Lowianum* was in fine form, robust and healthy. *Cattleya Lawrenceana* was flowering beautifully, and the plant in fine condition. *Cypripediums* were numerous, and showed great vigour, *C. Stonei* being well represented. Abundance of air is supplied to this structure, and the plants are stood wide apart on the stages. The next division was filled with *Odontoglossum Alexandra*, chiefly *Ceologoyes* (the Chatsworth variety as the best), and *Lælia purpurata*. A fine variety of the latter was flowering very freely. Passing to another structure, which was set apart for *Cattleyas*, *Cymbidium*s, *Dendrobium*s, and *Lælias*, *L. purpurata alba* was observed finely in flower, with some spikes showing six to seven large well-developed flowers, and as many as nine on several of the more robust plants.

The next division contained a collection of *Cypripedium*s, *Angraecum*s, and *Phalaenopsis Schilleriana* stood amongst plants of *Cocos Weddeliana*, and having a pleasing effect. In the next structure a collection of stove plants is grown—Ferns and Palms in fine health, and vigorous plants of *Dracenas*, *Alocasias*, &c., with *Allamandas* hanging from the rafters. In the next division was found a collection of *Crotons*—*Countess*, *Disraeli*, *Warneri*, *Sunrise*, *Sceptre* (with long bright leaves), and others arranged for effect. Bright and beautiful as this grand species appear when in a house by themselves, we prefer seeing other plants with fine foliage associated with the *Crotons*. In another house Melons and Cucumbers are grown. Binrock, a white-flesh fruit; Best of All and Prince Albert Melons being special favourites. The plants were fruiting freely. Tomatos are cultivated on the north side of the structure, and every bit of space was turned to some account. In one division of this range of span-roofed houses, a collection of plants in full flower was noticed, such as *Azalea*, *Pelargonium*, *Calceolaria*, *Spiræas*, *Marguerites* &c.—a gay and attractive display.

This handsome range stands on a terrace, from which fine views are obtained of the river and across to the coast of Fife, but eastward the Taybridge mars the view to some extent. From this point one looked down over the sloping ground, where a number of plants of *Weigela rosea*, bending to the ground with flowers, gave much to admire. Beds of tuberous-rooted *Begonias* nearly in full flower, *Pelargonium*s, &c., were observed; also a span-roofed house full of zonal, French and other *Pelargonium*s, which were making a great show.

In the conservatory, a structure connected with the dwelling, were Palms and other graceful foliaged plants for decorating. Palms were conspicuous for their size and robust health. *Coleus*, of large size,

were used to enhance the beauty of the green foliage—in which they were placed. This conservatory is furnished with an electric light apparatus, which renders it a very useful adjunct to the mansion. There are numerous retreats in the grounds where the river can be viewed at pleasure, while one can be concealed among trees and shrubs, or sheltered from sun and wind by them; rocks covered with Ivy gives one the idea of being far removed from the busy town of Dundee. Some large masses of shrubs are passed, with a somewhat formal rock-garden in front, still remarkably gay with the white *Iberis*, *Saxifrages*, *Sedums*, and other plants found in rock gardens.

Long lines of *Roses*, which had been cut down somewhat by the frost, were starting vigorously from the surface. Teas were numerous, and seemed to have suffered little. A hasty run through the vegetable garden convinced us that careful attention is given in that department, and all crops are doing well. Strawberries on the slopes were most promising, and those under shelter of the rocks were near to the colouring stage, *Black Prince* being the earliest. President is largely grown, and much valued for its certain and abundant cropping. A fine range of fruit-houses is likely to be erected, and there is all one could desire for position and shelter to grow fruit. *M. T.*

COFFEE GROWING IN JAVA.

REPORTING on the finances of Netherlands' India for the year 1893, Sir G. Bonham makes some interesting remarks on the cultivation of coffee in Java, which had been brought out by a Government commission on the subject. Referring to the difficulties a coffee-planter has to contend with, the fact is stated, that, as the coffee plant only comes into bearing in its fourth year, the capital and labour expended are meanwhile unproductive, a state of things rendered particularly unsatisfactory in the case of the native, who is usually entirely destitute of capital or ready money, and consequently has to borrow, if possible. To assist this class, it has for some years been the practice of the government to give special advantages for the growing of intermediate crops, i.e., crops grown between the rows of coffee plants, but this system has again disadvantages. The fact that land suitable for coffee cultivation is no longer to be found in the neighbourhood of the villages causes the crop to be looked upon as an auxiliary one where the cultivator has other resources to depend upon. During the four years that a planter derives no income from his coffee, he devotes his attention to the cultivation of indigenous crops, and ends by regarding these as his principal source of income, the coffee being entirely subsidiary, so that a man may plant as few as fifty trees annually, thus leaving himself ample time to grow other crops. The case of the free coffee farmer is entirely different; he plants not by tens, but by hundreds and thousands. Coffee planting is his principal business, occupying all his time and resources. To work any coffee plantations of importance he must either have large means or good credit to tide him over the four years of waiting for the first full coffee harvest.

PLANT NOTES.

EUCOMIS UNDULATA.

SEVERAL examples of this recently-imported pretty bulbous plant, are at present in flower in McArthur's Nursery, Maida Vale, London. The neat arrangement of its green fleshy leaves adds to its value as an ornamental plant even when it is not in flower; and when it is furnished with dense heads of greenish flowers, it has a strikingly effective appearance. The plant has the further merit of lasting for a long time in bloom, especially in the dwelling, the dry air appearing to suit it. In the greenhouse, cool conservatory, or indoors, it is a useful and interesting plant. The plant is figured in the *Botanical Magazine*, 1083.

THE WEEK'S WORK.

THE ORCHID HOUSES.

By W. HOLMES, Gardener, Pickering Lodge, Tinperley.

SUMMER-FLOWERING CATTLEYSAS AND LÆLIAS.
—Plants which are expected to blossom during August, viz., *C. granulosa*, *C. g. var. Schofieldiana*, *C. Eldorado*, *C. E. Wallisii*, *C. superba*, *C. calumata*, garden hybrid; *Lælia elegans* in its different types should now either be in or about to flower, and most of the *Cattleyas* and *Lælias* are three weeks earlier than usual in flowering this season, so that plants which usually open their blossoms in August are opening their first flowers. The plants should be well supplied with water, that their pseudobulbs may keep in a plump state during flowering. After bloom is passed, the plants may be gradually dried off and placed in a dryer and airier house. *Cattleya superba* is rather difficult to grow, as a rule, I find it to do better when grown in the heat and moisture of the *Deodrohium*-house, and fastened in shallow teakwood baskets, which I hang close up to the roof; in this position it gets the spray from the syringe. The growths that I get in this way on the plants produce seven and eight grand flowers on a spike. After flowering, the plant needs to be kept moderately dry. The effort of flowering seems to exhaust the plant, as I do not often find them to make a second growth the same season. *Lælia elegans*, *L. e. alba*, *L. e. Turneri*, the last-named still one of the very finest varieties, *L. elegans*, and *L. Morreniana*, another very dark-flowered variety in the way of *L. Turneri*, do better when grown in shallow baskets than in pots hung close up to the roof. *C. Eldorado* and its white form, *Wallisii*, do best when planted in shallow baskets, or fixed on teak rafts hung near the glass. *Cattleya Victoria Regina*, which is nothing more, in my opinion, than a variety of *C. amethystoglossa*, and *C. Alexandra*, should be making growth, and will need to be kept thoroughly moist; they will flower towards the end of next month. *Cattleya Harrisonii* and *C. Loddigesii*, which have nearly completed growth, and the flower-spikes are ascending the sheaths, must be kept in a growing state till flowering is over, when they ought to have water gradually withheld. The plants of *Cattleya citrina* grown in the Mexican-house are starting new growths, which it is necessary to encourage, and growing on as they are, on wooden rafts, they soon get dry, and there is no danger of affording too much water. My plants get daily syringing, like the other plants in this house.

THE HARDY FRUIT GARDEN.

By T. TURTON, Gardener, Maiden Erlegh, Reading.

NUTS.—To avoid risk of loss of Walnuts from the drought, the roots of the trees should receive a heavy watering, and if growing on arable land, a thick mulching of litter. This, as well as the watering, should extend as far as the extremities of the branches. On grass, a covering of lawn-mowings, or other short grass-mowings, would prevent moisture from escaping, and would not injure the sward. The same remarks apply to Cobs and Filberts, the quantity of water afforded being according to the nature of the soil, whether stiff and holding, or light and porous. Filberts form such a valuable addition to the dessert during the winter, that no amount of trouble should be avoided to bring the crop to the highest perfection; and, commercially, it is one of the best paying crops.

PEARS.—Tie-in all young shoots required for extending the trees, and thin off over-abundant fruits as soon as possible. In the absence of heavy rains, moisten the soil about the roots once a week; and where such is afforded, nothing could be more favourable for choice varieties than the present hot weather. It is owing to this fine weather, and abundant root-moisture, that I attribute the absence of spotted or cracked fruits in this garden. Glou Morcean, Winter Nelis, Bergamotte d'Esperey, and other sorts which ripen well only in favourable localities and seasons, are likely to be excellent this year. Where trees on walls are much besmirched by honeydew, remove the foliage worst affected by hand, as when it is left on the trees it forms a harbour for earwigs and other injurious insects. Syringe the Pear-trees thus affected with strong soap-suds, and before the same has had time to dry on the leaves, syringe it off again with clean water. Old Pear-trees against buildings, bearing good crops of fruit, will require different treatment from those

which grow on the walls of the garden, the whereabouts of the feeding-roots not being easily ascertainable; and if the soil is gravelly, it should be broken up over a good space, and watered several times with clean water until it is thoroughly moist, when liquid-manure in quantity may be poured over it.

RIPE FRUITS.—Directly wasps, hornets, flies, &c., begin to attack Apricots, Plums, and other ripe fruits, means should be taken to trap them; and nothing answers better than a trap made by placing one hand-light on the top of another, the bottom light to be placed on bricks at the corners, and baited with blemished fruit or treacle. A small hole is made in the cover of the bottom light, to admit of the insects crawling into the upper light, the space between the two lights being packed with paper and covered with soil.

THE KITCHEN GARDEN.

By H. C. PRINSEP, Gardener, Buxted Park, Uckfield.

RIDGE CUCUMBERS.—Where these are grown, special attention is needed, aphides being troublesome at this season. To clean the plants, syringe them with a weak infusion of soft-soap, repeating this every evening till the plants are freed from them. In windy places it is prudent to peg down the leading shoots to the bed or surrounding soil. Afford water before the plants get dry at the root, and occasionally liquid manure, and in the event of heavy rain, place lights over them, or otherwise prevent the ground becoming very wet.

CELERY.—This will need at the present time much care, watering being done frequently and thoroughly. The quicker is the growth of Celery, the tenderer it is. The application of liquid manure at this season, provided it is of a mild nature, is a very useful aid to growth. Failing this, sprinkle the sides of the rows with guano, and wash it into the trenches. Attend to the earthing-up of the earliest crops as fast as it is safe so to do, or after affording water at some distance from the plants, soaking the land on either side.

FRENCH BEANS, &C.—These and Scarlet Runners will now require abundance of water at the roots. Another sowing of the first should be made in a warm position. Stake all Runner Beans before the plants get tall, and the bine entangled.

ONIONS.—Where the Onion-maggot gives trouble, it will be advisable to make a sowing of some Onion of the White Spanish type, as these stand the winter well if sown thus early, and transplanted early in the month of September, or they may be sown at the end of this month where they are intended to stand. Maggots seldom attack these Onions, as by the time that the first flies are hatched, the plants have got strong enough to resist the attack. I have grown good bulbs from seed sown and treated in this manner, which have kept good till Christmas.

VEGETABLE MARROWS.—If water has been plentifully supplied to these plants, there will be no lack of fruit, the plants having this year grown and set their flowers freely. Remove the Marrows as soon as large enough, thereby economising the vigour of the plants. For aphids, treat as recommended for ridge Cucumbers.

GENERAL WORK.—Much time has of late been taken up with watering crops, and Beetroot, Carrots, Parsnips, and Onions, which were not sown very early have suffered and are wanting in size, owing to the lack of moisture, but where the ground is in good heart they will soon begin to grow after rain. Keep the hoe at work amongst all crops, to check weeds and move the surface.

THE FLOWER GARDEN.

By T. H. CHASE.

CARNATIONS AND PINKS.—The layering of the former should begin with the wane of the bloom, and this is usually carried out whether the plants are growing in the border, in beds, or in pots. Before commencing to layer, a compost of leaf-mould, loam, and sharp sand, in about equal proportions, should be prepared, in which to root the layers; and pegs cut, which may either be got from stout Bracken stems, or worn-out birch-branches. Let the soil around each plant be carefully stirred with a small hand-fork, and a quantity of the compost some 2 inches thick placed about

them so far as the shoots will extend when layered. The shoots to be rooted should be denuded of a few of their lower leaves, and notched with a slit an inch long in an upward direction, made from a point just through or below a joint, and at that part of the stem that has acquired some degree of firmness. The tongue thus formed should be gently pressed into the compost, and secured by a peg. When this is done, a little more of the compost should be put round the layer to the depth of about 1 inch. The plants should receive a good watering after the job is performed, and in dry weather occasional waterings, taking care that the shoots are not denuded of soil thereby. Propagations by means of pipings is generally adopted, if the shoots are too short or numerous for layering, or when broken by wind, &c., and it is preferable to take the cuttings first. The best and surest way is to make a mild hotbed, and put on it 4 or 5 inches of fine soil, covered with silver-sand. The pipings should be taken off with a heel, or cut off at a joint, and must be long enough to have a piece of firm wood at the end. Insert them firmly in the soil, afterwards watering and keeping them close and lightly shaded, but not too moist, or damp will carry off numbers of them.

ROSES.—With the rains of last week the bark will soon "run," and when that is ensured, budding should commence. It is important to place the buds on the young shoots as near the base of these shoots as possible, and a little more binding material should be given this year in case of hot, dry weather ensuing [or grafting-wax used. Ed.]. Roses of all kinds may be readily propagated at this season by cuttings, choosing the stiff, moderately-matured young side-shoots with a heel, and inserting them in sandy soil under hand-lights or in pots, placing them in moist, closely-shaded, cold frames, or on mild hot beds. It is prudent to reduce the leaves in size, by taking off the eod leaflets, and a leaf or two may be left at the base of the cutting—it favours rooting. Grafted Roses, especially those on the Manetti stock, should have the root suckers removed, or they will rob the plants of vigour, and eventually the scion will perish. Lawns that are browned with sun and dry weather should be cut over frequently, to remove bents. The showery weather will permit the sowing of grass seeds, forcing these into the soil by sweeping and sprinkling finely-sifted loamy soil over it, followed with rolling.

FRUITS UNDER GLASS.

By M. TEMPLE, Gardener, Carron House, Falkirk, N.E.

VINES.—If Vines are grown in pots for supplying early Grapes next spring, the canes should be thoroughly ripened, otherwise fine fruit will be looked for in vain. To secure this end, abundance of air must be afforded, the pipes being kept warm during damp weather, no laterals allowed to grow; and the glass kept clean, so as to benefit to the full from the sunshine. In the matter of watering there should be no stint, but the soil should not be watered till it is becoming dry. It is a good practice to let the rods hang downwards on the back-wall of a narrow house, which may be done by raising the pots to the desired height, to induce thorough ripening. This is a practice that is followed by one of the most successful English Grape-growers in pots, but who never lets the roots or the foliage suffer. It is a great mistake to cause Vines to shed their leaves by suddenly submitting them to full exposure after they have been kept for months in a close, moist, and warm atmosphere. To get late Grapes, such as Mrs. Pince, Black Alicante, and Lady Downes' to ripen early, the Vines need great attention. I am as strongly inclined as ever to advise early ripening of the canes, and abundance of air, with the hot-water pipes kept warm for weeks to come after the Grapes are fully-coloured. By the end of September the fruit should be ripe and sugary. It was remarked that those thus treated here last season are as yet (July 5) showing no symptoms of shrivelling.

FIGS.—The trees carrying the second crop of fruit now swelling, should have as liberal treatment as when the first crop was growing, the shoots kept thin, those not required removed, and gross ones stopped. Trees whose roots are not confined, and with shoots so gross that they are certain to be unfruitful, should have a portion of the roots on one side, and those that have a downward tendency, cut off above the level of the drainage, the whole being made firm about the roots, with good soil. Later in the season these unfruitful trees may have the rest

of the roots partially cut away with a knife. The primary object in early root-pruning is to get the new root-fibres ramifying in the soil before the leaves fall—fruitfulness is then almost certain. That, in fact, is my experience, and I have practised it on many kinds of fruit; but the cutting off of roots is never practised when lifting will suffice.

STRAWBERRIES.—Runners for forcing which have to be lifted from the ground should be taken up with all possible care, potted firmly, and kept in the shade till growth is active, when they may then be placed in full sun. In northern counties, growth may be hastened by placing plants in a frame that is kept close and shaded at first, and fully exposing the plants when they are able to stand sun and air. Those potted in the usual way will require abundance of water, and the whole space on which the pots are placed watered freely in the evenings of hot days; rain-water or pond-water is best, and well-water the worst.

PLANTS AND THEIR CULTURE.

By E. WADDS, Gardener, Birdsall Manor, York.

BALSAMS, COCKSCOMBS, AND EGG PLANTS.—These plants are benefited by frequent syringing, liquid manure, and abundant ventilation. They should never be grown far from the glass, but always as close to it as is prudent, lowering them as they increase in stature.

CALCEOLARIAS.—Sow seeds in a well-drained pan of sifted loam, leaf-mould, and sharp sand, watering the pan gently before sowing the seeds, and sow thinly, pressing the seed into the surface, and do not cover it with soil, but tie a piece of paper over the pan, and keep it moist till the seeds have germinated, when the paper must be removed, and the pan placed in a handlight at the north side of a wall out-of-doors.

MIGNONETTE for winter flowering should now be sown, using 6-inch pots, well-crooked, and filled, first with lumpy turf and dry cow-dung on top of the crocks, and then with finer loam, leaf-mould, and sea-sand, well mixed together, leaving space for water. Water the pots thoroughly when prepared, and sow thinly, covering the seed with some finely-sifted mould. Stand the pots in a shady place, and cover them with a piece of netting or tiffany till the seeds are up. Thin out the plants as soon as they are ready to handle. The best varieties for pots are Miles' Spiral, Queen Victoria, Machel, Garaway's White, and Giant Crimson.

CYCLAMEN PERSICUM.—Seeds should be sown as soon as possible after the seed is ripe, using a good kind of loam, leaf-mould, and plenty of sand, and pots or pans that are well drained. In this case the soil should be watered before the seeds are sown on it, and be covered with a quarter of an inch of finely-sifted soil. Cover as before with paper, but keeping the seed-pots in a temperature of about 60°. The seeds are large, and may be watered with a fine-rose pot at times.

STEPHANOTIS FLORIBUNDA.—Regulate and thoroughly clean the shoots of those plants that have done flowering. Give good supplies of liquid-manure, and let the shoots grow freely, but do not let them twine round each other; and where there is brown scale, the foliage and stems will require careful sponging or rubbing between the finger and thumb to remove them.

IXORAS.—Maintain a moist growing temperature and afford frequent watering and copious syringing to plants making growth, with shade during bright weather. Those coming into flower will require plenty of air on favourable occasions, and not much shade; those out of bloom will be better in a cooler temperature, with plenty of light and air, and not too much water at the root, but they should not be allowed to get dry at any time.

GARDENIAS AND TABERNÆMONTANAS need abundance of water and a moist-growing temperature. When the plants are kept in 8 or 10-inch pots, plunge these into liquid manure at times the same strength as you water with; it will lift them on considerably if they stand in the water for five minutes.

PERGULARIA ODORATISSIMA.—Give abundance of clear soft-water and manure to this beautiful sweet climber; it wants growing in abundance of heat and moisture.

EDITORIAL NOTICES.

ILLUSTRATIONS.—Photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c., are particularly solicited; but the Editor cannot be responsible for loss or injury.

NEWSPAPERS.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Advertisements should be sent to the PUBLISHER.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—63°·4.

The Chiswick Show.

TIMES have changed, and not only have we changed with them, but our predecessors, who had often to chronicle the glories of Chiswick, have mostly undergone the great change which is beyond chronicling. It was impossible to shun some such reflections, trite though they were, at the recent show at Chiswick. With the aid—or mostly without it, as it proved—of the residents interested in horticulture, an attempt was made to organise a "show" at Chiswick this week. The weather proved, for once at a Chiswick show, highly favourable; but the show—well, it was not essentially bad, it was in some respects good, but it was unworthy the old reputation of Chiswick, and was a falling-off from the "Congresses" which have been held in the historic gardens of quite late years. Those Conferences, we fear, were, from a financial point of view, failures, and we suppose they did not attract the local residents in such numbers even as came to the gardens on Tuesday last. In the morning of that day, when special facilities were given to Fellows and subscribers, the attendance was indeed small, but the attractions of the band and of the estimable lady who distributed the prizes (but who, by the way, has no sort of connection that we know of with horticulture), sufficed, we are told, to secure a larger attendance in the afternoon.

These circumstances seem to show that, for the local residents, contrary to what is the case in the neighbouring parishes of Richmond or Ealing, horticulture has no particular attractions. We do not suppose it had much more in the "palmy" days of Chiswick—whenever they may have been, but then it was the fashion to go to Chiswick, and then the shows were clearly vastly better than the one held on Tuesday, and the gardens were much more completely representative of progressive horticulture than they are now. It would scarcely be possible to revive the Chiswick shows, such as they used to be, nor do we think, in the interests of horticulture, it would be desirable if it were possible. We should be sorry indeed, to see the Royal Horticultural Society become a donkey-decorating, carriage-adorning institution. Catering merely for fashionable folk is not only unworthy of a

chartered society, but, as was fully exemplified at South Kensington, it was financially disastrous.

The Congresses or Conferences to which we have referred, if they, in their turn, were unsuccessful as sources of revenue, were at least highly useful to horticulture, and excited the greatest interest among horticulturists. We may cite, as cases in point, the Apple Congresses, the Vegetable Congress, the Conifer Congress, those devoted to Chrysanthemums, to Roses, to Dahlias, to Begonias, to Asters, to mention only those which were held at Chiswick. The Treasurer, no doubt, did not view these gatherings with much favour, but the working Fellows of the Society appreciated them greatly, and the records of their proceedings in the *Journal* of the Society have been largely instrumental in lifting the Society out of the slough into which it had fallen, and are a permanent tribute to the importance of the Society.

By way of contrast we may ask what effect will last Tuesday's meeting have upon the Society? Little or none that is advantageous, we fear. The gardens were suffering, as most gardens are, from the prolonged drought and excessive heat; but, putting that aside, there was little to attract the casual visitor, and no attempt had been made to interest him in the work of the garden or to make clear to him what the purpose of the garden really is.

Remembering, as we do, the frightful dilapidation and decadence that ensued at Chiswick during the evil days—now, we hope, things of the past—we can see great evidence of improvement and renovation; but the ordinary Fellow of the Society, or the casual visitor desirous of realising the present state of horticulture, of seeing for himself the most perfect keeping, the most correct nomenclature, the most serviceable style of labelling, the best and most improved methods of procedure in various departments, the best and most suitable varieties of particular plants, the best means of combating insect or fungus pests, the most varied methods of garden decoration and "bedding," or the most practically interesting experiments, will, we fear, come away from the old garden with a feeling of disappointment. He will not know all the circumstances and all the drawbacks; he will look only to what he sees before him. It will be unfair, no doubt; but he will judge by results, and the finest band in the metropolis will hardly serve as a substitute for what he thinks he has a right to see—a model garden.

In the case of hospitals it is found that nothing tends so powerfully to keep up a high standard of efficiency as a school of medicine attached to them. When we get our School of Horticulture we may look for further improvements at Chiswick—but in the meantime, much may be done in the directions indicated.

BEGONIA GLOIRE DE SCEAUX.—The plant under the above name is an excellent winter-flowering variety, with flowers of a deep rose colour, the trusses of which show up well against the chocolate-brown and bronzy-tinted foliage. It is of easy cultivation, and cuttings struck in early summer can, under good culture, be made to flower freely the following winter. It is a bright-looking Begonia, and the flowering season extends over a considerable period. The plant from which our engraving was made was one of a large group shown by Mr. Jennings, gr. to Mr. Leopold de Rothschild, Ascott, at the meeting of the Royal Horticultural Society, on January 17, this year. These plants were growing in 6-inch pots, and had a height of 18 inches. As a decorative subject it would be hard to excel.

THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.—On the occasion of the recent Bath Rose Show, a large tent and the lawn around it was set apart by the Management Committee for the use of members and friends of the above Institution, who were invited at 5 o'clock to hear an address from Mr. H. J. VEITCH in support of the claims the Institution has upon gardeners. R. B. CATER, Esq., a prominent member of the Bath and Floral Fête and Band Committee, and a staunch supporter of horticulture about Bath, presided, being supported by Mr. H. J. VEITCH, Mr. INGRAM (Secretary of the Gardeners' Royal Benevolent Institution), Mr. WILLIAM A. GARAWAY (of the firm of JAMES GARAWAY & Co.), Mr. B. R. F. PEARSON, Mr. W. W. JEFFREY, &c. Among a large number of gardeners present were Mr. BETHEL, formerly of Ashton Court Gardens, and Mr. W. H. WARD. Mr. VEITCH, who was very cordially received, made a forcible and eloquent appeal to gardeners and the owners of gardens in support of the funds of this excellent Institution, pointing out what a capital investment it was for gardeners paying a life subscription of £10 10s., or an annual subscription of 1 guinea (4s. 6d. per week). Mr. INGRAM and other gentlemen spoke in support of the appeal made by Mr. VEITCH.

NATIONAL CHRYSANTHEMUM SOCIETY.—We are deaired by Mr. R. DEAN (Hon. Sec.) to inform our readers that a special meeting of the General Committee and also of the Floral Committee will take place at the Royal Aquarium, Westminster, on Friday, July 21, at 6 o'clock in the evening, to examine some frozen blooms of Chrysanthemums sent from Sydney, and for other business. Members of the Society not being members of the General or Floral Committees are invited to attend at 7 o'clock, to inspect the frozen blooms.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT SOCIETY.—The quarterly meeting of this society was held on Monday evening last at the Caledonian Hotel, Mr. LATHAM COLE occupying the Chair. Three new members were elected, making a total of thirty-five in the six months. The death of a non-paying member occurred in May last, and the amount standing to his credit (£24 7s. 4d.) was paid to his widow. The late member ceased to contribute in 1886. One member only is on the sick fund at the present time, thus showing the health of the members to be good. The Treasurer reported having invested £200 in West Bromwich 3 per cent. Stock since the last meeting. The usual Vote of Thanks to the Chairman terminated the proceedings.

A HORTICULTURAL ASSOCIATION FOR THE TOWN OF DERBY.—We are gratified to note a step in the right direction has been taken at Derby, in the starting of a horticultural association. A well-attended meeting was held in the Curzon Street Schools on Tuesday evening, July 4, at which it was decided to form an association, under the above name, for residents in Derby, having the following objects: To obtain instruction in the best and most profitable methods of cultivating fruit, flowers, and vegetables, and of storing and packing fruit; to encourage the tasteful arrangement and successful cultivation of gardens; to promote the extension of window gardening; to secure the teaching of gardening as a "special subject" in schools; to assist in procuring practical training for gardeners, by means of which they may qualify for certificates of efficiency; to further the acquisition of ground for allotments under the Allotments Act, or by other means; to obtain fruit trees, plants, seeds, &c., for members on the most advantageous terms; and generally to advance and protect the interests of the members. A large number of gardeners of the district were enrolled as members, and it is confidently hoped that the number will be very considerably augmented. Mr. W. G. WHEELDON was unanimously elected President; Mr. R. Y. DAWBARN, Treasurer; and the Joint-Secretaries, Messrs. CHANNON and WELBOURN. Joint-Secretaries' address, 6, Shelton Terrace. A representative workers committee of sixteen members was also appointed.

THE DECORATIONS AT WOLFERTON STATION.—The floral and other decorations that were carried out by the Great Eastern Railway on the occasion of the recent Royal wedding were very extensive and complete. The platform reserved for royalty was covered with crimson cloth, upon which were placed by Mr. T. JANNOC, of the Lily Nurseries, Dersingham, who had the entire charge of the floral decorations, three large groups of plants; and over the portico was another one of foliage and flowers. The front of the building and the verandah were likewise profusely adorned with flowers and

GLOUCESTERSHIRE ROSE SOCIETY.—This Society's sixth annual exhibition was held at the Corn Exchange on Tuesday, the 4th inst. Owing to the heat and drought the show was about half its usual size, while the quality, though fairly good, was not up to the high average of previous years. North-country exhibitors did well, and Messrs. HARKNESS & SONS of Bedale took no fewer than five 1sts, besides other prizes. Messrs. JEFFRIES & SON of Cirencester gained a 1st for twenty-four varieties in the nurserymen's classes. The most successful amateur in the open classes was Mr. H. V. MACHIN

to M. F. Desbois—a cutting made in March, bearing a fine truss of bloom, the entire plant about 13 inches high; *Oncidium crispum* Trianaei, to MM. Edw. Vervae et Cie.—large brown flowers tinged with rose; *Cypripedium Harrisianum robustum*, to M. Ch. Vuylsteke—a hybrid between *Harrisianum* and *Hookeri*, remarkable for the size of the flowers, the lip being very upright and spreading; *Cattleya guttata* Leopoldi, to M. A. Van Imshoot—lip dark violet, divisions dark brown spotted with black; *Grammatophyllum Ellisii* (*à l'unanimité*), to M. A. Van Imshoot—very large stem, with twenty-five flowers, yellow spotted with brown; *Odontoglossum elegantissimum*, to Jules Hye—long cluster, with a hundred small flowers, yellow spotted with brown; *Cattleya Mendeli virginalis*, to M. H. Schmitz—flower nearly white, slightly tinged with rose, lip with a touch of yellow; *Nicotiana colossea albo-marginata*, to M. F. Desbois—a pretty novelty, much noticed at the last Quinquennial Exhibition. A lot of 100 cent Pinks, from M. Gnequier, were very remarkable, and comprised the best varieties. Certificates of Flowering: *Dracena* (*Aletris*) *grandis*, to MM. Elm. Vervae et Cie.—plant flowering wonderfully, remarkable for its dwarf habit, about 29 inches, leaves green, undulated, coriaceous, large cluster of 500 small green flowers with white stamens, fecundation is proposed with *Aletris Massangeana*, *Lindeni*, &c.; *Oncidium macranthum hastiferum*, to M. A. Van Imshoot, with more than a hundred large yellow flowers on a very long raceme trained in a hoop on galvanised wire; *Odontoglossum vexillarium* (*à l'unanimité*), to M. Jules Hye—a very fine variety with more than a hundred flowers.

A CEMENT HOUSE.—We have just seen at MM. DESMET FRÈRES, at Ledeborg, Ghent, a house built entirely in cement—walls, framework, and sashes all cement, and the only other materials used are glass and lead, the latter to hold the panes. The walls are double, and there is a space between them which can be filled with sawdust. The building was erected by M. PICHA, who has constructed capital cement water-tanks for various Belgian horticulturists. And what is the advantage of this innovation? How will the building answer in winter? This the future will tell us, and we will report to the readers of the *Gardeners' Chronicle*. *Ch. de B.*

HEREFORD ROSE SHOW.—The twenty-seventh annual exhibition, under the auspices of the Hereford and West of England Rose Society, took place in the Castle Green at Hereford on Wednesday, July 5. The show, like all others this year, says the *Birmingham Daily Post*, was much smaller than usual, but, nevertheless, considering the season, it was on the whole a very creditable display. Several of the chief prizes went to the North, many of the best known local growers, on account of the drought, having to be contented with 2nd and 3rd places. In the nurserymen's division, Messrs. Harkness & Son carried off the palm for a splendid box of seventy-two blooms; and in the class for thirty-six, Messrs. Mack & Son secured premier honours. The Gold Medal, offered by the National Rose Society for eighteen blooms, was carried off by a local exhibitor, Mr. John Ough; and the Silver Medals fell to Mr. A. Whittton, Sir G. George Cornwall, and Mr. Drew. The other prize-takers included the English Fruit and Rose Company, Rev. M. Marshall, Mr. C. Whiting, Mr. C. Jones, Miss Bulmer, Mrs. Woodhouse, Mr. J. Rankin, M.P., Messrs. Merryweather, Mrs. Davenport, Mrs. Watkins, Rev. A. C. Lee, Mrs. Blashill, Miss Stanhope, Miss Barneby, and Miss E. Crichton. At the luncheon the Mayor of Hereford (Mr. J. R. Symonds) presided.

KINGSTON, RICHMOND, AND DISTRICT GARDENERS' OUTING.—On Wednesday, the 5th inst., about thirty members of the Richmond and District Horticultural Society visited Messrs. SUTTON'S establishment, nurseries and trial grounds, at Reading. A most interesting morning was spent, the *Gloxinias* and *Begonias* being greatly admired. In the afternoon a cricket match had been arranged with the

FIG. 15.—*BEGONIA GLOIRE DE SCEAUX*: GROWN AT ASCOTT. (SEE P. 66)

foliage, as were the royal waiting-rooms. It may be noted as a remarkable feat in gardening, that 3000 blooms of forced Lily of the Valley were used in the decorations, and in addition, Mr. JANNOC sent enormous supplies to all the Court florists in London during the week. The decorations were not confined to the station, but extended to the carriage-portico and drive; and on the brow of the hill, near the railway-station, the inhabitants of Wolferton erected a fine triumphal arch of evergreens, white Roses, &c. The extraordinarily large use made of Lily of the Valley has by no means exhausted the stock of these flowers at Dersingham, as many thousands are at the present time in all stages of development.

of Worksop, who carried off five 1sts. In the local classes, Mr. CONWAY JONES of Gloucester achieved the greatest success, he being credited with two 1sts, the Gold Medal presented by the Society for the best box of eighteen varieties exhibited by a Gloucestershire amateur, and the Silver Medal presented by Messrs. JEFFRIES for the best box of Tea or Noisettes exhibited by a Gloucestershire amateur.

JULY HORTICULTURAL MEETING AT GHENT.

—Certificates of Merit were awarded to the following plants:—*Strobilanthes Dyerianus*, to MM. F. Deabois and Louis Desmet-Duvivier—a beautiful novelty shown at the Ghent Quinquennial by Messrs. Sander & Co.; *Hydrangea otaxa compacta*,

Society's C. C. and the first eleven of SUTTON'S C. C. A pleasant game was enjoyed, in which the latter club were victorious.

EXCURSION.—The employes of Messrs. LAIRD & SINCLAIR, Nurserymen and Seedsmen, Dundee, Monifieth, and Monikie, held their annual pic-nic on Wednesday, July 5, the place chosen being Auchmithie. The party drove in brakes by way of Arbroath, Auchmithie being reached after a pleasant drive.

PRESENTATION.—In the Crown Hotel, Dundee, on Monday, July 10, Mr. ENGLIS, cashier to Messrs. LAIRD & SINCLAIR, Nurserymen and Seedsmen, Dundee and Monifieth, was presented on the occasion of his marriage, by his fellow-workers with a silver dessert-stand.

HOME CORRESPONDENCE.

PEAR BEURRÉ GIFFARD, ETC.—Many years ago I planted this fine Pear on a south wall to come in just before the Jargonelle, and very acceptable its fine handsome, juicy fruits always are, generally ripening the first or second week in August; but, to my great surprise, I gathered the first ripe fruit this year on July 4. Hitherto, Doyenné d'Été, foremost of the flock, and several others came in before it, but this year, a tropical sun, and only 1 inch of rain for one hundred days, have altered the whole course of things, and I was enabled to gather Waterloo Peach on the wall at the same time and place as the Pear. The Black Currant Champion has behaved splendidly, and produced fine large full-flavoured fruit this season. *J. Rust, Eridge Castle.*

DOG AND CAMPANULA.—In my garden I have a large number of plants of Campanula rapunculoides, and one of my dogs, an old fox-terrier, has a taste for eating them. The dog does not confine itself to the leaves, but pulls the plants out, and eats stems, leaves, buds, and flowers, with gusto. Le Maout and Decaisne in their *Descriptive Botany*, say that many species of Campanula are considered to cure hydrophobia in Russia. Possibly this curious belief has arisen from the fact that Russian dogs have been seen to eat Campanulas, but I have never myself noticed it in any other dog than my fox-terrier. The dog eats the plants when in perfect health. *W. G. S., Dunstable.*

OLD PEACH TREES AT ABERCAIRNY.—Your correspondents, pp. 722 and 749 in previous volume, afforded interesting information regarding the age of some Peach trees. I am able to supply further information concerning the age to which the Peach will attain. At this place is one of the first, if not the first, orchard-house erected in the country (in 1807). Two large houses, 17 feet high at the back, form the middle portion of a range of fruit-houses, and one of these has been used as an orchard-house since 1808, Peach trees being planted as standards in front of the pathway. When I took charge of the gardens, forty years ago, three of the original trees were then growing in this house. An Early Anne failed twenty years ago, and was followed eighteen years later by a Red Magdalene Peach. The remaining tree, a Red Magdalene, is showing signs this season of failing vigour. All these long years, these trees have borne regularly and heavily, and the fruits have many a time graced an exhibition table. Although the house has been rebuilt, the only remaining tree grows where it was first planted, and up to the present season I have observed no difference in its appearance. I may mention that the original trees were planted by Mr. McIntosh, father of Mr. C. McIntosh, author of *The Book of the Garden*, &c., both father and son having been head gardeners at Abercairny. *James Brown, Abercairny, Crieff, Perthshire.*

THE VICTORIA REGIA.—Has "W. W." never been to Chatsworth? or has he never read of the famous Victoria Regia-house there, where the plant has been successfully grown annually for upwards of fifty years? To Chatsworth also belongs the honour of first flowering this noble plant, somewhere, I think, about 1840. This first flower was sent by Mr. J. Paxton to the Queen, and it was then that the genus received its title of Victoria. *O. Thomas, The Royal Gardens.*

—As one who had charge daily of a well-known "Victoria-house" for years, I venture to say that some portions of the description of the plant given by "W. W.," p. 31, are incorrect, as for example, when he states that to protect the upper surface of the leaf, "the margin is turned up all round, forming a rim several inches high, the outside of which presents a spine-clothed barrier to any animals which might otherwise land on the leaf." I believe all growers of the Victoria will bear me out when I state that the edges of the leaves are turned up only while they are young and growing, and unfolding. When they cease to expand, the edges roll out and lie perfectly flat on the water. As to the perforations of the leaf, I never saw any not caused by accident or decay of spots; but, I never looked with a microscope. I have spilled gallons of water on the leaves to swirl dust and objects from off them, and it soon ran off at the flat edges, and evaporation did the rest. I doubt also if the stalk elongates "long after the blade has matured." I have floated a little girl over the tank stood on a board on a leaf over 6 feet in diameter; but, a family of three would have been wrecked. *Vic.*

LUISIA.—We read with surprise the article concerning *Luisia Amesiana* in the *Gardeners' Chronicle* for July 8, in which it is stated to have just flowered for the first time in England. This variety was introduced by us some two or three years since, and was named by us in honour of Mr. F. L. Ames, and the same season we bloomed two, if not three, plants. *Hugh Low & Co.*

THE DECORATIONS AT BUCKINGHAM PALACE.—An error has crept into your description of the floral decorations at Buckingham Palace, on the occasion of the recent royal marriage, at p. 39 of your last week's issue, where you state that the whole of some were entrusted to Messrs. Wills & Segar, of Onslow Crescent. We are florists to the Queen by Royal Warrant, and have supplied floral decorations and bouquets at all the State concerts and balls, &c., which have taken place at Buckingham Palace since 1869. We are the successors to the old firms of royal florists, Messrs. Little, Tuck, and Catleugh, all of Chelsea (but now extinct), and for some years past the floral decorations there have been equally divided. Thus, this morning we have supplied a large number of fine Palms and decorative plants, together with a number of bouquets for the State ball; whereas our portion for the royal wedding on Thursday last was all the floral work in connection with the grand staircase, the Marble Hall, the Round Library, and the choice vase-plants for the royal tables. *J. W. Wimsell & Sons, July 11.* [We regret we were not informed on this point. Ed.]

SUMMER-PRUNING.—The question in dispute, may be stated in a nutshell, thus:—Does or does not summer-pruning augment or accelerate fertility? So far as a body of testimony that has been accumulating in volume and force for at least a quarter of a century can establish anything, the benefits of summer-pruning are beyond dispute. The case in favour of summer-pruning is altogether too strong to be affected by a few isolated cases on the other side, which the most zealous summer-pruner has never doubted the existence of, or denied. In fact, summer-pruners, whatever their methods or their views about surplus, or gourmand, or relay shoots, are perfectly familiar with unpinched forms of growth fruitful from base to summit, and I will give your correspondents a free run as to their length. As you truly remark in your Leader for June 3, p. 662 (in which you do scant justice to the early history and practice of summer-pruning, and the genius of its founder, the late Mr. Thos. Rivers, my first teacher in the art), we got fine crops before the days of orchard-houses and the dwarfing of stocks, and, I would add, summer-pruning. No doubt, give Nature a free head, time, space *ad libitum*, controlled by skill, she will by some means, and at some time, reach her final goal—fertility. Those who can wait are welcome to extend their trees, and build fruit-rooms for their future produce at their leisure, for we gladly admit that on a unpinched tree the ratio of bud-production increases every year, but does it not also do likewise on pinched or summer-pruned trees, though we also admit that at an early age the unpinched will completely outstrip the pinched tree in the ratio of mere buds, that is, chiefly wood-bud production. This is, in fact, a mere mechanical truism. Leave a tree intact, it will have more buds than another tree a part of which

has been suppressed or cut away, inasmuch as the whole must needs be greater than a part. But the vital question in dispute is, will the pinched or summer-pruned trees have more fruit-buds in a given area than the unpruned ones? And this question cannot be settled through plussing the power of bud production with the area of the trees. Were this once admitted, then the matter might be formally stated and settled thus: the larger the fruit tree, and the further and faster it grows the more fruit, and *vice versa*. Are "Extension," "E. M.," and others prepared to go so far? If so, it would simplify matters much, and if not, why should they run their heads against summer-pruning? The two systems are not necessarily antagonistic, and why then waste time and force in pitting one against the other, as if this one were always and everywhere absolutely right, and the other wrong! To read some writers, one might imagine that gardens and orchards were suffering from a plethora of treatment, or heroic surgical operations, covering all the ground, and giving the trees a restless time of it, between rival methods of culture and treatment. Hence, apparently, some correspondents cannot briefly and clearly describe their own methods without falling foul of those of others. In reality, our fruit trees are suffering grievous loss, or perishing from sheer neglect. The lack of any and all treatment—inertia—reigns supreme over dirt, over-crowding, and semi-starvation. The first difficulty is to get something done. And besides this unwisdom of horticultural doctors, airing their differences so widely before their patients, there is work enough for all our energies in the planting of new fruit-gardens and orchards, and the resuscitation of old ones. If "E. M.," "Extension," and others are so sure that their systems are best, let them by all means preach and practice them to the top of their bent. Their systems are doubtless infinitely preferable to the lack of all systems, which so generally prevail, under which so many of our fine old orchards are languishing and dying [old age? Ed]. But it is most desirable on the grounds of husbanding our cultural and literary force, that in illustrating our own views, we should not misrepresent nor caricature the practice or theories of others. Cultivators are many-sided—I had almost said many-eyed. And many surely see the merits of summer-pruning without being blind to those of extension. On the other hand, an "extension" grower may lay in long rods without being blind to the merits of hard-pruning. Until cultivators recognise the full force of local environment, and Nature's modes of culture, life, and its products, it will be impossible to pronounce *ex cathedra* in advance what treatment may prove most profitable. Not that I believe in summer-pruning the less—but in all other reasonable methods the more that they fit in with local conditions of soil, climate, and products. As, however, recent events seem to have revealed considerable misapprehension as to summer-pruning and pinching, I will embrace an early opportunity of recapitulating its merits, principles, and results, as practised amongst us in this year of drought, 1893. *D. T. Fish.*

—Considering the very slight prompting that induced Mr. Fish to pen a column or more on this subject on June 3, I am probably correct in attributing his subsequent silence to the fact that he has been spending the interval hunting for examples of his pinching system "rooted in science and embodied in practice," to match the examples sent you by "E. M." and myself. If this surmise be correct, you are not likely to hear from him for a considerable period, and meanwhile I would like to define Mr. Fish's "quarter-of-a-century" old school a little more clearly than he has done, just to show what that school is, and on what a slender foundation Mr. Fish's knowledge of it rests, as shown by his severe criticisms of "E. M.," in which he is careful not to commit himself beyond vague generalities. He is, however, clear enough in condemning "E. M.'s" description of the usual practice of pinching to "2 or 3 inches" or "two or three eyes," as explicitly stated by "E. M.," who is also condemned on that account as not knowing "the mere alphabet" of the subject. "E. M." is, however, quite orthodox in his interpretation of the general practice; if anything, he is a little too liberal in that respect. But that Mr. Fish himself has not mastered "the alphabet" of the school he professes so much devotion to, will be easy to show. Mr. Fish has sat at "the feet of Lindley" on this subject, he says, but his ears have been shut to his preceptor's voice. Here is Lindley's description from p. 378, *Theory and Practice on Pruning the Pear*. Alluding to Cappe's method, he

says:—"He pinches all the young shoots not required to form branches, when in a very young state; when they have scarcely pushed a finger's length, they are shortened to about 1 inch, or from that to 1½ inch;" and when secondary shoots are produced from these shoots the same season, "he also pinches these to 1 or 1½ inch from where they originated. They rarely push again, but if they do, their growths are again reduced as before." The *Gardeners' Assistant*, last edition, p. 406, says "it is now found to be the best mode to pinch them (lateral shoots) immediately under the sixth leaf. . . . Many of these shoots will push again after the first stopping, and when these are 3 or 4 inches long, they are pinched back to three buds, or to about 1½ inch from their bases." Now this is the practice ridiculed by Mr. Fish. If Mr. Thompson's three buds be equal to 1½ inch, under his sixth leaf must just be about equal to "E. M.'s"

bracketed "current year's shoots" instead of "old spurs," he would have done justice to what I did write. The cultivators I alluded to, do cut away some of the current year's shoots instead of pinching them in the orthodox way, because they know they can get fruit enough without spending time in pinching these shoots so often before fruit spurs form at their base. The admission of air and light to the branches by the complete removal of some of these current season's shoots is of more value to the tree than the spurs formed after a lapse of a year or two, and which perhaps never form at all anything better than wood-buds. They (and I agree with them), consider the practice a good one, where the shoots are so numerous produced as to rob the branches of the amount of sunlight, &c., necessary to mature the wood thoroughly, as unless this occurs fruit cannot

theory is opposed to fact. These are the points in fruit culture that I recommend to the readers of the *Gardeners' Chronicle*, and to "W. L. C." in particular. There should be no misunderstanding of these words, as I have endeavoured to put them as plainly as possible, and in such a manner that they can only be wilfully misconstrued. E. M.

CYRTANTHUS HELICTUS.

Our illustration gives a representation of this rare and pretty *Cyrtanthus* of the *Gastronema* section, which, according to Mr. Baker (*Amaryllidaceae*, p. 58), is identical with *Cyphonema Loddigesiacum*, *Herb.*, and an ally of *Cyrtanthus uniflorus*, from which it differs mainly by having spirally-twisted leaves. By the evidence of the specimen from which our illustration was taken, and which flowered with Mr. Jas. O'Brien at Harrow-on-the-Hill, too, it seems to have the power of bearing more flowers in an umbel than *C. uniflorus*. The flowers are creamy white, with crimson stripes down the segments, the colour suffusing the inner portion of each. It is a Cape bulb, requiring a cool greenhouse or bulb-pit slightly heated in winter.

KEW NOTES.

HIPPEASTRUM PROCERUM.—This is the *Amaryllis procera* of *Flora des Serres*, t. 2077—8, the *A. Rayneri* of *Bot. Mag.*, t. 5883, and the "Blue *Amaryllis*" of horticulturists. There is a group of it planted in a side bed in the succulent-house at Kew, two plants of which are now flowering. The figure in the *Botanical Magazine* does not do the plant justice, the colour of the flowers being a delicate shade of mauve with numerous reddish spots. The falcate, glaucous green, whitish-margined leaves, arranged distichously on a long stalk-like neck, 2 feet long in some of the plants, taken with the fact that the plant is ever-green, and the flower-segments regular, would almost suggest that this is no *Hippeastrum* at all. Has it ever been crossed with the *Hippeastrums* of the *H. aulicum* type? All who are interested in bulbs should see these plants, which are amongst the prettiest and most interesting bulbous plants flowered there in recent years. *Amaryllis procera* is a native of South Brazil, from whence it was first introduced into Belgium by M. Binot in 1863. It rarely flowers under cultivation.

Crinum Kirkii from the Kilimanjaro, a handsome stove species with large nodding, red-striped flowers on a short peduncle; *C. angustum*, still the handsomest of the large-flowered tropical species; *C. Moorei* var. *alba* and *C. americanum* are all in flower in the houses at Kew.

Ismene Amancaes, the beautiful yellow "Peruvian Daffodil," one of the most interesting of large growing South American bulbous plants which thrive in a slightly-protected border; 1. calathina and several species of *Hymenocallis* are in flower now. The hardy lamenes are worth looking after, as they are as well-behaved and free-flowering as the *Belladonna*, and very effective both in leaf and flower.

SOCIETIES.

ROYAL HORTICULTURAL Show at Chiswick.

JULY 11.—A special meeting of the Royal Horticultural Society was held on this date in the Society's Gardens at Chiswick, in good weather. There were the usual miscellaneous collection of Orchids and other plants and fruits, but the number of new plants was small; two *Liliums*, however, were exhibited in flower, to which reference will be seen below. In connection with this meeting was held the annual show of the National Carnation and Picotee Society (Southern Section), and the local Horticultural Society's show, the responsibility of which had been taken over for the present year by the Royal Horticultural Society, assisted by a local committee.

The whole show was disappointing, as the number

FIG. 16.—CYRTANTHUS HELICTUS. Flowers creamy-white, with a crimson stripe on each segment.

inches. This practice is the one adopted, I understand, with the experimental trees at Chiswick, so that Mr. Fish's censure has a pretty wide application, while he does not himself appear to have any method at all. I do not write to defend "E. M." or the practices I have described, but simply to show the confusion of thought that exists on the subject. *Extension*. P.S.—I would like to know where and when Lindley has advocated summer-pinching himself in this country. E.

— If I hurt "W. L. C.'s" feelings (p. 723 of last volume of *Gardeners' Chronicle*), by accusing him of having misconstrued my words, I am sorry. I did not mean to be uncourteous, as he points out a discussion by practical men is instructive. But "W. L. C." will excuse me if I again point out to him how he misquotes (p. 749) what I did say on p. 666. By the addition of the words "old spurs" he renders the quotation a totally misleading one. I challenge him to point out in the quotation he gives, where I use the words alluded to. If he had

follow. With pleasure I reply to "W. L. C.'s" last inquiry relating to wall trees, &c. Peach trees I relieve of all unnecessary shoots when disbudding, and when they are but a few inches long, if by chance a few are left they are removed when the shoots are tied to the wires directly after the stoning, and before the fruit begins to colour. I never pinch the shoots of these trees to induce the formation of fruit spurs. I would ask "W. L. C." if he pinches the shoots with that intent? Apricots are not cultivated in our garden, nor have we any espalier-trained trees—only cordons, horizontally, and fan-trained trees against the walls, and a good many bushes and standards, but no formally-trained pyramids, as I do not see the use of them. Regarding those trees quoted which are wall-trees, I relieve them of superfluous shoots in June, for the purpose named (p. 578), that is, of admitting light, air and wind to the branches, but not with the idea as I pointed out on p. 666, that these pinched-back shoots in June will form spurs at once, and give fruit the following year, because I know such

of exhibits was not nearly so large as the entries led the committee to expect. The Carnation show also was not more than average in its quantity or quality.

Floral Committee.

Present: W. Marshall, Esq., in the chair; and Messrs. Jas. Walker, Geo. Stevens, Chas. E. Shea, Thos. Godfrey, W. C. Leach, R. B. Lowe, Chas. Noble, Robert Owen, Chas. Jeffries, J. H. Fitt, and Frank Ross.

Messrs. J. Veitch & Sons, Exotic nurseries, Chelsea, showed *Ferraria antherosa*, an Iridaceous plant with brown spots on a cream-coloured ground, of interest chiefly for its curious form, and the peculiar habit of growth. It is a Cape plant, figured in *Bot. Mag.* in 1804, t. 751, but this plant was, we are told, introduced from West Australia (Award of Merit). *Lilium speciosum* from Japan, of a height of 1½ to 2½ feet, white, in form between *auratum* and *longiflorum* (First-class Certificate). It is identical with one shown by Dr. Wallace. Another good plant was *Pitcairnia amaryllidifolia*, with erect green channelled leaves, having a grey tomentum on the lower surface; flower shaft 2 feet high, furnished with clasping bracts; head of bloom 6 inches high, of a light scarlet tint. *Begonia decora*, with small oblique foliage, 3 inches high, brown in colour, with light green veins and ribs, and a good panful of *Strobilanthes Dyerianus* were also shown.

Messrs. Chas. Lee & Son, of Hammersmith and Feltham, staged a group of hardy ornamental shrubs, including a *Ginkgo adiantifolia*, with yellow variegated leaves, and *Quercus pedunculata*, with white variegation (Silver-gilt Flora Medal). A small group of *Begonias* (tuberous), in 5 inch and 6-inch pots, was sent by Messrs. H. Cannell & Sons, Swanley, Kent; they were from seed sown last February, and had now commenced to throw very good blooms.

From M. V. Lemoine, Nancy, were sent a plant each of fibrous-rooted *Begonias*, from 9 inches to 1½ foot; *Bajoensis*, white and pale pink blossoms; B. Illustration, rosy-red flowers; B. Sieberiana, pink; B. Abundance, B. Diadem, carmine; B. La France, rosy-red; B. Schmidtii hybrida rosea, pale pink; and B. S. h. alba. They were all very pretty, useful varieties.

Messrs. Wallace & Co., Colchester, obtained a First-class Certificate for the *Lilium* from Japan above mentioned, probably a garden hybrid, most like *auratum* in form, but pure white, excepting green veining; the plants shown were about 15 inches high, and had three blooms on a stem. We do not give the name attached to the plants, as the species is not yet determined.

Mr. Anthony Waterer, Knap Hill Nursery, Woking, sent sprays of his variety of *Spiraea Bumalda*, called "Anthony Waterer," very much deeper in colour than the type, and which will make a very effective plant either for the border or for cutting from.

Messrs. J. Laing & Sons, Forest Hill, exhibited a *Dracæa indivisa aurea variegata*. This is a very pretty table plant, with yellow veining in the leaves (Award of Merit); *Caladium Baronne de Maimore*, a very telling variety, with leaves of green and white, and exceptionally deep red veins (Award of Merit). *Begonia Sunbeam* is a large single, orange-yellow; and B. Lady Balfour of Burleigh, a very deep double bloom of golden-yellow. Also a basket of *Lobelia Lewry's Beauty*.

A very fine and tastefully-arranged group of Ferns and foliage plants was that staged by Mr. H. B. May, Dyson's Lane Nurseries, Upper Edmonton; the group included many interesting plants, all well-grown; *Adiantum lunulatum*, *Gymnogramma schizophylla gloriosa*, *Adiantum Farleyense*, *Pteris Victoria*, and some well-coloured *Crotons*, helped to brighten up the group (Silver-gilt Flora Medal). On p. 61 of the present issue we give an illustration of the end of a fern house at Mr. May's Nursery, with *Woodwardia radicans* right in front, and a specimen of *Platyserium alcorni* hanging from the roof.

Messrs. Sutton & Sons, Reading, contributed a group of plants representing varieties of *Begonia semperflorens* which has been raised at this establishment. They were exceptionally well-grown plants in about 6-inch pots, densely covered with bloom, and are extremely pretty for window and house decoration, as well as for outside beds, where the leaves of some of the varieties become coloured. Reading Snowflake is pure white, with rather large green leaves; and the best for bedding would be one called *Crimson King*, an effective but rather light crimson—the foliage, when out-of-doors, also assumes colour. Duchess of Edinburgh is pale rose and white, and Duchess of York a more decided rose. Coral Gem is deep flesh in colour. Some new

varieties of *Achimenes* and Bedding Stocks were also included in this group (Silver Flora Medal).

Messrs. B. S. Williams & Son, Upper Holloway, London, N., staged a group of stove foliage plants, including some very fine *Crotons*, *Palms*, *Dracæas*, *Caladiums*, &c., as well as a few *Orchids*, such as *Braessavola Digbyana*, *Cypripedium Stonei*, *Cattleya Mendelii*, *Thunia Bensoniæ alba*, &c. (Silver Flora Medal).

E. H. Watts, Esq., Devonhurst, Chiswick, was given a Bronze Medal for a group of six large Ferns of the common exotic species (Bronze Banksian Medal).

Messrs. Hugh Low and Co., Clapton Nursery, London, N., were awarded a First-class Certificate for a new Lily, *L. Lowii*. Upon the specimen shown were borne two flowers, upon a slender stem about 3½ feet high. The petals were about 1½ inch wide, recurved 1½ inch at tip, white, with minute violet-crimson spots. Leaves very narrow, 2½ inches long. G. H. Cammel, Esq., Brookfield, Hathersage, showed flowers of *Alstromeria aurantiaca*, very bright orange, the two upper petals marked with chocolate (Award of Merit).

Sprays of *Cytisus capitatus*, *C. nigricans*, and of *Colutea arborescens purpurea*, described as a new hardy shrub, were from Messrs. R. Veitch & Son, Exeter.

Messrs. Laxton Bros., Bedford, sent blooms of a new Sweet Pea, called *Princessa May*, a rather large heliotrope coloured variety.

The variegated form of *Nicotiana glauca*, which was shown at the Ghent Quinquennial by M. Sallier Fils, Neuilly, Paris, was exhibited by him on this occasion. In a mass, it might be effective, but the variegation is not very decided. An Award of Merit was made.

Orchid Committee.

Present: Harry J. Veitch, Esq., in the chair; and Messrs. Jas. O'Brien (Sec.), Dr. M. T. Masters, F.R.S., Chas. Pilcher, and E. Hill.

The labours of the Orchid Committee, when the show is held at Chiswick, are always lighter than at the Drill Hall, and on the occasion under notice there were but few striking exhibits.

Messrs. F. Sander & Co., St. Albans, staged a small group of good things, among which *Cypripedium* × *Massaianum* (superciliare ♀, *Rothschildianum* ♂) was the most remarkable, being the first cross with *C. Rothschildianum*. It had the stout hairy scape of *C. Rothschildianum*, and distinct traces of its ample striped floral bract. The flowers were large, the upper sepal white, closely striped with lines of chocolate-red, the broad, deflexed, ciliate petals creamy-white, tinged with green in the veining, and regularly and profusely spotted with dark purplish-crimson; pouch large, tinged on the face with rose (Award of Merit). Messrs. Sander also showed plants of *C. × Umlaufianum* (insigne *Chantini* ♀, *Lawrenceanum* ♂), *C. Youngianum*, with pretty *Aërides Pacotianum*, resembling a stout form of *A. Houlettianum*; two specimens of the white *Roriguezia pubescens*, with about twenty spikes each; the clear rose-coloured *Cattleya Gaskelliana*, Cooke's var.; *Brassia lanceana longissima*, four dissimilar plants of the pretty *Trichocentrum tigrinum*, a bright form of *Lælio-Cattleya* × *Schilleriana*, the handsome *Epidendrum vitellinum auratum*, the rare scarlet and yellow *Renanthera matutina*, *Cattleyas*, &c.

Messrs. Hugh Low & Co., Clapton, E., also staged a neat group, in which were the fine white *Stanhopea Amesiana*, some very handsome forms of *Cattleya Gaskelliana*, one of them almost pure white; the new and pretty *Aërides J'Ansoni*, *Cattleya Eldorado alba* and *C. E. splendens*, *C. Schilleriana*, *Epidendrum nemorale*, *Disa grandiflora*, *Oncidium lanceanum*, *Angraecum articulatum*, *Vanda Kimballiana*, *Rhyncostylis guttata*, &c.

Thos. Statter, Esq., Stand Hall, Whitefield, Manchester (gr., Mr. R. Johnson), showed *Cypripedium Stonei* *Cannaertianum*, a very fine form, in which the face of the large dorsal sepal is white, but showing through it the rich dark crimson of the outer surface; the petals are broader than in the type, cream-white, with one row of chocolate spots up the centre, the extreme halves being entirely of a dark reddish purple (Award of Merit). Mr. Statter also showed a flower of a fine form of *Cattleya Brymeriana*, a spike of *Lælio-Cattleya* × *Amesiana*, and a plant of the pretty orange-scarlet *Lælia monophylla*.

Walter C. Clark, Esq., Orleans House, Aichurth Drive, Sefton Park, Liverpool (gr., Mr. T. Jones), sent a three-flowered spike of a good form of *Cattleya Rex*, with the information that it was one of two

borne by the same plant, which, although showing improvement every year, has never made a root in this country. Messrs. Lewis & Co., Chase Side, Southgate, N., exhibited *Cattleya Gaskelliana Southgatensis*, a very pretty light variety; and a *Cypripedium* × *Bradshawianum*, a variety closely resembling *C. × radium* (*Spicerianum* × *Lawrenceanum*). And in a group of miscellaneous plants, Messrs. B. S. Williams & Son, Victoria and Paradise Nurseries, Holloway, N., had the striking fringed *Lælia Digbyana* and *Odontoglossum Harryanum*, *O. hastilabium*, *Cypripedium superbiens* *Demidoff* var., *Epidendrum nemorale*, *Lycastes*, &c.

Fruit Committee.

Present: Philip Crowley, Esq., in the chair; and Messrs. J. Cheal, S. T. Wright, W. Bates, F. Q. Lane, Geo. Wythes, G. Taber, W. Warren, T. F. Rivers, P. C. Veitch, G. Reynolds, Harrison Weir, H. Balderson, G. H. Sage, W. H. Divers, A. Dean, and J. Willard.

A collection of fruits exhibited by Mr. Leach, gr. to the Duke of Northumberland, Albury Park, included some good Black Hamburg Grapes, two dishes of *Grosse Mignonne* Peach (large), a basket of Mrs. Osborne Raspberry, and branches of Plums River's Early Prolific, Early Orleans, and Bradley's King of Damsons.

Mr. J. Miller, gr. to Lord Foley, Ruxley Lodge, Esher, had two dishes of Royal George Peach, and a dish of *Elruge Nectarinas* and *Violets* *Hative*. These latter were exceedingly high-coloured and good; also six large fruits of *Ponderosa* Tomato (Cultural Commendation).

Messrs. T. Rivers & Son, Sawbridgeworth, had a very fine collection of orchard-house fruit. *Princessa* of Wales Peaches, very large; and a seedling Peach, of which twelve good fruits were shown, were very pretty, Apricot coloured. Early Rivers Peach, Early Rivers Nectarine, Hales' Early Peach (very highly coloured); a collection of very fine Cherries, in about fifteen varieties, and the following Plums, all good: Grand Duke, Early Transparent Gem, Victoria, Monarch, Jefferson, and the small Stint Plum (Silver Knightian Medal).

Mr. J. Hudson, Gunnersbury House Gardens, staged six bunches of Black Hamburg Grapes, which had been cut from one Vine, in a 12-inch pot, and represented nine pounds six ounces of fruit (Cultural Commendation).

Messrs. J. Veitch & Sons, Chelsea, staged a very large collection of Gooseberries, including some 160 dishes. This is not a season for extra large Gooseberries, but some of them here were of excellent quality and size, and the general collection better than we should have expected, as in many localities great havoc has been made by red-spider. Some very fine Red and White Currants, a few dishes of Cherries, Raspberries, and Apples, were also shown (Silver-gilt Knightian Medal).

Mr. Thomas Berridge, Norwood Lodge, Southall, sent a plant of Tomato Norwood Lodge, to show its free-fruiting qualities.

M. A. South, Esq., Neaden House, Neaden (gr., Mr. C. Payne), had a variegated Vine, bearing one bunch of half-grown berries in a large pot; the young shoots were a golden-yellow.

Messrs. Cooper, Taber, & Co., Ltd., Witham, Essex, sent pods and branches of Cooper's White-eyed Long-pod Bean, described as being a heavy cropper, tender, and having a better flavour when cooked than any other. No award was made.

Mr. Owen Thomas, gr. to Her Majesty, at the Royal Gardens, Windsor, showed six fine fruits of Royal George Melon, a hybrid from High Cross Hybrid, and Hero of Bath; the hybrid has red flesh. Also twelve very large fruits of Walburton Admirable Peach.

Seedling Melons also came from Mr. Jno. Crawford, The Gardens, Coddington Hall; and from Mr. Jas. Barkham, The Gardens, Longford House, Ryde, Isle of Wight.

Messrs. Hurst & Son, Houndsditch, E., exhibited fruits of Dunedin's Favourite Tomato; it is a medium-sized fruit, very heavy, has very few seeds, and is among the earliest to ripen.

Mr. J. Douglas again exhibited his seedling White Grape from Black Hamburg and White Muscadine.

NATIONAL CARNATION AND PICOTEE.

JULY 11.—The annual exhibition of this Society was held in conjunction with the committee meetings of the Royal Horticultural Society, in the Chiswick Gardens, on this date. We expected a

rather disappointing display, but were agreeably surprised to find a show not far below the average, the flowers not even small in size in most instances, and usually fine for colour, although run colours are only too common this season. The blooms showed few traces of the recent severely hot weather, and throughout the classes were filled, in many instances the competition running very close.

CARNATIONS.

These were placed first in the schedule, and the largest class was for twenty-four blooms, twelve to be dissimilar. The premier award was made in favour of Mr. J. Douglas, Great Gearies, Ilford, who showed apart for several fine unnamed seedlings, P.F. Charles Henwood, P.P.B. Harmony, a beautiful flower; S.F. Mrs. C. Graham, Tim. Bobbin, P.F. Mrs. Douglas, S.B. Ed. Adams, S.B. Robert Lord, S.B. Arthur Medhurst, and S.B. Ed. Rowan. The 2nd place was gained by Mr. Charles Turner, The Royal Nurseries, Slough, whose flowers, like those in the 1st prize stand, were remarkably fresh, and clear in colour. Again several seedlings were exhibited, and of much beauty were the blooms of P.F. Charles Henwood, R.F. Lady Mary Currie, S.F. Mrs. C. Graham, S.B. Dr. Hogg, P.F. Billy Henderson, P.P.B. Mr. Smith, P.P.B. Harmony, S.B. C. H. Herbert, besides other named kinds, all in good character; Mr. F. Hooper, Bath, was 3rd.

The next class was for twelve blooms, distinct, and the London grower, Mr. Martin Rowan, of Clapham, was 1st. His box contained the Premier Carnation in the show, a very large and well-developed bloom of S.B. Robert Houlgrave, and other kinds of note were S.F. Sportsman, C.B. Edward Rowan, C.B. J. D. Hextall, C.B. J. S. Hedderley, P.F. Gordon Lewis, and R.F. Rob Roy. This was a good place, considering that the competition was very keen; Mr. Arthur R. Brown, Handsworth, Birmingham, was a good 2nd, and noteworthy amongst his smooth flowers were S.B. Robert Houlgrave, R.F. Lady Mary Currie, P.F. Billy Henderson, S.B. Admiral Curzon, and C.B. Fred Phillips; Mr. George Chaundy, Oxford, was 3rd. The best six distinct flowers were those from Mr. J. J. Keen, Southampton, who had clear-coloured fresh flowers of Robert Houlgrave, S.F. Alismond, and Squire Potts; Mr. Douglas came 2nd, and his flowers were of excellent quality; Mr. A. J. Sanders, gr. to Viscountess Chewton, Cobham, 3rd.

The classes for single blooms were interesting, but there is not much beauty in such exhibits.

PICOTEES.

These were very pure and distinct in their markings generally, and made a great display, the flowers in the winning stands were of conspicuously high quality. As with the Carnations, the most important class was for twenty-four blooms, in not less than twelve distinct varieties. The principal winner was Mr. Chas. Turner, who had a surprisingly fine box, in which the chief kinds were—L.R.S.E. Lady Holmeadale, Liddington's Favourite, still the best of the light rose and scarlet-edged class; L.P.E. Sylvina, L.P.E. Esther, L.R.E. Brunette, L.R.S.E. Madeleine, L.R.S.E. Little Phil, L.P.E. Zerlina, and L.R.E. Norma. Mr. Douglas was 2nd, and in his stand we noted as of special excellence, Liddington's Favourite, and a new seedling named Ganymede, a heavy red-edged Picotee, and the same exhibitor had a number of highly-promising seedlings. The 3rd place was won by Mr. F. Hooper.

The competition was exceptionally keen in the class for twelve blooms, in which Messrs. Thomson & Co. came 1st; they showed well the varieties L.S.E. Mrs. Sharp, L.P.E. Zerlina, L.R.E. John Smith, Liddington's Favourite, L.R.S.E. Little Phil, L.P.E. Amy Robsart, L.R.E. Thomas William, L.R.E. Brunette, L.R.S.E. Campanini, and L.R.S.E. Mrs. Burnett. The 2nd prize box of Mr. A. R. Brown containing many good blooms. Mr. Rowan 3rd.

For six blooms, distinct, Mr. A. W. Jones, Handsworth, Birmingham, was 1st, with L.R.S.E. Mrs. Payne, and this was judged the premier bloom in the show. Others exhibited were L.S. Norman Carr, L.R.S.E. Little Phil, Campanini, belonging to same section; L.P.E. Clara Penson, and L.R.E. Brunette. An excellent stand of flowers came from Mr. J. P. Sharp, Birmingham, and was placed 2nd; Mr. A. Greenfield, 3rd.

Two classes were set apart for yellow grounds, the largest being for twelve blooms, distinct, the 1st prize going to Mr. Charles Blick, gr. to Martin Smith, Esq., Hayes Common, Kent; the flowers were exceptionally full, and of very rich colour. The most conspicuous were Stadrath Bouel, Dorothy, Remembrance, Annie Douglas, Cowspig (a pleasing

name), Optimus, Chrysdora, and Almira. Mr. C. Turner was a good 2nd, and in his stand were fine flowers of Almira, Annie Douglas, Agnes Chambers, and Arthur Barrett; Mr. J. Douglas was 3rd; Mr. Chas. Phillips and Messrs. Thomson & Co., 4th and 5th respectively; Mr. Geo. Chaundry, 6th; and Mr. Thos. Anastas, 7th. For six, Mr. A. W. Jones was 1st, with Mrs. Robert Sydenham, Almira, Victory, Lord Rendlesham, and Stadrath Bouel. The latter variety was shown well throughout. Mr. A. K. Brown, who was 2nd, had it in fine character; Mr. Sydenham, 3rd; Mr. Charles Harden, 4th; and Mr. F. Nutt, Southampton, 5th.

The classes for single blooms deserve high praise for the purity and fullness of the flowers. Five prizes are given in each class, and for heavy red-edged, Mr. Turner 1st (Morna); Mr. A. R. Brown, 2nd (Brunette); Mr. C. Phillips 3rd and 4th (Morna); Mr. J. Douglas 5th (Ganymede).

For light-edged, Mr. A. W. Jones 1st (Mrs. Gorton); Mr. Rowan 2nd, same variety; Mr. Jones 3rd (Thos. William); Messrs. Thomson & Co. 4th, same variety; Mr. Brown 5th, same kind. In the purple class, for heavy-edged, Mr. J. J. Keen 1st (Amy Robsart); Mr. Jones 2nd, same kind; Mr. Rowan 3rd (Muriel). For light-edged, Mr. Rowan 1st (Amy Robsart)—we supposed this kind may be classed under both headings; Messrs. Thomson & Co., 2nd (Edith); Mr. Brown 3rd (Pride of Leyton); Mr. Jas. Douglas 4th (Ann Lord); Mr. J. Keen 5th (Pride of Leyton). For heavy rose-edged, Mr. A. W. Jones 1st (Campanini); Mr. C. Turner 2nd; and Mrs. Payne 3rd (Little Phil). For light, Mr. A. R. Brown 1st and 3rd (Mrs. F. Ricardo); Mr. C. Phillips 2nd (Ethel); and 4th (seedling); Mr. J. J. Keen 5th (Ethel). In the heavy scarlet-edged class, Mr. A. W. Jones 1st (Mrs. Sharp), and Messrs. Thomson & Co. 2nd, Mr. Jas. Douglas 3rd, Mr. J. J. Keen 4th, with all the same variety. For light-edged, Mr. A. W. Jones 1st (Liddington's Favourite), Mr. Turner 2nd, Mr. Brown 3rd, and Mr. J. J. Keen 5th, all with this kind; Mr. Douglas 4th, with Seedling.

Selfs and Fancies.—These were largely exhibited, the best twenty-four blooms, not less than twelve distinct varieties, came from Mr. Turner, who had beautiful specimens of Janira, Gladys, Germania, Dorothy, Rose, Unique, King of Scarlets, Terracotta, Master Fred, Mrs. Wilson, Romulus, Marine Murray, White Lady, The Governor, Ruby, Duchess of Sutherland, and Stadrath Bouel; the 2nd place was well-filled with flowers from Mr. Jas. Douglas, including many of his own raising; whilst Mr. Charles Blick was 3rd; and Mr. F. Hooper, Bath, 4th. The chief award for twelve, distinct, was made in favour of Messrs. Thomson & Co., the finest blooms being those of Germania, Attraction, pink; King of Scarlets, Mrs. Reynolds Hole, and Mrs. Fred. White; Mr. A. R. Brown was placed 2nd, for excellent blooms; Mr. C. Phillips, 3rd; Mr. G. Chaundry, 4th. Good competition took place in the class for six, distinct, the 1st prize being awarded to Mr. A. W. Jones for fine flowers of Norman Carr, Stadrath Bouel, Germania, Almira, Lord Rendlesham, and Gladys. The other prize-winners were Mr. J. F. Kew, Southend, 2nd; Mr. J. Jordon, gr. to R. Hart, Esq., Sutton, Surrey, 3rd; and Mr. T. E. Henwood, Reading, 4th.

Pot Plants.—Only one class was provided for these, and a white card round the blooms was forbidden. The awards were given for cultural excellence, and a liberal show of flowers. The 1st prize was awarded to Mr. J. Douglas, who had plants of good growth, well-flowered, and the flowers of self colour. Mr. C. Turner 2nd.

For six blooms, open only to those who have never won a prize, Mr. C. Harden, Dover, was 1st, and his flowers were distinctly creditable. Harmony was well shown.

Vases, Sprays, &c.—Three classes were set apart for this form of decoration. The best vase of Carnations or Picotees, only one kind to be used, of either section, Mr. Jas. Douglas 1st, Mr. E. C. Goble 2nd, and Messrs. Thomson & Co. 3rd. Whilst for three sprays, very creditable were those from Messrs. Thomson & Co., who were 1st; Mr. J. Walker, Thame, 2nd; Mr. C. Gotte, 3rd; and Mr. Jas. Douglas, 4th. Mr. Douglas had the best button-holes of Carnations, and was closely followed by Messrs. Thomson & Co.

Mr. Martin Smith's Prizes.—Three classes were set apart for those exhibits in competition for Mr. Smith's prizes. Certain rules were to be followed, and the flowers were to be gathered only from plants that had been "wintered without protection in the open border, and staged without 'dressing,' and

exactly as they were cut from the plants." A burst calyx to be a disqualification. The first class was for the best border or self-coloured Carnation, not less than twelve trusses. Mr. Sage, gr. to the Earl of Dysart, Ham House, Twickenham, had a bunch of scarlet self, named Jim Smyth; it is a showy and handsome flower, well worthy of the award. Mr. E. C. Goble, 2nd; Mr. J. Douglas, 3rd; and Mr. W. H. Divers, Ketton Hall Gardens, 4th. The next class was for six varieties of self-coloured Border Carnations, not less than six trusses of each variety. This made a lovely display, and the 1st prize went worthily to Mr. J. Douglas; Mr. J. Walker, Thame, 2nd; Messrs. Thomson & Co., 3rd; and Mr. W. H. Divers, 4th. The following class admitted flakes, bizarres, and fancy kinds, Carnations and Picotees; Mr. J. Douglas had a charming assortment, and was 1st; Mr. F. Hooper, 2nd; Mr. W. H. Divers, 3rd.

A large number of First-class Certificates were given, and we enumerate the following. Owing to the careless way in which the flowers are placed about at these shows, and with no official list published, it is impossible to enumerate kinds thus honoured. The following were from Mr. C. Blick, who had the major portion of seedlings. Of fancy Picotees, good kinds are George Cruikshank, buff yellow ground, with heavy markings of scarlets; Sirius, a fancy Picotee, similar ground, bright scarlet splashes; Cardinal Wolseley, yellow ground Picotee, better than Victory, fuller, richer, though similar; The Dey, yellow ground Picotee, with heavy rose edges; Rosa Bonheur, a beautiful scarlet flake; Tom Sayers, buff, with stripes not very deep of crimson—a good Carnation; Bendigo, self purple—very handsome Carnation; Andray Campbell, yellow self variety; Sir Gauvaio, similar to Mrs. Reynolds Hole, of apricot tone; Mephisto, deep crimson-maroon self; The Patriot, a splendid addition to the crimson bizarre class; Duke of Orleans, yellow self, very fine; Ellen Terry, white, pure, and full; and Hayes' Scarlet, scarlet, a brilliant colour, self. A seedling raised by Mr. Douglas, and called Agricola, was shown by him in winning stand; it is a superb purple flake.

Miscellaneous.—Mr. C. Blick, gr. to Mr. Martin Smith, had a large group of seedlings and other kinds, well staged in loose bunches; and a large collection of border kinds, cut from the open air, came from Mr. T. S. Ware, Hale Farm Nurseries, Tottenham (Silver Medal). Wm. Robinson, Esq., Gravetye Manor, East Grinstead, showed a beautiful self white Carnation, named Alice; the flowers were not split, and the large bunch was arranged as we should like to see all Carnations at shows.

CHISWICK LOCAL SHOW.

JULY 11.—This exhibition, which was held in the grounds and under the management of the Royal Horticultural Society, was not so large a one as might have been expected. Various reasons were given for this, and it is hoped that a better exhibition will be held next year.

The 1st class was for a group of plants arranged for effect upon ground not exceeding 100 square feet, open. A very fine group was staged by Messrs. W. Fromow & Sons, Sutton Court Nursery, Chiswick, some good Lilliums, Crotons, Pancratiums, Cocos Weddeliana, with some larger Palms at the back, were very tastefully arranged.

In the class for amateurs for a group of plants arranged for effect, not to exceed 75 square feet, the successful exhibitor was E. H. Watts, Esq., Devonhurst, Chiswick (gr. Mr. Porteous). The group was not very rich in plants, but with a ground-work of Adiantum Ferns and some Lilliums, Palms, Caladiums, &c., an interesting group was arranged. Dr. Tuke, Chiswick House (gr. Mr. H. Aspland), was 2nd.

Mr. C. Turner, Royal Nurseries, Slough, took 1st prize for a group of Pelargoniums to cover not more than 100 square feet, with a group of plants in very fair condition.

For the Silver Cup offered for the best group of twelve tuberous Begonias, distinct, arranged with small flowering plants, a very exceptional collection was staged by Sir Charles Pigott, Bart., Wexham Park, Slough (gr. Mr. J. Ford). The plants were large, in 9-inch and 10-inch pots, all very good; but one single variety of deep velvety-crimson, large, and of good substance, attracted more than ordinary attention.

The best Coleus, in six plants, came from A. Russell, Esq., Woodlands, Isleworth. Col the Hon. W. P. Talbot, Glenhurst, Esher (gr. Mr. C. J.

Waite), brought the best six hardy Ferns from amateurs, showing pretty good specimens in 10-inch pots. T. E. H. Hodgson, Esq., Ranelagh House, Grove Park (gr., Mr. W. H. Davies), took 1st for six plants of Gloxinias, with very fair specimens.

Twelve bunches of hardy herbaceous perennials were best shown by Earl Dysart, Ham House, Richmond (gr., Mr. G. H. Sage), consisting of *Heliopsis patula*, *Eryngium Olivarianum*, *Echinops Ritro*, *Coreopsis lanceolata*, *Gypsophila paniculata*, *Centaurea vars.*, *Helenium var.*, *Delphinium*, *Erigeron*, *Chrysanthemum maximum*, and *Statice speciosa*; Dr. Tuke, Chiswick House, was 2nd.

The 1st prize for eight bunches, was taken by Miss R. Debenham, St. Peter's, St. Albans, *Lathyrus latifolius albus*, *Eryngium amethystinum*, and *Phlox decussata*, were very good.

Stove or greenhouse flowers in twelve bunches, were best shown by E. H. Watts, Esq., Devonhurst, Chiswick (gr., Mr. Porteous), and Dr. Tuke was 2nd. T. E. Hodgson, Esq., Ranelagh House, Grove Park (gr., Mr. W. H. Davis), staged the best twelve bunches of zonal Pelargoniums, but these were only fair.

ROSES.

The 1st open class for twenty four Roses, distinct, was competed for by several exhibitors, but the general character of the blooms was not above fair. Messrs. Harkness & Sons, Bedale, Yorkshire, were 1st, and in this stand there were some good blooms, such as Marie Baumann, Séateur Vaisse, Louis Van Houtte, Mons. E. Y. Teas, Etienne L'vet, &c.; Mr. George Mount, The Rose Nurseries, Canterbury, was 2nd, but his flowers were small; the 3rd place was taken by Mr. B. R. Cant of Colchester.

Messrs. Harkness & Son, Bedale, Yorks, won the 1st prize and the Silver Cup for twenty-four Roses, distinct, three trusses of each, in this class also were some good blooms: *Horace Vernet*, La France, Earl of Dufferin, Alfred Colomb, Duchess de Morny, Marie Baumann, A. K. Williams, Exposition de Brie, Gustave Piganeau, and Mrs. J. Laing were the best. Mr. B. R. Cant, who had twice won the cup in previous years, was 2nd; his stand, however, contained some very weak blooms, whilst in some instances the quality was average.

The floral decorations were not numerous, Miss Lilian Hudson being the only competitor in the classes for a stand of flowers for table decoration, and a stand for hall decoration. In each case the arrangement was commendable, and 1st prizes were awarded.

A group of excellent Gloxinias was staged for exhibition by Mr. E. Hythe, Hillcrest, Castle Bar, Ealing (gr., Mr. A. Jones).

There were a good number of classes for cottagers, and these brought some very fair produce; window plants and boxes were good, and vegetables fairly represented. Mr. A. Farmer, Blenheim, Road, Gunnersbury, was the 1st.

FRUIT.

Mr. Thos. Osman, The Gardens, Ottershaw Park, was 1st for two bunches of Black Grapes, with good Black Hamburg; 2nd, Col. the Hon. W. P. Talbot, Glenhurst, Esher (gr., Mr. Waite), with smaller, but better-finished bunches.

In the class for White Grapes, Mr. Osman was again 1st, showing Mrs. Pearson; W. A. Louth, Esq., Neasdon House, Neasdon (gr., Mr. C. Payne), was 2nd, with Muscat of Alexandria; 3rd, E. H. Watts, Esq., with Duke of Buccleuch. The best dish of Strawberries came from J. T. Hopwood, Esq., Ketton Hall, Stamford (gr., Mr. W. H. Divers), who had British Queen.

A. Pears, Esq., Green Bank, Isleworth (gr., Mr. Debnam), was 1st for six Peaches with large, well-coloured fruit of *Violette Hâtive*; Sir Chas. Pigott was 2nd, with large fruits of Barrington. Nectarines were shown best by the Honourable W. P. Talbot, Glenhurst, Esher, who had very highly-coloured fruits of Elruge; Sir Charles Pigott was 2nd, with smaller fruits of same variety; and Earl Dysart 3rd, with Victoria.

VEGETABLES.

Potatoes were of very fair quality, the best three dishes coming from the Hon. W. P. Talbot; Mr. A. Farmer, Railway Cottages, Blenheim Road, Gunnersbury, was 2nd; and Earl Dysart, 3rd. Earl Dysart showed the best Tomatoes in three dishes, and had very fine fruits; W. A. Louth, Esq., was 2nd.

Two good Cucumbers, Sutton's Peerless, obtained 1st prize for T. E. H. Hodgson, Esq., Ranelagh House; and Dr. Tuke was 2nd.

The best six dishes of vegetables for Messrs. Carter's prize was staged by Colonel the Hon. W. P.

Talbot. He had good Globe Artichokes, Carter's Perfection Tomato, Carter's Ashtop Fluke Potato, Carter's Holborn Onion, Carter's Summer Favourite Carrot, and Carter's Telegraph Pea. W. A. Louth, Esq., was 2nd; and A. Russell, Esq., Woodlands, Isleworth, 3rd.

Mr. H. Balderson, Corner Hall, Hemel Hempstead, took 1st prize in the class for three dishes of Peas, offered by Messrs. C. Sharpe & Co., Sleaford, Lincolnshire; Col. the Hon. W. P. Talbot 2nd, and Mr. T. Watkins, Grove House, Merrow, 3rd.

IPSWICH FLOWER SHOW.

JULY 5.—The annual summer show of the Ipswich and East of England Horticultural Society opened on the lawn of Christchurch Park on Wednesday, and proved one of the most successful exhibitions that the society has held.

The plants and flowers were well up to the general standard of the show, and Roses were particularly good. The fruit and vegetables were remarkably fine, considering the character of the season.

Roses made a fine show. The day is past for Mr. F. Cant, excellent grower as he is, to have matters all his own way. He, nevertheless, held his own well in the largest class, showing a uniformly excellent (and in no other sense uniform) collection, though the most perfect individual bloom in the show was, perhaps, the *Horace Vernet* in the 2nd prize exhibit. In the other two open classes, Messrs. Prior were to the fore, with Mr. Cant 2nd. In the former of them points were equal as to the quality of the blooms, but Messrs. Prior won on the arrangement. In the amateurs' twenty-fours, Rev. H. A. Berners showed a beautiful collection, including a John Bright, a variety which the previous day took the Silver Medal at Diss for the best H.P. bloom in the show. In the twelves class, the rev. gentleman was beaten by Mr. W. W. Parsons, a Woodbridge exhibitor, who made a very beautiful show. In the Tea Roses, Mr. Berners was a good 1st. Possibly, had the show been a week earlier, the show of Roses all round would have been stronger, but as it stood it needed no apology.

The zonal Pelargoniums made a brilliant display, Mr. R. Austin, sen., carrying off premier honours. Mr. C. Jacobi must be complimented upon the splendid collection of herbaceous flowers he was enabled to put in, which far outshone anything else in the class. Mr. G. Gilbert also showed a good collection in the class for twenty-fours.

The bouquet prizes were carried off by Mr. O. G. Orpen. The ball-room bouquet was a pleasing arrangement of *De Watteville* Roses; and the bridal bouquet, white Roses and Gladioli.

The 1st prize for a basket of cut flowers fell to a new exhibitor, Miss C. Elmslie, of Whitton, after a close competition with Mrs. Orpen.

Taking the classes in the order in which they came, there was not much competition for stove and greenhouse plants, in which Mr. George Gilbert had matters all his own way. The next class for six ornamental foliage plants was also headed by Mr. Gilbert, Mr. Whitfield King coming 2nd. Mr. Gilbert was more strongly represented to a handsome 30-foot group of Palms and zonal Pelargoniums, for which the judges awarded a special prize, and in a remarkable collection of seedling *Coleus* studded over various vacant spots in the tents. These were a fine collection, illustrating in an extraordinary degree the strong varieties of colour which the plant is capable of developing. In the amateur class for group of plants arranged for effect, Mr. Whitfield King was finely represented. The Orchids and Lilies were grandly developed.

The institution of a class of smaller groups for amateurs employing not more than one gardener was this year very successful, and attracted some capital entries. The judges had not much difficulty in singling out Mr. Webster Adams's group, which was a happy combination of brilliancy of colour and lightness of arrangement, with a singularly neat and pretty edging of *S-laginella denticulata*. Dr. Casley's group, which was 2nd, was original in style.

The show of fruit and vegetables would challenge comparison with any show of the year. The Strawberries, considering how prematurely advanced the season is, were very fine. Mr. J. Woods, Woodbridge, and Mr. Alexander Fraser were the 1st prize-winners in the classes for single varieties, whilst Lady North took a similar award for a grand collection. There were also some fine dishes of Cherries shown by Mr. J. A. Burness and Mr. R. Austin, and excellent Peaches were sent in from Woolverstone Hall. The

collections of vegetables were good, and Tomatoes very well grown, and there were some excellent Peas and other vegetables.

The cottagers' exhibits were not so numerous as might have been expected. The time is already passed for most of their summer exhibits. *Suffolk Chronicle*, July 8.

EALING HORTICULTURAL.

JULY 5.—By permission of C. Bartholomew, Esq., the twenty-ninth annual exhibition of this society took place in the grounds of Castle Hill House, Ealing. In some respects the show was an improvement on its predecessors.

For a group arranged for effect, 12 feet by 6 feet, 1st honours were taken with a remarkably pretty arrangement from Mr. W. Roberts, gr. to J. Harris, Esq., Braemar, *Dendrobium calceolus major* being well flowered. 2nd, Mr. C. Long, gr. to E. P. Oakshott, Esq., a very creditable exhibit. Group, 7 feet by 5 feet: 1st, Mr. C. Edwards, gr. to W. Owen, Esq., Castle Bar, a good lot; 2nd, Mr. T. Wiseman, gr. to J. Butler, Esq., North Common Road. Six fine foliage plants: 1st, Mr. C. Long; *Croton* well coloured.

Four fine-foliaged plants: 1st, Mr. W. Roberts; the latter also taking 1st place for six well-grown Ferns. For a specimen stove or greenhouse plant in flower, the premier position was accorded to Mr. C. Long, for a finely-flowered *Allamanda*; 2nd, Mr. C. Edwards, for a well-grown and flowered *Clerodendron Balfourianum*. Specimen stove or greenhouse plant remarkable for handsome foliage: 1st, Mr. A. Denison, gr. to T. A. Gledastanes, Esq., for a grand *Cycas revoluta*; 2nd, Mr. W. Roberts, for a good *Latania borbonica*.

Foliage Begonias were well shown by Mr. J. Wickenden, gr. to R. Dawes, Esq., and Mr. C. Edwards. The four Fuchsias which gained Mr. C. Long 1st honours were fine examples of cultural skill; good-flowered plants from Mr. W. Roberts took 2nd prize.

Six flowering Begonias: 1st, Mr. J. Beasley, gr. to A. Fraser, Esq., The Mount, fine examples; 2nd, Mr. C. Long. Excellently-flowered bedding Pelargoniums gained Mr. G. Wickenden 1st prize, who also took a similar position for *Coleuses*.

Interest centred in the class for eighteen cut Roses, not fewer than twelve varieties; the Gold Medal of the National Rose Society was taken for the fourth time with some good blooms considering the season, by Mr. C. Long; 2nd, Mr. C. Edwards, who had a bright fresh lot. Bunches of stove and greenhouse flowers were shown in grand condition by Messrs. A. Denison and W. Merridew.

Table decorations, as previously mentioned, were a feature. In the class for three stands or vases of flowers, there were seven competitors, the 1st prize, after long deliberation, going to a charmingly elegant arrangement from Mr. W. Merridew, gr. to F. Gerlach, Esq.; a very close 2nd indeed was Miss L. Hudson, Gunnersbury House. One hand-bouquet, 1st prize, a beautiful exhibit, Mrs. W. Roberts, North Common Road, the same lady taking similar honours for three elegant sprays. For a bouquet of Roses, Mr. W. Roberts, gr. to J. Harris, Esq., took 1st prize with an admirable arrangement.

Grapes—black and white, were well shown by Messrs. G. Wickenden and C. Edwards. For Messrs. Sutton & Sons' prizes for a collection of vegetables, the prize-winners were Messrs. C. Edwards and J. Beasley—both showing creditable productions.

The cottagers' show of vegetables and other produce was a good one, considering the extraordinary season.

Mr. G. Reynolds, gr. to the Messrs. Rothschild, Gunnersbury Park, had a strikingly beautiful group of foliage and flowering plants—*Croton*s grandly coloured. Mr. D. Cooper, gr. to E. M. Nelson, Esq., Hanger Hill House, also contributed a good group of similar plants; the same exhibitor likewise showing thirty finely-coloured fruits of *Waterloo* Peach, and fine samples of *Early Rivers* Plum. Mr. J. Hinkley, gr. to J. Chesham, Esq., The Mount, sent a fine lot of foliage and flowering plants; as also did Messrs. Promow & Sons, Chiswick.

Messrs. C. Lee & Son, Ealing and Hammersmith, contributed a beautiful display of cut Roses in all the leading varieties; also a very effective group of hardy ornamental trees and shrubs. *Prunus Pissardi* was well shown, as well as *Cornus elegantissima variegata*, a fine form introduced by Messrs. Lee.

Mrs. H. B. Smith, Ealing, contributed, in her

usual tasteful style, some beautiful examples of table decorations.

A good seedling Tomato, named Norwood Lodge, that will doubtless be heard more of, was shown by Mr. T. Berridge, gr. to T. Unwin, Esq., Norwood Lodge, Southall. It is a cross between Hathaway's Excelsior and Large Red, very free, one plant, in a 9-inch pot, bearing ninety-five fruits.

The show was well managed by Mr. George Cannon, secretary.

BATH.

JULY 6.—The Rose show which was held at Bath in the Sydney Gardens on the above date, although it fell short of previous exhibitions in regard to the number and quality of the blooms staged, was as good as could be expected, and financially it was undoubtedly a success.

NURSERYMEN (OPEN).

There were only two competitors in the class for seventy-two varieties, single trusses, viz., Messrs. Harkness & Son, Bedale, Yorkshire, and Messrs. George Cooling & Sons, Bath, who took the prizes in that order. The Yorkshire exhibits being large, solid, and beautifully fresh, were easily 1st, and included, among others, capital blooms of Duchess of Bedford, Alfred Colomb, Pride of Waltham, Comte de Raimbaud, Dr. Andry, Charles Darwin, Marie Rady, Madame Verdier, Prince Arthur (in grand form), E. Andry, and Duke of Connaught; the best blooms in Messrs. Cooling's stands being Duchess of Bedford, Lord Beaconsfield, Victor Hugo, Duc de Montpensier, Alfred Colomb, Marquise de Castellane and Charles Lamb.

Thirty-six varieties, three trusses of each: Messrs. Harkness & Son being again easily 1st, with a uniformly good, well-shaped, fresh lot of blooms; Messrs. G. Cooling & Son were 2nd.

Eighteen distinct varieties, three trusses of each: 1st, Mr. G. Mount, Canterbury, his best blooms being Alfred Colomb, Maréchal Niel, Edith Gifford, Mrs. Laing, Prince Arthur, Her Majesty, and Ulrich Brunner, all being of good substance, fine form and fresh; Mr. Mattock, Oxford, was 2nd, staging, among others, good blooms of Lady Sheffield, Earl of Dufferin, and Mrs. John Laing.

Thirty-six distinct varieties, single trusses: Mr. Mount was again to the front with good all-round blooms.

Teas or Noisettes, eighteen varieties, single trusses.—1st, Messrs. Harkness & Son, staging very meritorious exhibits, the blooms being neat and fresh, consisting of (back row) Niphetos, Cleopatra (receiving the Silver Medal of the National Rose Society, given for the best Tea Noisette Rose in the show), Madame H. Jameson, Souvenir d'un Ami, Madame Hoste, Comtesse de Nadaillac, Francisca Kruger, Souvenir d'Elise, Madame de Watteville, The Bride, Ernest Metz, Souvenir de S. A. Prince, Caroline Kater, Thérèse Levet, Edith Gifford, Catherine Mermet, Innocente Pirola, and Madame Bravy; Mr. Mount was 2nd.

AMATEURS.

Dr. Budd, Bath, was the only exhibitor of thirty-six varieties, single trusses, and eighteen varieties, three trusses of each, and he was very deservedly awarded 1st prize in each class for stands of bloom that it would be hard to beat at any show this year, Sultan of Zanzibar, Reynolds Hole, La France, Marie Baumann, Edith Gifford, A. K. Williams, Louis Van Houtte, Sir Garnet Wolseley, Longfellow, and Suzanne-Marie Rodocanachi being the most prominent.

Mr. Thomas Hobbs, Bristol, had the best stand of twenty-four varieties, single trusses; Mr. J. Parker having the 2nd best. The last-mentioned exhibitor was 1st for a stand of twelve blooms, distinct; Mr. Hobbs being 2nd, both staging creditable blooms for the season.

Teas and Noisettes.—Dr. Budd had the best stand of eighteen blooms, distinct varieties; Mr. Gray, Bath, having the 2nd best. Mr. J. Parker and Mr. Hobbs, 1st and 2nd for stands of twelve varieties; 1st and 2nd positions being accorded to Dr. Budd and Mr. Parker respectively for stands of six varieties, three trusses of each, all staging creditable blooms.

OPEN CLASSES.

Twelve single trusses of any Rose.—1st, Messrs. Harkness & Sons, staging grand blooms of Mrs. John Laing, one of which was awarded the Silver Medal of the National Rose Society, given for the best hybrid perpetual in the show; Mr. Mattock was 2nd.

Twelve single trusses of any yellow Rose.—1st,

Mr. Mount, with a dozen neat fresh blooms of Maréchal Niel; Mr. Gray taking 2nd place with same variety.

Twelve single trusses of any crimson Rose.—1st, Messrs. Harkness & Sons, with large fresh blooms of Gustave Piganeau.

For twelve single trusses of La France there was only one competitor, Messrs. Harkness & Sons, to whom the 1st prize was justly awarded. Messrs. G. Cooling & Sons secured chief honours in the class for twelve distinct varieties of garden decorative Roses, shown in bunches, only one entry.

Nine bouquets of Roses for the band.—1st, Mr. Mattock; 2nd, Messrs. Cooling & Sons, both staging fine arrangements, composed of choice Tea and Noisette Roses in the bud state. Dr. Budd and Mr. E. T. Hill obtained 1st and 2nd honours in that order for six bouquets of Roses; and Mr. R. B. Cater, Bath, secured premier position for a basket of cut flowers, in the arrangement of which Cattleya Gaskelliana, Dendrobium moschatum, and Arides cylindricum, were made the most of, intermixed with Asparagus tenuissimus and light grasses.

GROUPS OF MISCELLANEOUS PLANTS.

The most attractive feature in the show was one of three groups of miscellaneous plants, arranged for effect, at the lower end of the large tent in which the Roses were shown by Mr. Jas. Cypher.

Several classes were provided for tuberous Begonias and herbaceous plants, and a fine lot of plants and cut blooms were staged. Mr. J. B. Blackmore winning the Challenge Cup given by the Rev. E. Lascelles, Newton St. Loe, Bath, for the best twelve plants of tuberous-rooted Begonias, six single and six double-flowered.

Mr. Davis, Yeovil, and Mr. Cannell, Swanley, contributed several excellent stands of cut flowers of the Begonia.

ROSE SHOW AT MANCHESTER.

JULY 6.—An agreeable mode of enjoying the Royal wedding-day was offered by the proprietors of the Botanical Gardens. They advanced their usual July Rose Show a couple of weeks, and engaged the bands of the 14th Hussars and Manchester Artillery to play in the grounds all through the afternoon and evening. It was probably a fortunate thing that the event of the day provided an excuse for having the show of Roses instead of at a later date. The early summer, with its great heat and little rain, has played havoc with Roses all over the country, and many of the southern rose-growers wrote that they had no blooms to show. Under the circumstances, it was a matter of surprise that so many fine blooms as those shown on Thursday could have been brought together.

The Rev. J. H. Pemberton showed some beautiful specimens of A. K. Williams and A. Colomb; and Messrs. Croll, of Dundee, had a very beautiful display of the best-known kinds. The Roses shown by Mrs. Mellish were also of great beauty. The space which should have been filled by the Southern exhibitors was occupied by collections of hardy herbaceous plants shown by Mr. H. Brownhill, Sale; Messrs. Dickson & Robinson, Mr. F. Law, Sale; Messrs. Dickson, Brown, & Tait, and Messrs. Dicksons, Chester. A number of prizes offered by the Royal Manchester and Northern Counties Botanical and Horticultural Society were awarded as follows:—

Seventy-two distinct trusses: 1st, Messrs. Harkness & Sons, Bedale. Thirty-six distinct, three trusses of each: 1st, Messrs. Harkness & Sons. Eighteen Tea or Noisettes, three trusses: 1st, Messrs. D. & W. Croll, Dundee. Twelve Tea or Noisettes, single trusses: 1st, Messrs. Harkness & Sons. Twelve single trusses of any yellow Rose: 1st, Messrs. D. & W. Croll. Twelve single trusses of any white Rose: 1st, Messrs. Harkness & Sons. Twelve single trusses of any crimson Rose: 1st, Messrs. Mack & Son. Three bouquets of Roses: 1st, Mr. J. Mason, Victoria Buildings, Manchester. Thirty-six distinct single trusses: 1st, the Rev. J. H. Pemberton, Essex. Twelve distinct, three trusses: 1st, Mr. W. Boyce, Twelve Tea or Noisettes, three trusses: 1st, Mr. H. V. Machin, Workop. Twelve Tea or Noisettes, single: 1st, the Rev. J. H. Pemberton. Twelve single trusses of any yellow Rose: 1st, Mr. H. V. Machin. Twelve single trusses of any white Rose: 1st, Mr. H. V. Machin. Twelve single trusses of any crimson Rose: 1st, the Rev. J. H. Pemberton. Twenty-four distinct single trusses: 1st, Mr. T. Tatham, Wilmslow. Twelve distinct single trusses: 1st, Mr. C. Burgess. Six distinct single trusses: 1st, Mr. C.

Burgess. Extra prize for Pansies: Mr. C. Bagshaw, Heaton Mersey. Highly Commended for hardy flowers: Messrs. Clibran & Sons. Extra prize for hardy flowers: Mr. F. Law. Extra prize for hardy flowers: Mr. H. Brownhill, Sale. Highly Commended for Peaches: Mr. Woolmer, Whalley Range.

GARDENING AND FORESTRY EXHIBITION.

JULY 12.—A show of Roses, fruit, Carnations, &c., was held at Earl's Court, on the above date. Roses were not numerous, some of the classes having no entry, and most of the others exhibiting, but little competition. Fruit, on the other hand, was largely shown, and of excellent quality. Carnations and Picotees were present in fair quantity, and miscellaneous exhibits were large and good.

Mr. Charles Turner, Royal Nurseries, Slough, took 1st for forty-eight distinct Roses, in triplets, with a very fair lot, but our space will not allow us to give varieties. The Crimson Rambler, we noticed, was included in this collection. The whole of them were very fresh-looking.

Messrs. Paul & Son, Cheshunt, were the only competitors for forty-eight distinct, single trusses, but their exhibit was a very creditable one.

For twenty-four, distinct, three trusses of each, the most successful exhibitors were Messrs. D. Prior & Son, Colchester, the flowers in this case being a little smaller than those of Mr. Turner, but equally fresh-looking. The same exhibitors were successful in the class for twenty-four single trusses, with good specimens, as also for twenty-four single blooms of Teas and Noisettes. Mr. Geo. Mount was awarded a 1st prize for the best eighteen Teas and Noisettes.

A nice lot of garden Roses from Messrs. Paul & Son, The Old Nurseries, Cheshunt, was the only lot entered for the twenty-four bunches.

In the amateur section, Mr. A. Gibson, gr. to T. T. Burnaby Atkins, Esq., Halstead Place, Sevenoaks, was 1st, for twelve H.P., distinct, single trusses; his Mdle. Marie Rady was first-class.

The best twelve Teas and Noisettes came from Mr. James Parker, Oakfield, Hitchin, Herts; the other classes for Roses failed to obtain entries.

In an open class for twelve bunches of stove and greenhouse flowers, Mr. J. Prewett, Swiss Nursery, Hammermith, staged a capital lot of choice flowers. Larger bunches prettily staged were from Mr. Geo. Wythes, gr. to the Duke of Northumberland, Syon House, Brentford, and obtained a 1st prize also. Mr. A. Gibson, who was 2nd, had a first class collection.

CARNATIONS AND PICOTEEES, &c.

For twenty-four Carnations, of not fewer than twelve dissimilar varieties, the 1st prize went to Mr. M. Rowan, Clapham. The blooms were good, and very evenly flaked.

Mr. G. Chaundry, New Marston, Oxford, was 1st for twelve, with an equally fine collection. Mr. Chas. Turner, Royal Nurseries, Slough, showed very well in the class for twenty-four Picotees; and Mr. F. Hooper, Widcombe, Bath, was 1st for twelve Picotees.

The 1st prize for twenty-four self and fancy Carnations, dissimilar, went to Mr. Chas. Turner, who had large and good blooms; whilst the 1st prize for twelve was won by Mr. Jno. Walker, Thame, Oxon.

Mr. J. Douglas, gr. to Mrs. Whitbourn, Great Gearies, Ilford, Essex, staged the best twelve yellow-ground Picotees; and Mr. Chas. Turner was a good 2nd. A good non-competitive group of bunches of Carnations, staged together with small Palms and Adiantum Ferns, was staged by Mr. Geo. Wythes, gr. at Syon House.

Messrs. Geo. Jackman & Son, Woking Nurseries, Surrey, had a good lot of Roses in cut blooms; and Messrs. J. Cheal & Sons, Crawley, an extensive collection of hardy cut flowers, including a fine show of Violas, Carnations, and a good group of Sweet Peas. Another large collection of hardy cut flowers was from Messrs. Barr & Son, King Street, Covent Garden, W.C., with their usual variety; also a pretty representation of the rock garden, planted with alpine. Mr. H. B. May had an extensive group of greenhouse and stove foliage plants, similar to that staged at Chiswick on the previous day. Mr. G. H. Sage, gr. to the Earl of Dysart, Ham House, Richmond, had a group of hardy herbaceous flowers; and Messrs. Paul & Son, Cheshunt, had a number of Carnations, Cannas, &c. Mr. J. Walker, nurseryman, Thame, Oxon, also contributed a collection of Carnation sprays,

FRUIT.

Fruit was well represented, and most of the classes had a good number of competitors. In the first class, for three bunches of Black Grapes, the 1st place amongst nine exhibitors was taken by Mr. A. Maxim, gr. to the Hon. Miss Shaw Lefevre, Heckfield Place, Winchfield; Mr. T. Osman, Ottershaw Park, Chertsey, was 2nd, with Black Hamburgh; and Mr. F. Jordon, gr. to Birkett Foster, Esq., The Hill, Witley, Surrey, 3rd.

White Grapes were well shown by Mr. W. Lane, King's Ride, Ascot, who was 1st with well-ripened Muscat of Alexandria; Mr. W. Tidy, Stanmore Hall, Great Stanmore, Middlesex, was 2nd, with large bunches of Foster's Seedling, but not quite coloured.

The best three Melons were from Mr. E. Little, gardener to L. M. Rata Esq., Milton Court, Dorking, who had small fruits of Hero of Lockinge. Mr. Samuel Mortimer, Swiss Nursery, Farnham, Surrey, was 2nd.

The 1st prize for one Melon was secured by Mr. T. Elisha, Pelling Place, Old Windsor, for a seedling; and Mr. E. Little was 2nd.

Peaches and Nectarines were numerous, the 1st prize for six fruits in both cases going to Mr. F. Billings, gr. to R. W. Hanbury, Esq., Ilam Hall, Ashbourne, Derbyshire, with Barrington Peach and Lord Napier Nectarine; in both cases they were large, and exceptionally well coloured; Mr. F. J. Debnam was 2nd for Peaches, with fine fruits of Viollette Hative; and Mr. Jno. Wallis, gr. to Ralph Sneyd, Esq., Keele Hall, Newcastle, Staffs, 3rd, with Bellegarde, also good, and of high colour.

The last-named exhibitor was 2nd for Nectarines, with Victoria, large, but not quite ripe; Mr. A. Gibson was 3rd.

There was only one exhibitor for three dishes of Strawberries, and a 1st prize was given to Mr. W. Chuck, gr. to P. Thellusson, Esq., Brodsworth Hall, Doncaster, who was 1st also for the single dish.

Messrs. T. F. Rivera & Son, Sawbridgeworth, had a good collection of fruit, similar to those at Chiswick on the previous day. Grapes as packed for market were well shown by Mr. A. Maxim and Mr. R. Grindrod, Whitfield Gardens, Hereford. Four dishes of Peaches were shown by Mr. T. Elisha, Pelling Place, Old Windsor, also Tomatos, Peas, and Cucumbers. The same exhibitor had four seedling Melons, one of them of very good quality.

Mr. Walter Jinks, gr. to W. Grant, Esq., Fairlawn, Cobham, Surrey, had fifteen dishes of well-grown Tomatos, in as many varieties.

NORTH OF SCOTLAND HORTICULTURAL AND ARBORICULTURAL ASSOCIATION.

IN beautiful weather the members of this Association held their second excursion for the season on Saturday afternoon, July 1. The places visited were the gardens and woods of Durris, Park, and Edgehill, on Deeside. The estate of Durris, which was first inspected, is now owned by Mr. A. R. Baird, and is one of the largest on Deeside, and for natural beauty, especially from an arboricultural point of view, is one of the most interesting in the north of Scotland. The party were conducted by Messrs. Lawson & Reid. Entering by the main drive, attention was at once arrested by healthy and perfect specimens of the finest and rarest Conifers, including *Abies nobilis*, *Abies Nordmanniana*, *Abies grandis*—magnificent specimens—and *Abies lasiocarpa*. A diversity of opinion arose over a variety of pendulous Spruce, about 40 feet high, with long, tendril-like laterals, 5 or 6 feet long, having the appearance of large tooth-brushes. It was named *Abies inverta*, but this did not satisfy some, and further enquiries are being made as to its correct name. One or two specimens were also noticed of *Abies Fraseri*, one of which was fully 40 feet high—probably as fine a specimen as in Scotland. As the company approached the house their attention was drawn to two old English Yews, which may be 500 or 600 years old. It was agreed that if not the largest, these Yews must be amongst the oldest in the country. The garden in front of the house is laid out with great taste. The party were conducted to the famous *Abies nobilis* avenue, planted by the late proprietor, Mr. Mactier, as a screen to a new approach then proposed to be made. The appearance of this avenue is probably the most unique in Scotland. The trees are planted at a good distance apart, and between each on one side are Limes, and on the other Spanish Chestnuts. At the west end of the avenue the *Abies nobilis* are alternated with Weep-

ing Birch, and the effect of the whole is striking. After a hurried run through the gardens, the party wended their way up a part of the west approach, where were numerous fine specimens of *Tauca Mertensiana*, *Tauca canadensis*, *Abies magnifica*, *Sequoia gigantea*, and another beautiful specimen pendulous Spruce, distinctly different from the one in the main drive before referred to. The company were conducted to an avenue, where they saw the most interesting sight of the day, viz., grand specimens of *Sequoia gigantea*, *Abies Douglasii*, and *Tauca Mertensiana*, and a view of much beauty from the Ivy-bridge. Perhaps the finest specimens seen during the day was on the heathery knoll above this bridge, viz., a specimen of *Abies lasiocarpa* (? *Lowiana*), probably the finest in Scotland. The estate nursery was then visited, and the party were shown many seedling beds of *Pseudotsuga Douglasii*, probably 1,000,000, grown from seeds gathered on the estate. Many thousands of *Abies nobilis*, ranging from 2½ to 4 feet high, were here lined out.

NORTH OF SCOTLAND APIARIAN.

The prize schedule of this Society has now been issued. There are twenty classes, with fifty-three prizes, including ten specials for ladies. The Highland and Agricultural Society presents two Silver Medals for the neatest and best display of honey, and the best collection of hives and bee furniture respectively. An attractive feature of the exhibition, which is to be held within the show enclosure of the Royal Horticultural Society of Aberdeen on August 17, 18, and 19 next, will be a bee-driving competition. The schedule may be had from the Secretary, Mr. A. M. Byres, C.A., Bridge Street, Aberdeen.

MARKETS.

COVENT GARDEN, July 13.

[We cannot accept any editorial responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day. Ed.]

MARKET well supplied, with a brisk trade doing. Large supplies of Grapes; more than equal to the demand. *James Webber, Wholesale Apple Market.*

POTATOES.

Our markets are now being rather better supplied with home-grown produce. The Scotch tubers also have made their appearance, and these are very good in size and quality, but are not mature, the skin being rather tender for travelling long distances loose in a truck. Prices:—English, £5 to £8 Scotch, £5 10s. to £6 10s.; Jersey and French, £5 to £7; J. B. Thomas.

HAY.

Averages.—The following are the averages of the prices at the principal metropolitan markets during the past week:—Clover, prime, 135s. to 160s.; do., inferior, 105s. to 120s.; hay, best, 135s. to 160s.; do., inferior, 105s. to 120s.; and straw, 38s to 50s. per load.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

NOTICES TO CORRESPONDENTS.

BONES: J. H. J. The quickest method of dissolving bones is to place them in a cement, stone, or slate tank, and to pour sulphuric acid over them.

BOOKS: X. Oliver's *Lessons in Elementary Botany* (Macmillan), or *Masters' Botany for Beginners, and Plant Life* (Bradbury, Agnew & Co.)—D. E. Ed. Newman's *Illustrated Natural History of British Moths*. It was published by W. Tweedie, 337, Strand, in 1869.

CARNATIONS: Sent in Tin Box. The flake variety, No. 3, has several equals in colour, but we know nothing of its habit, vigour, or weakness of growth, or if it is free. The others are no better than existing varieties, and good only for the borders.

CHRYSANTHEMUM: *J. D.* The leaves are very robust, and it would seem that manure-water or other had been afforded them in excess. Why one suffers and another escapes may be due to better drainage and greater leaf surface, or to some more resisting power in those varieties that are unaffected. There is no fungus.—*T. J. A.* The plants have not recovered from the stopping of the shoots, the hot weather exercising an injurious effect on them after the operation; moreover, the stopping has been very severe. Get the plants to grow freely, and do not be lavish in the use of manures, of which you may know nothing as regards their constituents.

CRACKING OF PEARS: *Munches.* This is due to the action of a fungus, *Fusicladium pirinum*. Try the Bordeaux Mixture, it may prevent the fungus spreading to sound fruits.

CUCUMBERS: *T. W. W., Hants.* The appearance of the leaves sent, and your account of the symptoms of ill-health, show that the plants are suffering from an invasion of eel-worms. Kindly send up some roots, fruit, &c., from the worst plants for inspection.

FLY ON ORCHIDS: *J. B. M.* Can you send specimens for examination?

FUCHSIA: *W. J.* The plants have, we fear, been crippled at the points of the shoots by insects—probably red-spider or thrip, although none was observed on those sent.

FUNGUS ON TUBER OF ANEMONE HORTENSIS: *W. A. C.* Reference to the *Gardeners' Chronicle*, May 28, 1887, p. 712, will show that a certain *Peziza*, now called *Sclerotinia tuberosa*, is often to be found amongst plants of *Anemone*, with the stems of the fungus rising out of black masses of sclerotium, in form and size just resembling the rhizomes of *Anemone*. It has been contended that these black bodies are not independent organisms, but veritable rhizomes, converted into masses of fungus mycelium, called from their compact nature, sclerotium. The conversion taking place in manner analogous to the conversion of the ovaries of grasses into ergot. This view is opposed by some mycologists, who contend that the masses of sclerotium resemble the rhizomes in size and form only, and are not developed from them. Our own opinion is in favour of the former interpretation, which is supported by some *Anemone* rhizomes now sent to us for examination. In this case they are invested with a white mycelium, which entirely absorbs the vigour of the rhizomes; and it appears feasible to suppose that the investment heralds the absorption of the whole cellular interior of the rhizomes, and its replacement by a more compact intermediate fungus stratum, which eventually gives rise to the *Peziza* figured at the above place. Direct evidence of the truth of this theory may be obtained by permitting the transformation to proceed, and watching for the advent of the mature fungus in the *Anemone* bed, after a period of rest. The whole subject of the development of perfect fungi, Hymenomycetal, and Ascomycetal, from forms of sclerotium, has received considerable attention of late years, and the presumption is strongly in favour of the sclerotia being developed at the expense of the absorbed tissue in the rhizomes of *Anemone*. *M. C. C.*

GRAPES: *Subscriber, Worksop.* To ensure the setting of the flowers next season, it would be advisable to procure pollen from some free-setting variety—Sweetwater, Black Hamburg, or other, and use this by means of a camel's-hair pencil or hare's-foot, just after the flowers of the shy-setter have opened. It is certainly unnecessary to keep a mulch of manure on the viney the year round—in fact, unless the soil is very light, it would be better to employ a very light mulch in the summer, heavy mulches tending to keep the ground too cool for the roots of the Vine.

GRAPES: *G. S.* The "spot," *Glaeosporium laticolor*, figured in a recent number of the *Gardeners' Chronicle*.

NAMES OF FRUIT: *G. S.* Mitchelson's Plum.

NAMES OF PLANTS: *W. I.* *Kalmia angustifolia*; 2, *Liriodendron tulipiferum*, Tulip tree; 3, *Apium graveolens*, wild Celery; 4, *Lychnis alba*, double; 5, *Alstromeria*, garden variety; 6, *Eryngium alpinum*.—*J. Wakeham.* *Fraxinus Ornus*.—*J. T. L.* *Lomatia ferruginea*.—*Robt. Owen.* *Stigmaphyllon littorale*, an ornamental climber, figured in the *Botanical Magazine*, t. 6223.—*R. H. S.* *Campa-*

nula latifolia, two forms.—*E. D. L.* 1, *Rubus odoratus*; 2, *Calamintha grandiflora*; 3, *Lysimachia stricta*; 4, *Eriogonum umbellatum*; 5, *Silene Saxifraga*.—*W. M. Jones.* 1, *Avena flavescens*; 2, *Arrhenatherum avenaceum*; 3, *Lolium temulentum*; 4, *Bromus sterilis*; 5, *Aira cæspitosa*; 6, *Agrostis alba*; 7, *Carex cæspitosa*; 8, *Carduus lanceolatus*; 9, *Bromus mollis*; 10, *Carduus nutans*; 11, *C. arvensis*; 12, *C. palustris*; 13, *Crepis virens*; 14, *Daucus Carota*; 15, *Vicia cracca*; 16, *Heracleum Sphondylium*. Another time send six only; our time and space are precious, and the plants you send are of little horticultural interest. *H. E., Christchurch.* *Cattleya labiata* Gaskelliana is one of the most variable forms of the type. Your No. 1 is a pretty light form, and not common; 2 and 3 are ordinary varieties; 4 is *Lælia crispata*, often called *Cattleya crispata* in gardens. Your golden *Adiantum* is a very singular plant.—*G. Cooper.* *Olea fragrans* and *Phyllanthus niveus variegatus*.—*R. B.* 1, *Labellia*; 2, *Alonsoa nicaia*; 3, *Lonicera fragrantissima*; 4, *Agrostemma coronaria*.—*H. Pollard.* 1, *Davallia canariensis*; 2, *Aspidium coriaceum*; 3, *Asplenium bulbiferum*, barren frond; 4, *A. bulbiferum*, fertile frond.

PEACH MILDEW: *M. M.* The gumming is due to the attack of Peach mildew (see fig. 17).

FIG. 17.—PEACH MILDEW HIGHLY MAGNIFIED.
A, B, C, hairs of the Peach; D—H, the fungus in various stages.

PEACH TREES FAILING TO SET THEIR FLOWERS IN PEACHERY: *K. Y. Z.* The trees require lifting and replanting in a border of new materials, and as you say the trees are large and healthy, it is worth the labour involved. Make early preparations, and lift the trees when the foliage is fully matured.

PELAGONIUMS: *Reader.* We cannot undertake to name florist's varieties.

PRUNUS PISSARDI FRUITS: *J. G.* The fruits are rather acid, but, like those of *Prunus Myrobalana*, which come over to this country from abroad, they are fit for tarts, &c.

STANDARD GOOSEBERRIES AND CURRANTS: *A. S.* Sometimes budded or grafted, but more generally raised from cuttings. They can be obtained at the proper season at some of the best nurseries. Price about £1 per dozen, according to age.

SWEET PEA, VARIETY EMILY HENDERSON: *H. L.* It is a good white blossom, and the fragrance, to our thinking, is no stronger than that of any other variety.

VENTILATION: *Thirty Years' Reader.* Provided the houses which you intend to put together are under 10 feet in height, side ventilation may be dispensed with; but we should suppose it to be desirable to have occasional ventilators placed in the brick walls that will form the sides and ends of the collection of houses of greater height than this.

WANTED, a HEAD WORKING GARDENER. Three men under. Personal character required.—Apply by letter to W., Baynards Park, near Horsham.

WANTED, a KITCHEN GARDENER, well up to his work, single or married, no family; age, 25 to 30; cottage found. ALSO, a strong YOUTH, about 18, to clean lamps, windows, look after pony, and work in the garden; lodgings found.—Apply by letter, stating wages and references, to R. POOLE, Walton Oaks, Epsom.

WANTED, a FRUIT-TREE FOREMAN, well experienced in the Propagating and Growing of Fruit Trees for Sale. ALSO, wanted a good BUDDER of Fruit Trees.—Apply to WM PAUL AND SON, Waltham Cross, Herts.

WANTED, a WORKING FOREMAN, in a Gentleman's Garden, near London, where five or six hands are kept. He must be a middle-aged, married man, without family, civil and obliging, who thoroughly understands his business as a Practical Hard-working Gardener (Inside and Out), able to produce a constant supply of Vegetables, Flowers, and Fruit, and to take charge of place when wanted. Wages, £1 per week and lodge. Wife must be a clean, tidy, and domesticated woman (used to service), as she would be employed in the house from time to time, for which she would be paid, in addition to her husband's wages. It is hoped that no one will reply to this advertisement unless the very best personal characters can be produced.—Reply to F. M., 62, Guilford Street, Russell Square, W.C.

WANTED, GENERAL FOREMAN or HEAD WORKING GARDENER.—Thoroughly Experienced in the Culture of Vines, Peaches, Melons, &c., Stove and Greenhouse Plants. Another man kept for outside work. Abstainer preferred. Wages to commence, 25s. per week, no cottage.—Apply, in first instance, B., 35, Weld Road, Birkdale, Southport.

WANTED, a PROPAGATOR and GROWER, well up in Grafting Tea Roses, Clematis, Rhododendron, and General Hard and Soft-wooded Propagating.—State age, experience, and wages to A. X., *Gardeners' Chronicle*, Office, 41, Wellington Street, Strand, W.C.

Rose Grower Wanted.

WANTED, a steady and industrious MAN, who has had experience with Roses. Must be a successful Grafter and Budder, and competent to execute orders.—Apply, stating age, where last employed, wages expected, &c., to JNO. JEFFERIES AND SON, Royal Nurseries, Cirencester.

WANTED MAN and WIFE; Ages 40 to 50, without family, to live in the house in an Eastern Suburb of London. The man is required to Manage a Small Garden and Greenhouse (no Kitchen Garden), and to make himself generally useful; the wife to act as a good plain Cook. The family consists of two ladies. Wages to begin at £10 a year, all found, except beer. Address, F. R. S., *Gardeners' Chronicle* Office, Wellington Street, Strand, W.C.

WANTED, a young MAN, about 22 years of age, experienced in Orchard Cultivation, for a Private Establishment.—State full particulars and wages required, to B. S. WILLIAMS AND SON, Victoria and Paradise Nurseries, Upper Holloway, N.

WANTED, a MAN, well up in House and Table Decorations.—Apply, with full particulars, to G. H. M'YOCK, Luton Hoo Gardens, Beds.

WANTED, a smart active young MAN, for Outside, one who has been used to Kitchen Gardening and General Outside Work.—Apply by letter, stating age, wages required, and full particulars, to C. W. FINCKEN, Esq., Hoyland Hall, near Barnsley.

WANTED, a good HEDGEGER; also a ROUGH CARPENTER, for Fencing, Gate-making, &c.—Apply, A. D. WEBSTER, Park Farm Office, Woburn, Bedfordshire.

WANTED, a quick, intelligent young MAN, under 20 years of age, as IMPROVER in the Office.—To a deserving youth, the situation will be good and permanent.—Apply, in own handwriting, with references, all particulars, and wages expected, to F. SANDER AND CO., St. Albans.

WANTED, a strong, respectable BOY of 17, in the Gardens, Stanmore Park. He must Mow well with Scythe and Machine. To live in the house. Wages £14, all found.—Mrs. KEMBALL COOK, Stanmore Park, Middlesex.

WANTED, August 1, a good COUNTER HAND. Wages to commence at 21s. per week.—Apply, by letter, with full particulars, to B., 13, King Street, Covent Garden, London, W.C.

WANTED, an INVOICE CLERK, in a Wholesale Seed House. Good and quick writer.—Apply by letter to ALPHA, Messrs. Nutting & Sons, Seed Merchants, 1-6, Southwark Street, London, S.E.

WANTED for Fruit and Flower business, young LADY to take charge of shop; must be of good address and well skilled in wreath-making, &c. Apply, giving age, experience, and references, to JOHN MARSH, Farmers' Stores, Warrington.

WANT PLACES.

TO GARDENERS AND OTHERS SEEKING SITUATIONS.

Advertisers are cautioned against having letters addressed to initials at Post-offices, as all Letters so addressed are opened by the authorities and returned to the sender.

The pressure upon our space at this season of the year is so great, we are compelled to state that advertisements received after 6 P.M. on Wednesday will, in all probability, be held over to the next week.

Gardeners, Farm-Bailiffs, Foresters, &c.

DICKSONS, Royal Nurseries, Chester, are always in a position to RECOMMEND MEN of the highest respectability, and thoroughly practical at their business. All particulars on application. Telegraphic and Postal Address—"DICKSONS CHESTER."

F. SANDER AND CO. can recommend several highly qualified and energetic HEAD and UNDER GARDENERS, of excellent character, and proved ability; men thoroughly fitted for all the various duties of their profession. For all particulars, please apply to—F. SANDER AND CO., St. Albans.

RICHARD SMITH AND CO. beg to announce that they are constantly receiving applications from Gardeners seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

TECHNICAL EDUCATION IN HORTICULTURE.—The Advertiser having completed his engagement with the Norfolk County Council, is open to give further courses in Horticulture. Numerous Testimonials and Press Notices can be furnished.—THOMAS BUNYARD, 40, Warrior Square, St. Leonard's-on-Sea.

MR. ALFRED LODGE, who has recently resigned Charge of Brougham Hall Gardens, Penrith, after sixteen years' service, begs to announce that he is now open for an engagement. He is thoroughly qualified in every branch of the profession, and can produce most excellent testimonials. Married, no family; life abstainer.—Address, Chburn, Penrith.

GARDENER (HEAD), in a good establishment.—Age 35, married, no family; twenty-four years' experience in all branches, also Landscape Work. Well recommended.—F. ALLARD, West Malvern, Worcestershire.

GARDENER (HEAD).—Age 44, married. Long practical experience in the Management of good Establishments.—Highest references, and ten years' character from last employer.—H. COOK, Lincoln Road, Dorking.

GARDENER (HEAD), where three or more are kept.—Age 40, married, no family; thoroughly practical in all branches. Life experience. Good references from present and previous employers.—W., 48, Oakfield Road, Fenge.

GARDENER (HEAD); age 29.—Mr. J. SIMMS, Gardener and Bailiff, Kingswood Lodge, can strongly recommend a good practical all-round man as above. Good references.—UNDERY, Kingswood Lodge, Englefield Green, Surrey.

GARDENER (HEAD), or GARDENER and BAILIFF.—Thoroughly conversant with every Department of Gardening; also Farm and Estate. Twenty years' experience; highly recommended.—W. M. GEDDES, Thrumpton Hall, Derby.

GARDENER (HEAD WORKING); age 30; twelve years' experience in good Gardens. Good references.—W. L., 5, Little Elm Place, Fulham Road, London, S.W.

GARDENER (HEAD WORKING).—Age 28, single; fourteen years' practical experience both Inside and Out, in large establishments. Good character.—GARDENER, 3, Grove Terrace, Church End, Finchley, N.

GARDENER (HEAD WORKING); age 26, married.—Mr. LOUTH, gardener to G. R. Burness, Esq., Lyndale Park, Faversham, will be pleased to recommend DAVID SAVAGE to any Lady or Gentleman requiring a good experienced and trustworthy man.

GARDENER (HEAD WORKING).—Age 42, married, no family; experienced in Vines, Cucumbers, Melons, Tomatoes, Mushrooms, Stove and Greenhouse Plants, Fruit, Flower, and Kitchen Gardens, Early and Late Forcing. Twenty-five years' experience, seventeen as Head. Good references.—F. PAY, Hawks Hill, Bourne End, Maidenhead, Berks.

GARDENER (HEAD WORKING).—Age 27, married when suited; fourteen years' experience. Thoroughly up in all branches, Fruits, Flowers, and Vegetables, also first-class Rose Grower, and Staging for Exhibition. Can be highly recommended.—HENRY WELLER, 1, Alpha Cottage, Feltham Hill Road, Ashford, Middlesex.

GARDENER (HEAD WORKING).—Age 33, married, small family; twenty years' good all-round experience. Three years' character.—W. Howard, 4, Achilles Road, West Hampstead, N.W.

GARDENER (HEAD WORKING).—Age 31. Single at present; experienced in Vines, Melons, Cucumbers, Stove and Greenhouse, Flower and Kitchen Garden. Two years' good character from previous employer.—A. NEAL, Hambleton, Godalming, Surrey.

GARDENER (HEAD WORKING) where more are kept.—Middle Age, Married, no Family; Life Experience. Forcing Grapes, Peaches, Melons, Cucumber, Stove, Greenhouse Plants, Flower, Kitchen Garden. Good Personal Character.—A. B., 1, Vine Cottage, Sunninghill Village, Ascot, Berks.

GARDENER (HEAD WORKING).—Age 29, married, no family; well up in Orchids, Stove and Greenhouse, and Fruit, and Table Decoration. Would suit where chiefly Glass. Good characters.—M. B., 6, Brigstock Parade, Thornton Heath.

GARDENER (HEAD WORKING).—Age 48, single; would be pleased to engage with any Lady or Gentleman, where a good practical man is required to grow both Early and Late Fruits, Vegetables, and Flowers; very successful with Grapes and Peaches. Good Testimonials, with good Reference also.—A. G., 3, Grove Terrace, Churchend, Finchley, Middlesex.

GARDENER (HEAD WORKING).—Fourteen years' experience in Greenhouse and Stove Plants, Fruit, Flower and Kitchen Gardens. Excellent character.—WELLS, Mr. Davis, Bridge House, South Streatham, S.W.

GARDENER (HEAD WORKING).—Age 32. Seventeen years' practical experience in all branches of the profession. Can be well recommended as to character and abilities.—H. J. H., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

GARDENER (HEAD WORKING), or ORCHID GROWER.—Married, no family; strongly recommended by late employer. Understands the Cultivation of Orchids and Hybridising same; also understands Stove and Greenhouse Plants, Fruit, Flowers, and Kitchen Garden, Early and Late Forcing.—C., Mr. May, The Lodge, Oakfield, Eden Park, Beckenham.

GARDENER (HEAD WORKING).—Age 32, married. Experienced in all branches, under Glass and Outside. Good character as Head, personal if desired.—W. H., 363, King Street, Hammersmith, W.

GARDENER (HEAD WORKING).—Age 32; practical knowledge of every branch of the profession. Understands all the requirements of Gentlemen's Gardens, and the management of men. Excellent references.—S. B., Park Gate Gardens, Warring, Hastings.

GARDENER (HEAD), or FOREMAN (GENERAL), in a large Establishment.—Age 31, married; high references.—W. E., Cotswold Lodge, Hencroft Street, Slough.

GARDENER (HEAD, or good SINGLE-HANDED).—Age 25, married; twelve years' experience in good places.—H. SMITH, 3, Frith Road, Croydon.

GARDENER (HEAD, or good SINGLE-HANDED).—Age 30. Recommended as a good and competent Gardener. Character will bear strictest investigation.—A. BOOKER, 59, Ringford Road, West Hill, Wandsworth, S.W.

GARDENER (SINGLE-HANDED, or SECOND).—Age 27, married. Good references.—H. LANE, 4, Castle Place, Wellington Road, Hounslow.

GARDENER (SINGLE-HANDED), or where Two are kept; aged 26, single.—Experienced in Greenhouse, Flower, and Kitchen Garden. Fourteen years' experience. Good character.—The Lodge, Addington Park, Croydon, Surrey.

GARDENER (SINGLE-HANDED).—Cow or Pony not objected to, or to look after Cows and assist in Garden. Good references.—W., Mr. C. Webb's, Calworth, Banbury, Oxon.

GARDENER (SINGLE-HANDED).—Age 23, single; has a good knowledge of Stove, Tomatoes, Melons, Grapes, Greenhouse, Flower, and Kitchen Garden; from large establishment; good references.—GARDENER, Arkley Hall, High Barnet, Herts.

GARDENER (SINGLE-HANDED).—Age 26, married when suited; well recommended by Mr. Hill, Head Gardener.—H. D., 32, South Croxted Road, West Dulwich, S.E.

GARDENER (SINGLE-HANDED).—Age 24, single. Lifetime experience in Flowers, Fruit, Vegetables, &c. No objection to make himself useful in any other way, if required. Good references; state wages.—E. G., 1, College Terrace, Church End, Finchley.

GARDENER.—Has had charge of Large Gardens; experienced in Flowers and Fruit under Glass, wishes permanent employment as Head Gardener. Highest references.—G. S., Hertable, Kent.

GARDENER; aged 42. Four children.—A GENTLEMAN wishes to find a situation for his late gardener, two-and-a-half years' character.—W. E. TALLENTS, Esq., Carlton-on-Trent, Newark.

GARDENER.—A Lady recommends her Gardener. Has been in present situation for many years. Thoroughly understands Conservatories, Stoves, Peach, Melon-houses.—Box 10, B. WHEELER, Manchester.

GARDENER (SECOND), where three or more are kept.—Age 24. Twelve years' experience; good characters from past employers.—G. L., 121, Shardeloes Road, New Cross, S.E.

GARDENER (SECOND), where four or more are kept.—Age 24; well experienced, Inside and Out. Mr. GIBSON will recommend a young man as above.—A. STREET, Greenlane, Ampfield, Romsey.

GARDENER (SECOND), in a Private Establishment.—Age 25, married; well experienced, both Inside and Out. Three years' good character from last place. Disengaged. Total abstainer.—L. PLAW, Hascombe, near Godshing, Surrey.

GARDENER (SECOND, or SINGLE-HANDED).—Nine years' character.—W. HORN, Warrea Farm, Kingswood, Epsom.

GARDENER (SECOND).—Age 26; twelve years' good character from excellent situations. Thoroughly experienced Inside and Out.—S. B., 5, High Street, Swanley Junction, Kent.

GARDENER (UNDER), where two or three are kept.—Inside and Out. Good reference. Bothy preferred.—W. J. BRITAIN, 2, Britwell Cottages, Burgham, Bucks.

GARDENER (UNDER).—Age 21, single; seeks a situation in Kitchen and Flower Garden. Good experience. Good character. State wages.—K., Post Office, Faygate.

GARDENER (UNDER).—Mr. THOMSON, Gardener, Easneye Park, Ware, Herts, can recommend a young man (age 22) for Inside or Inside and Out. Nine years' good experience.

GARDENER (UNDER), Inside or Out.—Mr. T. BRIDGWATER, Aston House Gardens, Stevenage, Herts, will be pleased to recommend H. Raines, who has been with him two years, as above.

GARDENER (UNDER); age 20.—The Advertiser is desirous of obtaining a situation in a good establishment, where he would be able to improve himself, both under Glass and Outside. Nearly three years in present situation. Can be highly recommended by present employer. Bothy preferred.—A. S., Carshalton House, Surrey.

GARDENER (THIRD, or otherwise).—Age 23; eight years Inside and Out. Three years' excellent recommendation. Near London preferred.—A. HUNTLEY, 15, Prince's Road, Kingston-on-Thames.

GARDENER and COACHMAN.—Willing to be useful; age 35, married. Five years' first-class character.—JAMES BISHOP, 53, Burrell Road, West Hampstead.

GARDENER and GROOM.—Age 31, married; good driver; thoroughly understands Poultry and Milking; good character and reference.—E. C., 8, Castle Street, Aylesbury, Bucks.

GARDENER and HANDY MAN (SINGLE-HANDED or otherwise), excellent personal character from last employer.—G., 24, Elspeth Road, Lavender Hill, S.W.

MANAGER, or FOREMAN.—Age 28; Vines, Tomatos, Cucumbers, Plants, Cut Flowers, Ferns, &c.—H. M., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

MANAGER, SALESMAN, or FOREMAN GROWER.—Age 38; well up in all branches of the Trade, Fruit, Flowers, Wreaths, &c.—PALMER, 108, Bollingbrook Grove, Wandsworth Common, S.W.

MANAGER, or FOREMAN.—Some years Manager of a large London Nursery. Experienced in all branches of Horticulture. Also well up in taking Contracts for laying out new grounds, &c. Would travel if required.—C. H. C., 22, Lower Lawn Road, Hampstead, N.W.

TO THE TRADE.—MANAGER, FOREMAN and SALESMAN, age 30, single; fifteen years' experience in all branches. Could take Journey. First-class references.—J. WINNER, Brookside, Ascot, Berks.

ROSE GROWER.—Inside or Out, either for Exhibition or otherwise. Has been twelve years Rose Foreman to Messrs. Jno. Jefferies & Son, Royal Nurseries, Cirencester.—A. CONEY, 42, Watermoor Road, Cirencester.

ROSE GROWER, or PROPAGATOR of Hardy Trees, Shrubs, Conifers, Clematis, &c. Has been twelve years Foreman to Mr. Prince, Oxford, and understands Seedling Briar and all other Rose Stocks.—S. C. LEY, Longworth, Faringdon, Berks.

To Nurserymen.

COLLECTOR OF RENTS in the Country.—Age 33 years; fourteen years' character. Highest references; security if necessary.—X. O., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

REAPING and SOWING are the two most important periods in the life of the farmer, and granting that all circumstances are favourable, he naturally during the latter period, hopes to get an adequate return for his labour. As he sows, he expects to reap, and unless constant industry has been exercised, the harvest is generally a poor one. So it is with regard to health, if we are not constantly on the watch and destroy the germs of disease as soon as they are discerned, the body becomes weakened, and at last is unable longer to resist the attacks of the enemy. Holloway's Pills destroy even the most minute traces of disease by purifying the blood and strengthening the system.

"GARDENERS' CHRONICLE."

LARGELY INCREASED CIRCULATION.

IMPORTANT TO ADVERTISERS.—The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper, increased to the extent of 75 per cent.

Advertisers are reminded that the "Chronicle" circulates among COUNTRY GENTLEMEN AND ALL CLASSES OF GARDENERS AND GARDEN-LOVERS at home and abroad, and is preserved for reference in all the principal Libraries.

ADVERTISERS will greatly assist our efforts to get to Press earlier, by forwarding their favours as EARLY IN THE WEEK as possible.

STRAWBERRY PLANTS.—During the drought we were favoured with 3 inches of rain, consequently our plants are green, and growing almost as fine as usual. Catalogue, post free, of all the best kinds. New varieties are very strong. Special prices for large quantities. Col. BROCKMAN, Dodsley, Midhurst, says:—"The Strawberries supplied by you are giving splendid results." H. CANNELL AND SONS, Swanley, Kent.

ODONTOGLOSSUMS, Cattleyas, Cypripediums, &c., 1s. each. Lists free. Try our "Basket-pots." Improved Orchid Baskets, Cylinders, &c. Samples three stamps each, free.—The "Shilling Orchid" Co., 131, Albion St., Leeds.

For Present Sowing.

SUTTON'S FLOWER OF SPRING CABBAGE
S.—The best Cabbage for Autumn Sowing. Comes very early in spring, produces finer heads than other autumn-sown Cabbages, and shows no disposition to run to seed. W. H. Gumble, Esq., Great Yarmouth, says:—"Your Flower of Spring became a Cabbage when other varieties were little better than greens."
Price of Seed, 1s. per ounce, post-free.

SUTTONS' SEEDS GENUINE ONLY DIRECT FROM
SUTTON AND SONS, THE QUEEN'S SEEDSMEN, READING.

DAFFODILS for the MILLION.—Hartland's famous Irish-grown Bulbs now harvested. "LITTLE BUCK," with exceedingly low prices, post-free.—HARTLAND, F.R.H.S., Seedsmen, Cork, Ireland. (Established, 1810).

Sow now for early flowering in Spring.
ROEMER'S SUPERB PRIZE PANSIES.
R.—The finest strain of Pansies in the World. (See) Introducer and Grower of all the leading Novelties. CATALOGUE, free on application.

Elm, Cambridgeshire.

VALUABLE ORCHARD LAND FOR SALE.

MESSRS. MAXEY AND SON have received instructions to **SELL BY AUCTION**, at the "White Hart" Hotel, in Wisbech, on **THURSDAY**, August 3, 1893, at 7 o'clock in the evening precisely, a very valuable **ORCHARD** and **FRUIT GARDEN**, situate in the village of Elm, about 2 miles from the Market Town of Wisbech, and in the midst of one of the finest fruit-growing districts in that neighbourhood. The property comprises in all 28 a. 0 r. 35 p. of extremely valuable land (the soil being of the richest quality, and especially adapted for the cultivation of Strawberries), together with a commodious brick and thatched Farmhouse, with large Barn, Granary, Stables, and other outbuildings.

Possession will be given at Michaelmas next.
Particulars, Plans, and Conditions of Sale can be obtained on application to the Auctioneers, South Brink Place, Wisbech; or to **BOTSFORD AND KING**, Solicitors, 10, Market Street, Wisbech.

City of Peterborough.

TO NURSERYMEN, FLORISTS, SEEDSMEN, AND OTHERS.

TO BE LET, with immediate or Michaelmas Possession, the well-known, old-established Peterborough **BUSINESS**, comprising a **NURSERY FARM** of 25 acres, of which 13 acres are under cultivation, not heavily stocked; the remainder in Pasture Land, with good House and Premises, Greenhouse, Pits, &c., adjoining the Town. Also, a superior **SEED SHOP** and **STORE**, in a first class central position; and a **FLOWER STAND** on the Great Northern Railway Station. The whole Business has for many years been carried on by Mr. John House, who is retiring on account of declining health, and leaving a fine opportunity for an enterprising tradesman.
Apply, **FOX AND VERGETTE**, Estate Agents, Peterborough.

TO NURSERYMEN.—Lease and Goodwill of a capital **NURSERY GROUND** for **SALE**. A Bargain. Covering an area of 2 acres, adjoining Station in high class neighbourhood, North of London. Owner retiring in consequence of ill-health. Six Greenhouses on ground. Lease, 21 years. Rent, £75, nearly half let off. Premium, £200.
Apply to Messrs. **HARMAN BROS.**, 75, Aldermanbury, Guildhall, E.C.

FOR SALE, a Small NURSERY and SEED BUSINESS. Good position on a main road, in a fashionable Watering-place. Good Dwelling-house, Show-house, and Large Garden. Rent low. Income moderate.
Apply for full particulars, by letter, to W., Mr. Pearman, Salmons, Warrington, Surrey.

LONDON, S.W., in main thoroughfare, close to Station. A Bargain for Business People. For **SALE**, in consequence of ill health, the **LEASE** of a prominent **FLORIST'S SHOP**, beautifully fitted up, and nine-roomed Residence, together with the Goodwill. Good trade attached. Lease 69 years.—Apply **PATCHINGS**, News Agent, Putney.

FOR SALE, a good and extensive SEED BUSINESS (Farm, Vegetable, and Flower). Returns, £5000 per annum, with good profits. Satisfactory reasons for selling.—Apply to B., Messrs. Hurst & Son, 152, Houndsditch, London, E.C.

TO BE SOLD, a compact FREEHOLD MARKET NURSERY, situated on a main road, near a fashionable seaside town.—Dwelling-houses, Garden, and 350 feet run of Glass, well-heated; and newly opened. Price for the Freehold and Erections, £1050; and Stock optional. A genuine bargain, for occupation or investment.
Apply, for further particulars, to **HORTOLANS**, 45, Beauchamp Place, Chelsea, London, S.W.

SNUG FLORIST'S BUSINESS FOR DISPOSAL.—250 Feet of Glass, Shed, House, &c. The whole fitted with hot water and well stocked. Rent only £20 per annum. Three years' agreement if desired. Price £50.—Apply **HIGGINS**, Clapton Floral Depot.

PALMS, FERNS, &c.—FERNS in Variety.—**ARALIAS** and **CYPERUS NATALENSIS** in 4's, 6s. per dozen; **LARGE A. CUNEATUM** in 4's, 6s. and 7s. per dozen; **PALMS** in variety, and **FIGUS** in 4's, 12s. per dozen; **PALMS**, fine stuff, in large 60's, 5s. per dozen; **FERNS** and **CYPERUS**, in 2½ inch pots, 12s. per 100. Almost any kind of plants in season supplied at lowest possible prices. Well packed in or out of pots. Free on rail. Cash with order.
LANE AND MARTIN, 227, Brixton Road, London, S.W.

NEW CARNATION (EMPRESS OF INDIA).—A grand new, bright Scarlet Carnation, of very vigorous growth, quite hardy, having stood out in the open all last winter, very free bloomer, many plants carrying now from 60 to 80 blooms and buds of immense size and brilliant colour, none of which burst. This variety is acknowledged by all who have seen it to be the very best for market purposes. Strong plants in pots, 3s. each; 36s. per dozen. Ready in September.
Apply to **J. COBBAN AND SON**, Nurserymen, Florists, &c., Rotherham.

BULBS.—Our special offer of Daffodils, and other Bulbs for early planting, is now ready. **Lilium candidum**, 10s. and 12s. per 100; **Lilium Harrisii**, 5s. to 10s. *ed.* per dozen; **Roman Hyacinths**, 12s. 6d. and 18s. per 100, very scarce; **Narcissus** (paper-white), 5s. per 100; **Narcissus Double Roman**, 5s. per 100; **Gladiolus Colvilli** (The Bride), lovely for cutting, 2s. 6d. per 100; **Iris hispanica** (the poor man's Orchid), finest mixed, 1s. 6d. per 100. Every article the best procurable.
J. R. PEARSON AND SONS, Chilwell Nurseries, Notts.

EARL'S COURT EXHIBITION.
Exhibition of
GARDENING and FORESTRY
THE GARDEN of LONDON.

JULY 26 and 27.

**GREAT SHOW OF ROSES AND FRUIT,
CARNATIONS, PICOTEES, &c.**

Classes (Open and Amateur) for Grapes, Melons,
Peaches, Strawberries, Cherries, &c.

Meritorious Exhibits not named in the Schedule will be
recognised.

Prizes, Medals, and Certificates awarded for every Show.

All applications for entries, schedules, regulations, and fur-
ther information should be addressed to Mr. H. E. MILNER, the
Chairman, at the Offices of the Exhibition, Earl's Court, S.W.

ADMISSION to the Exhibition Building, Flower Show,
and the Central and Western Gardens, 1s.

OPEN DAILY, from 11 A.M. to 11 P.M.
SEASON TICKETS £1 1s.,

To be obtained from the usual Agents and the
Secretary.

**SPECIALITY—
FOLIAGE PLANTS
ICETON'S
LARGE PALMS.
PUTNEY,

DANIELS' DEFIANCE.
The Finest Variety of Cabbage in Cultivation.

It is early, short-legged, and compact, grows rapidly to the
weight of 10 to 15 lb., and is of the most delicious Marrow
flavour. Should be in every Garden. Sow now. Seed, our true
stock, with cultural directions, per ounce, 1s. 6d., post free.

DANIELS BROS.,
Seed Growers and Nurserymen, Norwich.

DANIELS' GOLDEN ROCCA ONION.

The most superb variety in cultivation; of fine globular
form, with golden yellow skin, often grows to the weight of
2 to 3 lb. each, and of a mild, delicate flavour. Splendid for
exhibition. Sow now. Seed, with cultural directions, per
ounce, 2s., post-free.

DANIELS BROS.,
Seed Growers and Nurserymen, Norwich.

PRIMULAS! PRIMULAS! PRIMULAS!
25th year of Distribution.
Williams' superb Strain, 1s. 6d. per dozen; 10s. per 100.
CINERARIAS, same Price; also **DOUBLE WHITE PRIM-
ULAS**, 6d. each. Package and Carriage free for Cash with
Order.—**JOHN STEVENS**, The Nurseries, Coventry.

Seedsmen by Royal Warrants to H.M. the Queen and H.R.H. the Prince of Wales.

WORDSLEY, STOURBRIDGE.

STRAWBERRIES.

ALL MUST HAVE
LAXTON'S "ROYAL SOVEREIGN." (New) 1893.
THREE FIRST-CLASS CERTIFICATES.
An earlier, higher quality & Improved Sir J. Paxton.

I consider this by far the finest early Strawberry yet introduced. Fruit of the largest size, brightest glossy scarlet colour, flavour rich (quite equal to British Queen), ripens with Noble; a splendid cropper and grower, and I consider it to be the long-sought EARLY, HIGH-FLAVOURED & IMPROVED SIR J. PAXTON, a splendid forcer, and in every way worthy of its name. Hand-some coloured plate, now ready, 6d. (gratis to Customers).
Open Ground Runners, £5 per 100; 50, £3; 12, 30s.; 8, 20s.
(Runners, in small pots, 3 price extra).

LAXTON'S No. 1 (New, 1893).

The Earliest of All Strawberries. Unquestionably the earliest in the market preceding May Queen, Ruskin, Black Prince, &c., by some days. Fruit of good size, bright scarlet, firm, and of excellent quality. Very prolific, and of much value where a few days gain is now so important.

Price, Open Ground Runners, 100, £3; 50, £1; 12, 41.
(In small pots, 3 price extra).

LAXTON'S SENSATION (New, 1892).

First-class Certificate Gardening and Forestry Exhibition, May 10, 1893. An enormous second early variety, of good flavour, and probably the largest Strawberry ever introduced. A remarkably strong grower, and producing fruit in wonderful clusters. Will prove a welcome addition to the list of good sorts. Forces splendidly. £2 per 100; 8s. per dozen. (In small pots, 3 price extra). The best varieties of recent introduction.

LAXTON'S SCARLET QUEEN.

First-class Certificate. The best first early—very early. Fine colour and shape, and the richest flavour. Habit strong, a very prolific variety, a splendid early table and market fruit.
Open Ground Runners, 15s. per 100; 3s. dozen.
(In small pots, 3 price extra).

LAXTON'S COMPETITOR.

An excellent, very large, and prolific Strawberry, following closely on the heels of Noble, with a distinct Apricot-like flavour, a wonderful bearer and plant; one of the hardest.
10s. 100; 2s. 6d. dozen. In pots, 21s. 100; 4s. dozen.

LAXTON'S LATEST OF ALL.

The best late Strawberry, and the latest and best late variety. A seedling from British Queen, but much later. Flavour grand.
8s. 100; 2s. dozen. In pots, 21s. 100; 4s. dozen.

- Laxton's Noble, the grandest early, 5s. 100; 1s. 6d. dozen.
- Laxton's Commander, one of the best main crops, 6s. 100; 2s. dozen.
- John Ruskin, a good early hardy variety, 7s. 100; 2s. dozen.
- La France, a fine French variety, F.C.C., 15s. 100; 3s. dozen.

The following best varieties for forcing or early planting, can be supplied STRONG in pots, at once, per 100:—

A. F. Barron	21s.	Competitor	21s.	President	18s.
Nicaise	21s.	Keen's Seedling	15s.	Napier	21s.
British Queen	18s.	King of Earlies	21s.	Laxton	21s.
Dr. Hogg	22 6	Grosse Sucree	18s.	Scarlet Queen	2/6
Jas. Veitch	18s.	Latest of All	21s.	Viscountess	18s.
Ruskin	21s.	Marguerite	21s.	Waterloo	21s.
Commander	21s.	Noble	18s.		

Also strong Open Ground Runners can now be supplied at usual prices, of—Nicaise, Sucree, Vicomtesse, British Queen, Paxton, President, Albert, Captain, King of Earlies, Marguerite, Dr. Moore, Dr. Hogg, Stirling Castle, Sharpless, A. F. Barron, Waterloo, Countess, Jas. Veitch, Under Fritz, Elton Pine, Lucas, Filbert Pie, and all other best sorts, English and Foreign.
(About 200 vars. in stock).

Usual Allowance to the Trade, for Nett Prompt Cash.

DESCRIPTIVE LISTS ON APPLICATION TO

THOMAS LAXTON, Seed Grower, BEDFORD.

THE Gardeners' Chronicle.

SATURDAY, JULY 22, 1893.

HOME-GROWN FRUIT.

THE condition and the prospects of the fruit crops this year will excite unusual interest, owing to the very exceptional season we have passed through. That the conditions last autumn were not unfavourable, was shown by the extraordinary abundance of bloom in the spring. Spring frosts, which are usually so destructive to the hopes of the fruit-grower, were this year conspicuous by their absence—at least, in the south. Then followed a dry hot season, the like of which few of those now living remember. This was not exactly the condition one would consider as propitious to the young-growing fruit, and in point of fact many flowers and embryo fruits did shrivel and drop, whilst grubs and insect pests of various kinds seemed to revel in the heat, and effected a considerable thinning.

In spite of all this—in consequence of this, we suppose we ought to say—the fruit-crop returns are certainly much better than usual. We may refer the reader to other columns for the full details. Here we may be allowed to offer on the part of our readers and ourselves, our hearty thanks to the numerous correspondents in all parts of the kingdom, who have filled in our return-forms. These gentlemen have, for the most part, rendered us a like service for many years, so that their lengthened experience in the same locality goes far to secure an accurate representation of the facts of the case.

At the same time, we are glad to find additional names in additional districts, for the larger the number of observers, and the wider the area of their observations, the more correct is likely to be our Report. The counties have been arranged in districts corresponding to those adopted by the Meteorological Office for agricultural purposes, and are the same as those used in the weather reports published weekly in our columns. Referring the reader to other columns for the full details, we may here briefly summarise the general result.

Commercially speaking, the two most important crops are Apples and Plums. Concerning these crops, our reports are as follows:—

	Apples.		
	Average.	Over.	Under.
Scotland	25	7	14
England and Wales	99	62	39

	Plums.		
	Average.	Over.	Under.
Scotland	18	17	11
England and Wales	66	50	49

So far as other crops are concerned, PEARS are generally reported as above average, and of good quality.

CHERRIES over average, and of good quality.

PEACHES and NECTARINES much over average, and generally of good quality.

SMALL FRUITS, including Gooseberries and Currants, slightly over average.

STRAWBERRIES a fair average, but a very short season.

Budding Season.

WM. PAUL & SON

Respectfully solicit orders for the following first-class NEW ROSES, their introductions of 1893 and 1892, plants of which can now be supplied in pots:—

CORINNA (Tea-scented).—First Prize as the best Seedling Rose at International Horticultural Exhibition, 1892; several First-class Certificates; rosy flesh suffused with tawny copper; distinct and excellent. 1s. 6d. each.

PRINCESS MAY (Hybrid Tea).—Award of Merit R.H.S., Certificate of Merit International Horticultural Exhibition; clear soft opaque pink; an excellent pot Rose, extra fine foliage. 10s. 6d. each.

SPENSER (H.P.).—Three First-class Certificates; fine satin pink, magnificent and effective. 3s. 6d. and 5s. each.

LADY HENRY GROSVENOR (Hybrid Tea).—Award of Merit and First-class Certificate; flesh colour, exceedingly free-flowering. 3s. 6d. and 5s. each.

ZENOBIA (Hybrid Moss).—Soft rose, large and handsome; a fine addition to the Moss Roses. 3s. 6d. each.

CLIMBING QUEEN OF QUEENS (H.P.).—A climbing sport from the pink Rose QUEEN OF QUEENS. 5s. 6d. each.

The New Continental Roses of 1893, 3s. each, 30s. per dozen. 1892, 2s. 21s.

For full descriptions of the above, and particulars of other New Roses, see Descriptive Catalogue, which will be forwarded post-free on application.

N.B.—All other New Roses can be supplied at advertised prices.

A large general Collection of Roses in pots for planting out, climbing, and pot culture, 9s. to 18s. per dozen; extra strong, 24s. to 42s. per dozen.

PAULS' NURSERIES, WALTHAM CROSS, HERTS.

CUTBUSH'S MILL-TRACK MUSHROOM SPAWN.

—Everyone can readily grow Mushrooms, and by using this Spawn will ensure success. All growers speak in high praise of the quality. Numerous Testimonials. None genuine unless in sealed packages, and printed cultural directions enclosed with our signature attached.

Price, 6s. per bushel, 1s. extra for package; or, 1s. per cake, free per Parcel Post.

WM. CUTBUSH & SON, Nurserymen and Seed Merchants, Highgate Nurseries, London, N., and Barnet, Herts.

NUTS.—Filberts about average; in some districts, over. Walnuts average, and good in quality.

On the whole, then, we are justified in chronicling the fruit crop as unusually good.

NEW OR NOTEWORTHY PLANTS.

LILIUM JAPONICUM, *Thunb.*, var. *ALEX-ANDRÆ*, *Hort. Wallace*.*

This fine Lily was shown both by Messrs. Wallace and Veitch at Chiswick last Tuesday, and was given a First-class Certificate of the Royal Horticultural Society. It came from Japan under the name Ukeyuri. Obviously it should be classed amongst the varieties of *L. japonicum*, *Thunb. non Sims* (*L. Kramerii*, *Hook. fil.*). From typical *L. japonicum*, as figured by Elwes (*Monograph*, t. 14) it differs principally by its longer style and broader leaves. *L. Kramerii*, *Hook. fil.*, in *Bot. Mag.*, t. 6058, and *L. Barrianum* are forms of the species, with pale red flowers. *L. japonicum* has been supposed to be a hybrid, but we have now in the Kew herbarium wild specimens gathered by the three different collectors. Elwes considers it likely to be a distinct species, occurring abundantly in some parts of Southern Japan. The plant figured as *japonicum* in the *Botanical Magazine* is a form of what is now called *Brownii*. We only found this out for certain by borrowing from Upsala Thunberg's type specimen.

Bulb like that of *L. longiflorum*. Stem green, glabrous, stiffly erect, 1½ foot long, bearing two to three flowers, which are sometimes horizontal, sometimes suberect when fully expanded. Leaves scattered, lanceolate, dull green above, paler green below, distinctly 3 to 5-nerved, acute, narrowed at the base to a short ascending flattened petiole, the central ones 3 to 4 inches long, by 1 inch broad. Pedicels 1 to 2 inches long, much thickened upwards, sometimes bearing a small linear leaf, but usually naked. Flower openly funnel-shaped, slightly scented, pure white, tinged with green outside towards the base and on the keel of the segments, 5 to 6 inches long, 7 to 8 inches broad when fully expanded, the segments beginning to spread 1½ inch above the base; inner segments oblong, much broader than the outer, 2 inches broad at the middle. Stamens 2 inches shorter than the perianth; anthers linear, dark brown, ½ to ⅔ inch long; pollen dark yellow. Style much over-topping the anthers before they fall. *J. G. Baker, Herbarium, Kew.*

AGLAONEMA ROTUNDUM, *N. E. Br.*, *n. sp.*

Stem about ⅓ of an inch thick, green. Petiole 1 to 1½ inch long, sheathing from ½ to ⅔ of its length, green. Leaf-blade, 3½ to 5 inches long, 3¼ to 4 inches broad; orbicular-ovate or very broadly ovate, subacute, the base rounded, or very shortly and broadly cuneate at the insertion of the petiole, softly coriaceous in texture; midrib flat above, prominent and rounded beneath; primary veins about five on each side of the midrib, three being rather close together at the base, and the other two about 1 inch apart, all strongly curved, impressed above, prominent beneath, the secondary veins scarcely less conspicuous, upper surface shining dark green, with the midrib and sometimes some of the principal veins of a clear bright pink; under surface claret-purple, with greenish mid-rib and rosy-purple veins. Peduncle stout, erect, 2¼ inches long, and about 2½ lines thick, green. Spathe large, abruptly bent forwards, 2½ to 2¾ inches long, 1 to 1¼ inch broad, inflated, cowl-shaped, completely enclosing the spadix, acute, the basal part shortly convolute, light green inside and out. Spadix (including

the short stipes), 1¼ inch long, bent forwards, but not protruding from the broad opening of the spathe; female part ½ inch long and 4 lines thick, the ovaries pale yellowish-white, arranged in 2 or 3 cycles, with white neuter organs above and below them, one-celled with one erect anatropous ovule, stigma discoid; male part very large, 1 to 1½ inch long, ½ inch thick, cylindrical-oblong, obtuse, white.

This is one of the most distinct species of the genus known to me, its roundish ovate leaves, and large—for the size of the plant—inflated hood-like spathe, enclosing the very stout spadix, distinguish it from all others. Horticulturally, the plant will be valued for its glossy-green leaves, set off by their very clearly-defined pink midribs, a kind of coloration that, so far as is known to me, does not occur in any other Aroid. The native country of this plant is not definitely known to me. Messrs. J. Veitch & Sons have it in cultivation, and first sent a specimen of it to Kew in 1889, with the information that they imported it from Calcutta, but did not know its origin; yet I think it is not improbable that it comes from some part of the Malay Peninsula, or

FIG. 18.—*CYPRIPEDIUM × CLINAKERRYANUM*.

one of the islands along its coast. The specimen first sent was too imperfect for description, but as it has recently flowered again with Messrs. Veitch & Sons, who kindly sent a specimen, I am enabled to describe it. *N. E. Brown.*

CYPRIPEDIUM × CLINAKERRYANUM (*PHILIPPINENSE ROEBLENI × CULTISII*).

A single plant of this fine hybrid was raised by Messrs. Pitcher & Manda, the American nurserymen, and acquired by that enthusiastic orchidist, the Hon. Chas. G. Roebing, of Trenton, N.J., U.S.A., who is known the world over as the builder of that marvellous structure, the Brooklyn suspension bridge, and other triumphs of engineering skill. The variety is named by request in honour of his gardener, Mr. Clinakerry, whose fame as an Orchid grower is as well-known here as in the States. A fresh flower received furnished material for the following description: Scape hairy, tinged with rose; ovary reddish on the ribs, green between. Upper sepal white, with about twenty well-defined purple lines reaching to the upper margin, 2½ inches long, 1½ inch broad. Lower sepals together rather

smaller than the upper, greenish-white, with a few faint reddish lines. Staminode nearly orbicular, with a notch or depression in the upper edge. Petals 4 inches long by ½ inch broad, creamy-white, spotted over the entire surface with purplish-crimson. The labellum is large, and partakes much of *C. Curtisii*, especially in the narrow infolded side lobes, and the general helmet-shaped contour, whitish, tinged with dull rose, the darkest portion being the face.

It is a very fine hybrid, well worthy to rank with the best forms of that favourite, *C. × Morgania*. *J. O'B.*

CALADIUM VENOSUM, *N. E. Br.*, *n. sp.*

This, and the following species (*C. rubescens*), are two novelties quite distinct in character from any other *Caladiums* in cultivation, except *C. Schomburgkii*, to which species they are nearly related, but, at the same time, perfectly distinct. They are important horticultural introductions, because of being likely to produce by hybridisation a new race of garden forms of these useful decorative plants; and Messrs. F. Sander & Co., to whom I am indebted for the material from which these descriptions are made, are to be congratulated upon their acquisition, for it is a long time since anything so decidedly different from the ordinary form of *Caladium* has been introduced. They do not appear to be large-growing species, and both are prettily variegated, one with light yellowish-green, the other with crimson. They have been imported from Brazil by Messrs. F. Sander & Co., St. Albans. The following are the descriptions:—

Petioles 8 to 10 inches long, terete, not striate, rather slender, 3 to 4 lines thick at base, pale green, densely covered with black dots and short lines, except towards the apex, giving them a very dusky appearance. Leaf-blade 7 to 10 inches long, 3 to 4½ inches broad at the base, elongate, ovate-deltoid, very slightly peltate or subpeltate at the truncate or very broadly rounded base, with a slight cup-shaped depression at the insertion of the petiole, the basal angles broadly rounded, thence gradually narrowed in a nearly straight line to a very acuminate apex; the nerves are 5 to 8 on each side of the midrib, the one or two inner pairs arising from the midrib much below the middle, all the rest basal, the outer nerves more or less branching, all flat above, very prominent beneath; upper surface dark green, not shining, with the course of the nerves variegated with light yellowish-green, and the margin very narrowly edged with red, the under-side of a uniform glaucous green. Peduncle 6 to 7 inches long, ¼ inch thick, subterete or somewhat flattened on one side; light green, marked on the lower half with short black lines, and dots like the petioles, but not so densely. Spathe 3 to 3½ inches long, the tube 1¼ to 1½ inch long, 9 to 10 lines in diameter, obliquely ovoid, much inflated, light green, with or without a purple blotch at the base inside; the limb 1½ to 2 inches long, erect, convolute in the basal half, only the upper part being open, acuminate, white on both sides; spadix about two-thirds as long as the spathe, sessile; female part ⅔ inch long, stout, conical, the ovaries all united by their summits, yellow, two-celled, with four to six anatropous ovules in each cell; stigma depressed, neuter part about ½ inch long, and the male part about 1¼ inch long, terete-conoid, obtuse. A native of Brazil.

CALADIUM RUBESCENS, *N. E. Br.*, *n. sp.*

Petiole 5 to 6 inches long, 2 lines thick, terete, finely striate, uniform dull blackish, the short sheath whitish densely variegated with blackish. Leaf-blade 5 to 6 inches long, 2 inches broad, elongate ovate-lanceolate, acuminate, margins very wavy, the base rounded or shortly cordate, the basal lobes or auricles ½ to ⅓ inch long, strongly cucullate, with a linear acute sinus between them; nerve five to seven on each side of the midrib, the inner pairs arising from the midrib much below the middle, the rest basal, all flat above, prominent beneath; upper surface with all the central area and nerve crimson, and the borders green, opaque, with a faint glaucous hue overspreading the whole, perhaps more evident on young leaves; under surface coloured like the

* *Lilium japonicum*, *Thunb.*, var. *L. Alexandræ*, *Hort. Wallace*. Bulbo globoso magnitudine mediocri; caule viridi glabro sesquipolali 2-3 floro; foliis sparsis lanceolatis 3-5 nervatis in petiolum brevem attenuatis; pericallis brevibus clavatis; perianthio semipolali late infundibulari albo exlusis viridi fincto segmentis interioribus exterioribus valde latioribus; staminibus perianthio complice brevioribus, antheris brunneis; stylo staminibus superante. (*L. Choisy, Journal of Horticulture*, July 20, 1893.)

upper, but paler and more evidently glaucous, and the blackish colour of the petiole extends a little way along the midrib. Peduncle $3\frac{1}{2}$ to 4 inches long, slender, blackish. Spathe $3\frac{1}{2}$ inches long, the tube 1 inch long, 8 to 9 lines in diameter, obliquely ovoid, inflated, glaucous green, with a blackish stripe on the back that runs from its base to the apex of the limb, which is $2\frac{1}{2}$ inches long, very acuminate and milk-white in colour. Spadix 2 to $2\frac{1}{2}$ inches long; female part $\frac{1}{2}$ inch long, obconic (narrowed towards the base); neuter part about 4 lines long, constricted, male part terete or sub-fusiform obtuse, dull waxy-white. A native of Brazil. *N. E. Brown.*

straw, &c., any roots that may have been met with during the digging, the job of undermining has to be commenced. In doing this, it is best to leave at each corner of the mass of earth, pillars of the same, 1 foot square if the soil be solid, and more if it be loose.

The part dug out from beneath the ball should be such as will leave the mass from $1\frac{1}{2}$ to 2 feet thick. After the middle portion is cut away, and the soil thrown out of the trench, the bottom of the ball being cut level, some stout planks are placed beneath it, and "blocked" up by using bits of thin flooring deal, 8 to 10 inches long, one on the top of the other,

FIG. 19.—A WEEPING ASH READY FOR REMOVAL.

WEEPING ASH TREE READY FOR REMOVAL.

THE illustration given above (fig. 19) shows a tree excavated and undermined, with ball intact, and enclosed with boards, waiting for the trolley or transplanting machine, to take it away to its new station. The method usually followed in the case of large trees which have to be transplanted to a considerable distance, and which involves the use of wheeled carriages of some kind, is to mark out the size of the mass of soil containing the roots—say a square of 3, 4, 5, or 6 feet, as the case may demand—and throw out a trench, with upright walls, on the side next to the roots, and from $2\frac{1}{2}$ to 3 feet broad. This trench must be as deep as the majority of the roots go, and need rarely be more than $3\frac{1}{4}$ feet deep. Having done this, and secured and wrapped in wet

till the planks are fixed close up under the ball. The corner pillars are now cut away, one at a time, and similarly supported.

This being done, a stout beam is placed under the boards so that they all of them rest on it, and the sides surrounded by staves or short boards or stout canvas, and roped tightly. It is now ready for removal, and may be swung by means of chains on a tree-transplanting machine, or removed if it be not very large, by means of a trolley. The machine is best, there being but little disturbance of the ball, and the latter can be lowered on to a set of blocks as before, these being taken out bit by bit until it rests on the boards alone, which can be drawn out one at a time, always carefully plugging with soil, the hole left by drawing out one. The photograph from which our figure was taken was kindly sent by Mr. T. H. Crisp, late gardener to Lord Wimborne, Canford Manor,

KEW NOTES.

Hippeastrum brachyandrum is a large handsome flowered species of the *Habranthus* section, of which very little was known until about three years ago, when Mr. Bartholomew of Reading sent it in flower to Mr. Baker, and subsequently sent seeds of it to Kew. From these a batch of plants were raised which are now planted in an open sunny border outside, and several have already flowered. The flowers, which are produced single on scapes 1 foot long, are erect, 4 inches long, shaped like a *Colchicum speciosum*, and coloured rosy-lilac, deepening to deep crimson at the base. The leaves are linear, 1 foot or so long, and the bulb is egg-shaped. A promising plant for a sunny bed outside in summer; a good companion for *Zephyranthes carinata*.

Sansevieria Kirkii.—This plant may now be seen in flower in the Palm-house at Kew. It was originally sent to Kew in 1879, by Sir John Kirk, who had obtained it from the mainland near Zanzibar, and flowered it in his garden at Zanzibar. The longest leaf on the plant sent to Kew measured 9 feet. It has since been largely distributed to the Colonies from Kew as a useful fibre-yielding plant, the report of Messrs. Ide and Christie on specimens submitted to them stating that the fibre was "bright, clean and strong, and in every way a most desirable commercial article. It would compete with the best Sisal hemp for rope-making purposes. Value £30 per ton." As a garden plant this *Sansevieria* is not without value, its stout lanceolate mottled green leaves and large heads of greyish long tubular flowers being attractive.

Faralaya splendida and *Lonchocarpus Barteri*, two strong-growing stove climbers, are in flower on the roof of the Palm-house, and may be seen from the gallery. They are excellent subjects for clothing pillars or gallery-rails in very large plant-houses. *Aristolochia ornithocephala* is another most useful plant for the same purpose, and it flowers most profusely.

Solanum Windlandii and *S. Scaphothianum* are better this year than ever. They are grand plants, the former deserving, in my opinion, to rank with the best dozen stove climbers. *W. W.*

A JOURNEY THROUGH SOUTH FRANCE, ITALY, AND SWITZERLAND.

(Continued from vol. xii., p. 741.)

September 13. At Florence.—Drove to Poggio Gherardo to see Mr. Ross' collection of Orchids, after breakfast. They are grown over tanks of water in shaded glasshouses, and we were surprised to find their temperature as much as 10° cooler than it was outside at mid-day.

September 11. — Visited botanical gardens at Florence, famous from the days of Micheli, 150 years or so ago. The oldest tree in the garden is a venerable Yew, said to have existed here since the garden was founded by the ancient Apothecary's Society of Florence. It is 50 feet high, its lower branches sweeping the ground. Here is also a fine Cork Oak (*Quercus suber*), with a clear stem of 20 feet, and at its thickest diameter the bole is 3 feet through, and the tree is 50 feet in height. In one of the hot-houses is a splendid *Cocos coronatus*, with five ranked, pinnate leaves. There is also a unique specimen of *Pandanus sylvestris*, and a noble plant of *P. odoratissimus*. *Cycas revoluta*, with a branched head, has a clear stem of 5 feet high. *Clusia rosea* has a stem 10 to 15 feet, and *C. flava*, with larger leaves, is nearly as tall. Here are also noble *Plumierias*, with stems 10 to 20 feet in height. A specimen of *Theobroma Cacao*, 12 feet high, flowers and fruits in the garden. There is a very fine plant of *Phoenix canariensis*, 20 feet high; and a plant of the rare *P. humilis* has a clear stem of 6 feet, and very handsome plumose head. Outside, there is a fine tree of *Tilia argentea*, the Silver-leaved Lime tree, which seems the best suited of all the varieties for a hot summer climate. The Japanese *Salisburia*, or *Ginkgo biloba*, fruits here freely every year; and there

is a stately old tree of the Hop Hornbeam (*Ostrya virginica*).

September 17. At Milan.—Went to the University and saw the botanical gardens. Here we saw a stately tree of Ginkgo, 90 feet in height, with a bole 3 feet in diameter, and clear for 30 feet. It is a male tree, but near it is a female tree 50 feet high, which was covered with its yellow drupes, not unlike the fruits of *Abelia Caffra*, or those of the Green Gage Plum. It is a cool and shady, sequestered old garden, hidden away behind the great tower of the observatory. *Magnolia Yulan* is 40 feet in height, so also *M. grandiflora*. A Black Walnut (*Juglans nigra*) is 50 to 60 feet in height, with a perfect trunk clear for 30 feet, and nearly 3 feet in diameter at its base. There is a very old Lebanon Cedar here, and a *Cupressus horizontalis*, 70 feet high, having a clear stem 16 inches in diameter.

September 18.—At Pallanza, Lago Maggiore.—Visited Isola Bella and Isola Madre, both islands laid out as gardens around palatial villas. Both contain a very rich and interesting garden flora, but the last-named is by far the more natural and pleasing. At Isola Bella we saw the Japanese Umbrella Pine (*Sciadopitys verticillata*), 14 feet high; a Camphor Tree, 60 feet high, with a stem 4 feet in diameter; *Olea fragrans*, 30 feet high, and scenting the air for yards with its small white flowers; and there are groves of Oleanders of all colours, and some bushes are 30 feet high, as also are Camellias. Magnolias are 60 feet high, and perfect to the ground. The Tea shrub (*Thea viridis*) is 9 feet high, and all in the open air, as if at home in India or China. On the Isola Madre the vegetation is similar, but much more naturally grouped.

September 19.—Left Domodossolo by diligence for Brieg, a long but delightful mountain drive. Saw here *Opuntia vulgaris* on dry rocks, beside the hot and dusty road. The Sea Buckthorn is abundant in river beds, covered with coral berries.

September 20.—Brieg to Martigny by rail, thence by diligence over the Tête Noire Pass to Chamounix. A very lovely drive, the mountain sides in places being coloured crimson with the foliage of *Vaccinium Myrtillus*. Saxifrages of several kinds were seen, also great tufts of the "Parsley Fern" (*Allosorus crispus*). On the mountain side *Gentiana lutea* was in places very abundant, and the short grass was studded with the stars of the dwarf Star Thistle (*Carlina acaulis*).

September 21, 22.—Left Chamounix at six o'clock in the morning for Cluses, through a fertile and well-peopled valley. The Apple trees near the village were laden with fruit, and the last of the crops only remained in the little cultivated patches. Everywhere we heard the jingle of cow-bells, and noted the Ash trees stripped of their leaves, which are here used as fodder. At Cluses we took the train for Geneva, and reached that place. We visited the Botanical Gardens, where alpine plants are well grown in a special enclosure on eight long ridge-like rockeries. Aquatic plants have a special tank in two divisions, supplied by a constant flow of pure water.

On one of the outer walls here we saw the curious and new *Spinovitis Davidii* for the first time. It is a shrubby Vine, of which but little is as yet known, except that it grows luxuriantly at Geneva, and that it is a native of Northern China.

We next went to see the "Jardin Alpin" of M. Correvon, but we did not find the owner at home. Here we saw many alpine, mostly in pots, as if for sale.

AFTER-THOUGHTS.

One of the main objects of our journey was to see the gardens of the Riviera, and, notwithstanding the fact that we saw them at their worst, we were delighted, and found much to admire. The almost tropical character of the climate permits of many of our stove plants, and most of our greenhouse plants, being grown in the open air. The Palms and Bamboos, the Agaves and Musas, and the great Reed (*Arundo Donax*) lend an exotic luxuriance to the sunburnt rocks, the sheltered terraces, or the more gentle slopes and declivities that fringe the shore of the blue sea. To see the gardens of the Mediterranean coast

at their freshest and best, one must leave our cold and murky fogs and mists behind us in December, and in less than two days we can reach this region of sunshine and of flowers. From a London frost and fog into a land of sunshine and Roses, Violets, Anemones, and Narcissus, is a great transition, and one that once made can never be forgotten. All along the shore, from Marseilles to Genoa, and beyond, may be described as the Land of the Olive and Fig, as also of the Vine. We saw this lovely district in all its fertility, rich in corn and wine and oil, but its reign of flowers, the flush of scented spring that, coming in our mid-winter, makes this district so attractive to northern minds, had long passed away. But flowery as are the winter gardens of the Riviera, even at their best there is an absent charm amid the groves and avenues of Palms, and a craving want is felt that no luxuriance of stiff Agave, or elegant Bamboo, can dispel. In the steep hill side, or rocky gardens, the soft and restful verdure of our grassy lawns is absent, if not always at least during the hottest and driest portion of the year, being sown annually and not permanent, as with us at home. As we gazed on the richness of exotic vegetation, and heard the cool rustle of the Palm leaves overhead, we could not avoid asking what had become of the native trees and shrubs—the natural vegetation of this sunny shore? Where were the Oaks, the green and leathery Pines, the wild Olives, the *Lentiscus*, Myrtle and Smilax, the Heaths and Tamarisks, once wild and luxuriant where now aloof the alien reigns? Where was that subtle fitness or keeping, only possible when native tree or shrub, is rooted in its native soil? Now and then we saw noble remains of the native flora existing, and can never forget its exquisite charm; to wit, the Poplars and Willows of the Soane Valley; the groves of Aleppo Pines in the parks at Marseilles, the gigantic forest of Stone Pines at Viareggio, the Myrtle and Smilax, the *Lentiscus* and Heath and Asparagus, which forms a delightful jungle beneath the patriarchal Olives at Cap d'Antibes. The fact is, a good deal of sameness is common to all the gardens of the Riviera, and changes are rung on the notes eternal of Palm, Bamboo and Agave or Oleander, until one is glad of a restful day among the Oaks and Pines, or even among the Sweet Chestnut groves of the mountain side. The gardens at the Villa Pallavicini (and those on the Isola Bella) are wondrously rich in giant Camphor trees, Camellias and Tea Shrubs, Bamboo and Palms, but to enjoy these, one must endure sham ruins and fictitious monuments, and the trick and jugglery of water-squirts set here and there as traps for the unwary. Even in the best of these southern gardens there is evidence of too much artifice and of imitation, and too little of natural effects. The bizarre and the complex have been employed in place of the simple, the direct methods of garden art, and the result is disappointing. Isolated specimens and groups of certain plants we saw that claimed admiration, but in most of the gardens the real pictures were seen beyond their walls, rather than within their boundaries.

Of the abundance, quality, and cheapness of fruit in South France and Italy, one could not well say too much; nor do I think it ever will be possible for us to forget the delicious Melons at Marseilles, or the luscious Figs and Muscat Grapes of Italy. Even after being accustomed for years to Covent Garden and its wealth of delicious fruits, we were not quite prepared for the regal plethora of fruit, such as is to be seen in the market at Venice, or being taken hither and thither by the boat-load along the olive-green water of its many canals. Grapes, Peaches, Figs, and Melons, by the ton; and Tomatoes, setting the little vegetable shops and stands on fire, as it were, with their brilliant colour, everywhere. Italy is delightful in the autumn when the contadini are busy with the vintage, and the vivid orange-red cobs are garnered, or hung out to dry in the sun, on the walls of cottage and farm, lending an indescribable glow of colour to the whitewashed walls. Now and then you see the great meek-eyed bullocks at work

among the festooned Vines, great creamy fellows in quaint trappings, and apparently as gentle as they are strong. The terraced Olive-grounds, with their flickering shade and eternal greyness, were delightful, and it is nice to wander amongst the Vines early in the morning, or to rest at noon beneath the shady Fig trees, and get a fruit-luncheon or a siesta, as happy, and for the time being, as careless as the lizards of green and grey and gold that start at one's footfall, and sit here and there like shadows in the sunshine on the hot rocks, or on the old grey walls.

In conclusion, I should like to say how much I was indebted on this journey to the courtesy and camaraderie of my friends Dr. Wright, of the Dublin University (T. C. D.), and Mr. F. W. Moore, A.L.S., of our beautiful Glasnevin Botanic Gardens here in Dublin. I may also say that I was enabled to undertake this most interesting tour through the generosity of the Board of Trinity College, Dublin, who made me a special grant for the purpose from their Tercentenary Funds. F. W. B.

THE GENUS CISTUS.

This is a genus of beautiful shrubs, none too hardy, but living through ordinary winters. It is a pleasure to see that the many species and varieties are being again grown as they were before the fashion of flower-gardening known as "carpet-bedding" absorbed the attention, and misdirected the energy of the gardener. Doubtless many varieties have been lost to us, but their cultivation again will induce hybridists to get new forms. The principal points in the culture of the *Cistus* is sun and a warm soil; given these, the dwarf species and varieties grow to perfection, making a great show of bloom in the summer months. They cross freely, but their rather tender character is against their indiscriminate use. In very hard winters the plants get cut up, and, not infrequently, killed. They have, however, weathered fairly well the exceptional severity of the past few winters, damp being the greatest foe. Keen easterly winds, fogs, and wet after a spell of frost, are more injurious than actual cold. The soil should not be rich. As regards propagation, this may be done by cuttings, seeds, and layering. There are a number of kinds, both of tall and dwarf growth. We noticed the dwarf kinds blooming freely in the hot narrow border skirting the museum, facing the Palm-house at Kew; and near the entrance to the gardens is the beautiful *C. laurifolius*, which is quite hardy, the leaves smooth on the upper surface, and broader than in the better-known *C. ladaniferus*, popularly known as the gum *Cistus*. *C. laurifolius* is not so well known as it should be, although introduced from Spain about 160 years ago. The type has white flowers, but those of the variety are much larger, and blotched with intense purple-crimson at the base of each segment; it is a shrub that should be in every garden, being free-flowering and effective. The variety *C. maculatus* is distinct and handsome. A balsamic fragrance is given off by the shrub in hot weather, arising from a resinous exudation of the leaves. J.

SCOTLAND.

FRUIT, AND THE CROPS.

THE drought has been terrible, but we have withstood it ever since last March. Fruit trees in the open have had a hard time, but I see the roots struggling away from home; only root-pruned trees, as we do them, are green as Leeks, whilst two or three trees, as other people generally mutilate roots, late in the season, are suffering. Those which were lifted, replanted, and mulched, are loaded with fruit. The Peaches, from which fine crops are gathered every year, are in capital foliage. All garden crops are as fine as we could desire, and a month earlier than usual. Deep tilth defies drought. M. Temple.

REPORT ON THE CONDITION OF THE FRUIT CROPS.

[FROM OUR OWN CORRESPONDENTS, JULY, 1893.]

The words "average," "over," or "under," as the case may be, indicate the amount of the crop; and "good," "very good," or "bad," indicate the quality. The counties are arranged in numbered groups, to correspond with those adopted in the Weather Reports of the Meteorological Department, and followed in our weekly Weather Tables.

* * * Fuller comments will be given in the following number. See also Leading Article on page 85.

THE CAMPHOR TRADE IN FORMOSA.

It is satisfactory to note, from a recently-issued report on the trade of Tainau, China, that the trade in camphor shows an improvement, and bids fair to become a very important factor in the commerce of South Formosa. This product of *Cinnamomum camphora* has for some years past been a fluctuating commodity, but we are told that during the past year 5441 cwt. of camphor were exported from Tainau to Hong-Kong, as compared with 2542 cwt. in the previous year. The Government monopoly for a long time rendered it impossible for foreigners to take any part in the trade. In 1889, 759 cwt. only were exported. In 1891 the export reached 2524 cwt., but owing to the heavy so-called frontier defence-tax, which was imposed at the time the Government monopoly was abolished, it did not seem likely that any expansion of the trade would take place. The high prices ruling in Hong-Kong have, however, induced foreign merchants to take an interest in the trade, and there are now several foreign firms employing Chinese agents to purchase camphor in Mid-Formosa. The result is, that the export for the year under review has risen to 5441 cwt., and the trade seems to show every prospect of increasing. The price for camphor delivered in Hong-Kong ranged from £1 16s. to £7 10s. per picul of 133½ lb., and at one time rose to £8 14s. At these rates very handsome profits were made, and merchants could afford to pay the heavy tax alluded to above. The central districts of Formosa are very thickly wooded, and there is no fear of the camphor supply becoming exhausted for many years—some hundreds, the Chinese declare; still, it is a matter of much regret that the officials take no steps to enforce planting. These districts are apparently more accessible to Chinese than those further north, for, so far, they have not suffered from savage raids, and the camphor distillers work in peace, undisturbed by their neighbours on the other side of the frontier. From the north, on the contrary, we hear, not unfrequently, of distilleries broken up, and distillers murdered.

Although the Government monopoly has been abandoned, there are not wanting signs of an attempt on the part of certain subordinate officials to create a monopoly in one of the richest of the central camphor districts. In Yun-lin, lying to the east of Changhwa, there are one or two Chinese hong engaged in the camphor business. These hong give employment altogether to six camphor distilleries, the only ones at present in the place. Foreign merchants are anxious to start a business in Yun-lin, but are prevented by the action of the so-called camphor office, the official in charge asserting that under the camphor regulations of 1869 foreign merchants or their Chinese employes are allowed to purchase camphor up country, but that no provision is made for their employing natives to distil camphor; that, in consequence, unless they can purchase camphor from the distilleries already at work, they cannot be permitted to engage in the business, as to hire labour for the distilling of camphor is contrary to the regulations since made by the Governor of the Island. The objection raised is, of course, frivolous in the extreme, but not the less likely on that account to seriously interfere with the interests of the foreign merchants engaged in the camphor trade in Tainau.

THE ALPINE GARDEN.

CAMPANULA LACTIFLORA, *Bieb.*

A few months ago a nurseryman in Switzerland announced in the *Gardeners' Chronicle* that he had a new alpine from the Caucasus named *Campanula lactiflora*, which grew 1 foot high, and was very good for rockeries. I sent a note in reply, saying that *C. lactiflora* (M. B.) had been cultivated in English gardens for at least fifteen years, and that it grew in my garden from 5 to 8 feet high, having flowers which varied in colour from dark purple to nearly white. It was answered that my plant must be something else, and could not be true *C. lactiflora*. I now send a piece of a plant which I have just measured, and which is 7 feet 6 inches high, with a large number of primary and secondary branches

full of flowers. Will you kindly add its correct name to this note? *C. Wolley Dod, Edge Hall, Malpas.* [The plant sent is *C. lactiflora*, which is very variable. Ed.]

THE WEEK'S WORK.

THE FLOWER GARDEN.

By T. H. CRASP.

HERBACEOUS BORDERS.—The Delphiniums, perennial Phloxes, and a host of other good plants, will be in flower this month, giving a good deal of work in staking and tying the plants. Any patches of annuals which may be past their best, should be cleared away. If seed-sowing is desired, it is a good plan to cut the flower-spikes directly the lower seed-pods begin to ripen, stick them in pots filled with wet sand, and place under them a large sheet of paper, to catch the seed; this is best done under glass, and it prevents seed being lost by the wind blowing it away. Viola and Pansy seed, if sown now upon a shady border, and kept moist, will soon germinate. They may then be pricked out in beds, and transplanted when large enough to the sites where they will all flower. Pansies which flowered late should now be cut back, the soil stirred between them, and a good mulching of well-decayed manure afforded. Seeds of *Digitalis*, *Aquilegia*, *Antirrhinum*, &c., should be sown at this time. *Gladiolus*, *Hollyhocks*, *Lilium auratum*, *Ilyacinthus candicans*, *Asters*, *Anemone japonica*, *Sweet Peas*, *Helium autumnale*, and many others should be afforded liquid manure in large quantity, and a mulching of rotted manure. Choice varieties of rhizomatous sections of Iris may be increased at this season by division, and there is time to get them well established before winter. In the case of large clumps of Irises in the border, it is a good plan to lift them entirely, and properly renovate the soil by digging into it rotted manure and burnt earth, and then to plant a few pieces of the rhizomes according to the size the clump is required to be. Those not wanted for the border may be planted in nursery beds for future use. The propagation of Iris by seed is slow work unless new varieties are wished for; and in such case the seed may now be sown in boxes or pans of sandy soil placed in a cold frame. The seed will germinate next spring, and with attention in regard to pricking off, &c., the seedlings will be sufficiently large to plant out next year. The plants will flower in two or three years. *Phlox subulata* is the best of the creeping species of Phlox, and it and its varieties are well adapted for rockery planting, the front row of the border, or for spring bedding. They are raised from cuttings inserted at this season in pans of sandy soil or cold frames. The cuttings must be shaded from bright sunshine until they root. These form good plants for use next spring. Cuttings of the alpine Wallflowers, such as *Cheiranthus mutabilis*, *Helveticus Marshalli*, &c., will also root under the same treatment. Carnation seed, if sown at once in pans or boxes, will also produce flowering plants next year. Seed may be saved of good varieties. Beds or clumps of *Narcissus*, *Colchicums*, &c., that have been in the soil for two years, should be lifted, dried, and stored away for planting again in the autumn. No time should be lost in planting out the various species of autumn Crocus.

PLANTS UNDER GLASS.

By B. WADDS, *Gardener, Birdsall Manor, York.*

STOVE FLOWERING-PLANTS.—Considerable attention will be required at the present season to eradicate and keep in check the insect-pests which prey on the inmates of the stove, which this season in particular are very abundant. There are not many gardens or nurseries in the country where considerable numbers of stove-plants are grown, that are not troubled with menly-bug, and I think greater vigilance should be shown everywhere in exterminating it. This can be done. In those private places where it does not exist, great care should be taken when plants are introduced from nurseries or other gardens. I have pitched many bug-infested plants into the furnace at the risk of severe censure by my employers, rather than run the risk of having the houses overrun, but at the present time so many effective remedies can be obtained, that there is no need to be troubled with it at all. Where a stove is badly infested, apply either Chelsea Blight, Lemon-oil, Petroleum Emulsion, or Fowler's Insecticide, and follow up the dressings till the houses and plants are thoroughly clean, syringing weekly for two months afterwards, whether a menly-bug is seen or not; and

not only the plants, but every bit of the woodwork and walls twice over, each time backwards and forwards, turning the plants round after the first syringing where possible. For strength of insecticide to use, follow the directions. It is not one or two applications that will prove effective, but continued syringings; and the cost may be considerable, but it will be paid for in the end. Let the insecticide dry on the plants before the daily washings of clean water are afforded. When stocking new houses with plants, or when houses have been thoroughly cleared of the pest, a house should be set apart in which to place new plants till it is certain that they are clean. Thrips, red-spider, aphid, and scale are easily kept out, compared with menly-bug.

CLERODENDRON BALFOURIANUM AND C. THOMPSONI, that were started early, should have the old flowers removed as soon as possible, the shoots thinned where crowded, affording good waterings, and keeping the foliage clean till the wood is ripe; then less water will be needed, and a cooler house.

FOLIAGE PLANTS FOR DINNER-TABLE DECORATION.—A suitable selection of these plants for cultivating in small pots for the coming winter should be made, as many of each sort according to the needs of the family and size of the table. The plants will require to be kept in as small pots as possible consistent with their good development, and the habit should be light, and of pleasing outline, not so dense as to obstruct the view across the table. The height of the plants may range from 6 to 18 inches. During growth they should be placed where they will not be crowded with other plants, and will get light and air, so that they may grow into nice form. Generally speaking, liquid or other manure will have to be afforded, and perfect cleanliness must prevail; being grown in small pots, care must be taken that they do not get dry at the roots. A useful size of pot is the large 60 and small 48. Palms and Crotonas may be used as pairs in 6-inch pots, when vases have to be filled, but usually this size is too large for the dinner-table, and difficult to cover with foliage. Some of the most useful plants are *Cocos Weddelliana*, *Cyperus alternifolius*, *C. a. variegatus*, *Pandanus Veitchii*, *Aralia Veitchii*, *A. gracillima*, *Curculigo recurvata*, *Rivina humilis*, also small-flowering plants of *Primula sinensis* and *P. obconica*, small seedling plants of the common *Asparagus*, *Adiantum cuneatum*, *A. gracillimum*, *Pteris tricolor*. The above do very well in 3-inch pots. Of others there are *Croton majesticus*, *C. Wissmanni*, *C. Heathii elegans*, *C. angustifolia*, *Cordylina indivisa*, *Kentia Balmoreana*, *Euterpe edulis*, *Dracena gracilis*, *D. elegantissima*, *D. albo-marginata*, *D. terminalis*, *D. rubra* do well in the larger sized pot. *Selaginella*, *Panicum variegatum*, *Tradescantias*, *Pittonias*, and *Caladium argyrites*, also small plants of scented *Geraniums* are nice things when grown in small pots, and for a change pairs of small *Araucaria excelsa* are effective in 4-inch pots.

FRUITS UNDER GLASS.

By M. TEMPLE, *Gardener, Carron House, Falkirk, N.B.*

THE PINERY.—It is a practice with some gardeners to have certain dates for potting and arranging Pine-houses, but it is a better system to attend to the requirements of the plants as soon as they indicate that more room in the pots or for the leaves is necessary. Crowding is often practised when there is not space to hold all the plants when fruiting, and the suckers, in such cases, are rendered weakly; but it would be better to throw away some of the stock of plants rather than crowd them together, especially whilst actively growing. Where the pots are of various sizes, some will become full of roots, while others are not half filled; the watering in such cases requires great attention, or some plants may become sodden, while others suffer from lack of moisture; moreover, soils vary much, and a heavy close loam will need less water than a sandy loam, or the kind of peat which some cultivators make use of. Loosely-potted plants are also more likely to suffer from excess than those that are firmly potted. Pines bloom prematurely by allowing the roots to become pot-bound, or the soil too dry at this season; and they show fruit during the autumn, when only large well developed plants can produce finely-swelled Pine-apples; extreme dryness causing the Pine to fruit, but at expense of size and general excellence.

VINES.—The cracking of soil in outside borders should be prevented by the use of the prong or digging-fork, mulching it afterwards. The shanking of the berries is often caused by mere surface-watering whilst the soil at a lower depth is dry. The roots are by this state of things forced to descend into perhaps inert cold subsoil; and with abundant

surface-dressings of suitable artificial manure the roots low down may be starving, because the waterings have not been copious enough to reach them, certainly a dry state of the lower parts of a border will set up shanking. All bunches should be carefully examined, and if there should be any stoneless or shanked berries, these should be removed. Over-cropped Vines suffering by reason of cessation of nutriment from the roots, are liable to become limp and sometimes rusty before they are quite ripe. Allow laterals to grow, and keep the temperature steady while the fruits are colouring. It is better to have a moderate crop of fine fruit than a heavy crop of poor quality.

PEACHES.—The stopping of gross wood is very necessary, but the relieving of the trees from wood which has fruited, can only be of service where growth is weak, and to aid the fruiting of the shoot-wood for next season. Crowding should never be allowed to exist, but the removal of gross growth indiscriminately, and all at one time, may induce the wood which is left to form prematurely prominent buds; and then when forcing is progressing, bud-dropping may be a source of trouble.

STRAWBERRIES.—It is often necessary for want of more suitable space, to place newly-potted Strawberries on walks and other places where worms abound, but it would save much trouble if such spaces were drenched with clear lime-water before the plants are placed upon them. There are worm-destroyers which serve the purpose of ridding the gravel of these pests effectually. When the roots have grown freely, the water supply must be increased, under watering causes splitting of crowns.

MELONS.—It is a mistake to allow Melon plants to become pot-bound before planting them in their fruiting quarters. Though firm soil is conducive to free fruiting, the roots cannot remain cramped in firm soil with safety.

THE HARDY FRUIT GARDEN.

By T. TURTON, Gardener, Maiden Erlegh, Reading.

PEACHES AND NECTARINES.—The rains generally experienced have brought cooler weather, the prevailing conditions being favourable for vegetation. New growth on Peaches and Nectarines should be tied in, first dipping the points of the shoots in tobacco-water, if the black aphid is present. The operator must be careful not to let any of the liquid drop on to the fruits. Expose the fruits of mid-season and late varieties to the sun by removing leaves, or placing them behind the fruits. In some cases it may be necessary to push out the fruits from the wall, which can be easily done by placing bits of plasterer's laths behind them. The syringing of the trees must cease directly the first fruits show signs of ripening.

APRICOTS.—If wasps are troublesome, fruits may be gathered before they are quite ripe, and placed in shallow nicely-papered boxes, in ainery where the Grapes are ripe, and from which wasps are excluded. Here, in two or three days the fruits will ripen perfectly, and be fit for preserving or dessert.

APPLES.—Where the fruits were thinned some weeks ago, it will in some cases be found that some trees are yet carrying a too heavy crop, and these should again have fruits thinned off. Where there are many trees thinning, the thinnings cannot be used in the kitchen, and rather than allow the trees to be too severely cropped, till the fruits may be required for use it will be best to give them away. Where fruits are required for exhibiting of Peasgood's Nonsuch, Duchess of Oldenburgh, &c., which carry such a beautiful bloom, and which are much impaired in appearance if they get rubbed, should have all the leaves that may cause such injury removed, cutting them off with a pair of scissors.

STRAWBERRIES.—All layering should be finished very shortly, especially if a full crop of fruit be looked for next year. Runners may also be cut from the mother plants, planted out on a shady border in rows at 1 foot apart and 9 inches in the row. Here they will make good plants for forming plantations next spring, and these plants, if they are not allowed to bear fruit next year, will produce fine crops the following year. All plantations from which runners are not required must have the same trimmed off, and the litter and weeds cleared up. In the case of young beds of Vicomtesse Héricart du Thury which may promise an autumn crop, unless the ground is foul with weeds, the strawy litter may be allowed to remain, thus saving the same amount of labour.

GRAFTED TREES.—The stem-growths on late-grafted trees should be cut off, as well as the ties round scions that are increasing in size, securing the latter to sticks. If American blight be observed when the grafting clay is removed, at once use the petroleum and Gishurst Compound insecticide as advised in a former Calendar.

THE KITCHEN GARDEN.

By H. C. PRINSEP, Gardener, Buxted Park, Uckfield.

WINTER SPINACH.—The surface-soil being now moist, is in good condition to receive the seed for the main crop of Spinach. It is a mistake to suppose that this plant withstands frost the best if the plants are small at that season, and my experience is that the opposite holds good, strong well-grown plants being better than small weak plants. The drills should be at least 1 foot apart, and if the ground be in very good heart, 1½ foot will be found a better distance, the foliage having then space for full development. As soon as the seedlings have grown to a size large enough to be handled conveniently, they should be thinned to at least 3 inches apart, and when the leaves touch there should be a further thinning. If the plants that are drawn at these thinnings are not required for filling-up purposes, they may be used in the kitchen. When finally thinned, the plants should be left at 1 foot apart. Spinach does best on land which is rich at the surface, the plants growing then freely, whilst of small size. It is not prudent to dig into the land a quantity of fresh manure, as it induces rank growth at a late part of the autumn when the roots have reached it; and such foliage is often cut down by the early frosts, and the plants rendered almost useless.

AUTUMN ONIONS.—Though it is yet a little too early for the sowing of Onions to stand the winter, it is well to take advantage of the moist condition of the soil, as the seed will germinate now more freely than if the land became dry. If the plants should get too forward they may be transplanted early in the month of September, which will check growth and leave time for the roots to take fresh hold. For early use, the Queen is a good variety to sow, fair bulbs being obtainable usually early in April; and by the middle of May, they are fully grown. Since this variety was introduced, a more trustworthy crop of spring Onions can be obtained than formerly, the plants seldom running to seed.

TURNIPS.—When Potatoes are dug up, the ground may be levelled and sown with Chirk Castle, Black Stone, Veitch's Red Stone, Golden Ball, &c. If the seed be sown to produce greens in the spring months, it is not necessary to thin the plants so much as when roots are the main thing, still ample space should be left in each case, so as to ensure strong plants.

GREEN CROPS.—Savoys for late use, Broccoli Kale, and late Sprouts, may still be planted.

SALADS.—These will now grow more freely than during the drought. Mustard and Cress, which is apt to damp off in very wet weather, should be protected from rain. Radish seed should be sown at intervals of a fortnight, Endive and Lettuce transplanted as occasion serves.

HERBS.—Make a sowing of Chervil on a warm border. Put in cuttings of Lemon Thyme in a cold frame, as it is a plant that gets destroyed by severe frost. Sage shoots should be layered, choosing strong ones for the purpose. Savory, and the supply of Basil, herbs in frequent request, should be kept up. Young Celery for flavourings, and any other herbs required in a young state, should be sown, to keep up the supply.

THE ORCHID HOUSES.

By W. HOLMES, Gardener, Pavilion Lodge, Tunbridge.

MASDEVALLIAS.—Those of the Chimara section of Masdevallia should now be examined as to the state of the materials, drainage, &c. All of ours are grown in baskets, which are hung up in the house where the Miltonia vexillaria are grown. At this overhauling, the plants should be dipped in a weak solution of Fir-tree oil, which will kill the red-spider, which sometimes infests them, and causes the undersides of the leaves to become of a brown colour. The compost that best suits these plants is one consisting of peat and sphagnum moss, rather more of the latter than of peat, the flower-spikes more easily finding an exit through it to the bottom and sides of the basket.

Miltonia vexillaria rubella and M. v. superba are

varieties worthy of being included in the choicest collections, and they come into flower one month later than the large-flowered forms. Miltonia v. superba is a very distinct and pleasing form, and I find that M. v. rubella is a better grower than those M. vexillaria with larger flowers.

CATTLEYAS.—Cattleya Dowiana, C. D. aurea, and the supposed natural hybrids between C. aurea and C. Sanderiana, are finishing up their pseudobulbs and flower-sheaths, and should not lack water at the root. The bright weather we have hitherto had has just suited these species, the spikes and the plants will flower next month and September, which is the period when a number of these so-called hybrids flower. After flowering at this season, they should be removed to a cooler and airier part of the house. C. aurea is the freer flowering of the two, besides being the most gorgeous species of Cattleya, and it does not require the great amount of heat that is often recommended for it, as there are plants of it at Pickering Lodge which are grown in various parts of the Cattleya-house which differ as much as 10°, and those plants at the cooler part are quite as strong and as forward as those placed at the hotter. These plants are cultivated in shallow Teak baskets, with a very small quantity of materials about the roots; these consist of crocks, peat, and sphagnum moss. The plants hang close up to the roof, and there is no difference in their health or flowering whether hung on the north or south side of the house. Cattleya Rex will turn out to be a grand addition to Cattleyas when fully established.

THE APIARY.

By EXPERT.

WASPS.—These are almost as great a nuisance to the bee-keeper as to the fruit grower, and the warm dry weather has suited them so well that they have in some places increased and multiplied to an alarming extent, and commenced their depredations earlier in the year than usual. They not only find their way into the hives, bent on stealing the honey, but they attack and kill the bees as well, and carry their bodies off piecemeal to their nests. Strong stocks are able to defend themselves better than the weak ones, and it is a great help to them to narrow the entrances to the hives, so that only one or two wasps can pass at a time. Chilly nights and mornings seem to place the bees at the greatest disadvantage, as wasps are active and able to fly at a lower temperature than bees, and at such times they seem to have it all their own way. One of the best ways of catching the wasps is to place small-necked bottles about the hives containing a little beer, sweetened with treacle or sugar, into which they will find their way and get drowned. The bees will be quite safe, as they will not touch this mixture. The wasp nests, too, should be sought out and destroyed, and if they are in the open, one of the easiest and most expeditious ways of doing it is to pour in some tar. Should the nest be in a bank or other place where tar cannot be applied, they will rarely be able to get out if the entrance is blocked up with wadding soaked in turpentine.

CONDEMNED BEES.—Where bees are wanted they can be obtained in most country districts to almost any extent for the asking, or at the rate of 6d. per skep from cottagers who are in the habit of sulphuring their bees. Arrangements should be made to drive them as early as possible, so that they may have plenty of time to get established as fresh colonies. It is generally necessary in order to make a good colony to put the bees from two or three straw skeps together into one frame hive; and they do much better if built-out combs can be provided, as the labour and exhaustion of building comb is saved them. These bees are very useful for strengthening weak stocks, but great care must be taken in uniting, or fighting is sure to take place. The safest way is to get the new-comers established in a hive stood at the side of the colony to which they are to be joined, and then unite in the ordinary way, by transferring the frames after both lots have been dusted with flour.

CLOSE OF THE SEASON.—The season of honey gathering has almost finished, and the sooner extracting is completed the better, as the honey will leave the combs better now than later on, when it gets thick. Filled sections should be taken away, and those not finished put back in the hive, in the centre of the crate if it is thought there is any chance of getting them completed. If not, they too should be passed through the extractor, and then returned to the bees to be cleared out.

EDITORIAL NOTICES.

LETTERS FOR PUBLICATION.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for contributions, or to return unused communications, or illustrations, unless by special arrangement.

PLANTS, &c., TO BE NAMED.—Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be carefully packed and numbered, and not more than six should be sent at one time.

LOCAL NEWS.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

ILLUSTRATIONS.—Photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c., are particularly solicited; but the Editor cannot be responsible for loss or injury.

NEWSPAPERS.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Advertisements should be sent to the PUBLISHER.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETINGS.

TUESDAY, JULY 25. Royal Horticultural Society: Committees, at the Drill Hall, James Street, Westminster.

WEDNESDAY, JULY 26. Royal Botanic Society: Musical Promenade.

SHOWS.

TUESDAY, JULY 25.—Tibshelf Rose.

WEDNESDAY, JULY 26. Gardening and Forestry Exhibition: Carnations and Proteas. Beckenham Horticultural.

THURSDAY, JULY 27. Halifax Rose. Southwell Rose.

SATURDAY, JULY 29.—Bedale Rose.

SALE.

FRIDAY, JULY 28. Orchids, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—63°.4.

FEW perennials have a nobler effect on a lawn, or anywhere where there is sufficient space, than *Polygonum sachalinense*. One drawback it has, and that is, that it throws up its great *Asparagus*-like shoots in profusion, and not always where they are wanted. A gravel path, as we know, offers no obstacle to this very "pushing" intruder. In the following letter, M. BALTET calls our attention to the value of the plant for forage purposes. *P. cuspidatum*, which has a similar habit, but which is of smaller dimensions, might, in its degree, answer equally well, but we have no personal knowledge whether or not the leaves, fresh or dry, would be acceptable to stock:—

"The severe drought we have passed through this year, will, we think, enable horticulture to come to the aid of agriculture as it did with regard to Vine-growing twenty-five years ago, in introducing the practice of grafting vines on the American stocks. *Polygonum sachalinense*, the subject now under consideration, is a perennial plant, hardy and vigorous, bearing with equal indifference extremes of heat in summer, and cold in winter.

"We have cultivated this plant since its introduction into France, for purely decorative purposes. The young white shoots are eatable, but they do not rival *Asparaguses*, while its splendid foliage may be made use of for garnishing dessert and for packing fruit.

"Moreover, the trials of M. DOUMET-ADAN-

SON on the forage uses of our *Polygonum* transmitted to the Académie des Sciences by M. DUCHARTRE, and the communications we have made to the Société Nationale d'Agriculture of France have brought the plant into notice, and called the attention of cultivators to it.

"The *Pericaria*, or *Sakhalin Polygonum*, was discovered by the Russian explorer, Maximowicz, in the Isle of Sakhalin, situated in the Sea of Okhotsk, between Japan and Siberia, a moderately large island, ceded to Russia by Japan in exchange for the Kourile Archipelago.

"In 1869, our friend EDOUARD ANDRÉ noticed this new introduction in the Jardin d'Acclimatation of Moscow, where it was exceedingly decorative, and brought it into France, telling us of its vigorous growth both above and below ground.

"The roots in fact branch on all sides, and pass horizontally from the rhizome, penetrating the hardest soils, and giving origin to new shoots which further increase the size of the clump.

"The stems are numerous and closely set; they vegetate early, and are not long in attaining a height of nearly 10 feet, although the first frosts may attack the tips. Small, long, zig-zag ramifications develop in the middle and at the top of the plant.

"The foliage is most effective, the leaves being alternate, distichous, oval-oblong, measuring 12 to 15 inches long, by 9½ broad, and smooth with no trace of hairs. The petiole is carmine, the stem when developing shows a reddish tinge on a green background. The dull white flowers appear in small axillary bunches, growing together in long paniculate fascicles and clusters which bend slightly under their own weight. The bees visit freely the plant in autumn, but it is remarked that the bloom does not appear on a plant regularly cut for forage purposes.

"The experiments made at Baleine are sufficiently conclusive as regards the question of fodder. A young plant put into the ground is not slow in covering a surface 3 feet square with its leafy branches. The first cutting is made when the stems are from 3 to 4½ feet in height; if the second growth is strong enough, a second harvest is gathered, but on the following years three or four annual cuttings can be made.

"The total produce of the green yield may rise from about 44 to 88 lb. per square yard (20 to 40 kilogrammes per metre), it can therefore be reckoned at about from 95 to 190 tons per acre. According to the observations of the President, M. DOUMET, cattle are extremely fond of it. M. EDOUARD ANDRÉ has tried it under these conditions, also M. GUSTAVE HUOT, Président du Comice Agricole de l'Aube, and so have other growers with equal success. The *Sakharin Polygonum* not yielding seed, we multiplied it by the rhizomes, and quickly raised thousands of available plants which we were able to give to the Ecoles d'Agriculture, and in answer to daily demands for it.

"The best plantations are made in August and September, or in spring; an ordinary soil suffices, nevertheless, a little moisture serves to increase the strength and facilitate a second green crop.

"The cultural difficulties are not worth mention, and during winter no protection is needed. The dormant stems should be cut down in spring before the new buds develop. In spacing the plants, 3 feet of ground will not fail to be covered by their abundant and nutritive vegetation. CHARLES BALTET, Troyes."

DENDROBIUM FIMBRIATUM.—This is a Nepalese species, introduced so long ago as 1822, but one which holds its ground as "the finest of the orange-yellow *Dendrobes*," and "remarkably floriferous." *Vitch Manual* (*Dendrobium*), p. 43. The illustration we give, fig. 20, bears out this statement. It represents the variety *oculatum*, which differs from the type in the possession of a large purplish-brown spot on the lip. Mr. GRANT, gr. to Viscount GALWAY, Serlby Hall, Bawtry, who favoured us with the photograph, says the plant figured bore 500 blooms, and made twelve growths last year. The lip is elegantly fringed at the margin.

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the Society will take place on Tuesday, July 25, at the Drill Hall, James Street, Victoria Street, Westminster, the Fruit, Floral, and Orchid Committees assembling, as usual, at 12 o'clock. At 3 o'clock, a paper on "Alpine Houses and Plants," will be read by Mr. H. SELFE LEONARD.

— This Society intends to hold, from August 22 to September 1, 1893, at the Royal Agricultural Hall, Islington, what is expected to be one of the greatest shows of fruit, flowers, and vegetables that has been held in this country. The amount of money offered in prizes exceeds £400. It is felt that the time has come when large numbers of nurserymen, professional and amateur gardeners, should be brought together once a year to study the advances made in horticulture, the latest inventions, and the most approved methods, in the same manner as is annually done by agriculturists at the Royal Agricultural and Smithfield Club shows. When the vast number of persons who are interested in horticulture and arboriculture is considered, this show should be made second to no other held in London during the year; and it should prove as profitable to the exhibitors as the annual cattle show held in the same building, and on the lines of which it is intended to carry out the exhibition. Cultivators are taking a lively interest in this new scheme, and it is thought that the central area of the great hall (the whole of which is allotted for competitive products) will not be any too large for the numerous exhibits. Special awards will be offered for heating apparatus, greenhouses, appliances, &c., and for these exhibits space is being largely appropriated. This part of the show is under the direction of the officials of the Royal Agricultural Hall Company, and it is anticipated that all the manufacturing firms of repute will make a good display on this occasion, and practically demonstrate to buyers the value of their productions. Those who may be desirous of securing space should make written application for the same without delay. We earnestly trust that something will on this occasion be done to break away from routine, to ensure artistic effect, and, above all, by careful arrangement and instructive labelling to enhance the educational value of the show.

NATIONAL CHRYSANTHEMUM SOCIETY.—The annual outing of the members and friends of the Society took place as announced in the grounds of Wycombe Abbey, High Wycombe, on the 17th inst., and brought together a large company, including visitors from Oxford, Aylesbury, Maidenhead, Slough, &c. The grounds and gardens, after the recent invigorating rains, were seen at their best, and Mr. G. T. Miles was foremost in making arrangements for the comfort and convenience of the company. One important part of the day's proceedings was a cricket match between members of the Aylesbury Floral and Horticultural and National Chrysanthemum Societies, in which the former proved successful by eight wickets. Many availed themselves of the opportunity to look through the Abbey, and to walk about the gardens and grounds. Early in the afternoon nearly 150 persons partook of dinner in the spacious new hall adjoining the Abbey, under the chairmanship of Mr. ROBERT BALLANTINE; the health of Lord CARRINGTON being drunk with enthusiasm. In the afternoon, visits were made to the chair-making factory of Mr. WILLIAM BIRCH; and also to the grave of the late Earl of BEACONSFIELD at Hughenden Church. A very large party assembled in the Hall to tea, and the great bulk of the visitors left by the 8 o'clock train for London. An extensive collection of seedling Carnations, now in bloom in the Abbey gardens, raised from seed sent by Mr. MARTIN R. SMITH, was an object of great interest.

ROYAL HORTICULTURAL SOCIETY OF ABERDEEN.—The arrangements for this Society's annual floral fête, which is to take place in the Central Park, Aberdeen, on August 17, 18, and 19, are well advanced. The schedule contains the following

intimation, which gave so much satisfaction last year:—"In the event of the fête being a financial success, 50 per cent. will be added to the prize-money offered in this schedule." The gala promises to be a very successful one. Competitors are reminded that entries close on August 14, at 12 noon.

CALATHEA ALLOUYA.—During the year 1890 (as stated by Mr. HART in the *Report of the Trinidad Botanic Garden*), attention was called to the sale of a curious tuber in the local markets, which was named "Topitamboo" or "Topinambour." The source of this tuber, and the scientific name of the plants producing it, were then unknown. They have now been authentically determined as the produce of a Scitamineous plant known as *Calathea Allouya*, Lindl. The smaller tubers, boiled, and eaten with salt, form a very agreeable and palatable food, and will possibly prove a welcome addition to the table in many

These will eventually prove very valuable records. Among novelties, mention is made of *Gongora Charlesworthii*, Rolfe, staged at the Temple Show; of *Cattleya intermedia* var. *picturata*, *Braassia Lewisii*, Rolfe, exhibited at the Temple Show; *Ansellia nilotica* var. *Rossiana*, *Odontoglossum baphicanthum* × var. *immaculatum*, *Lælia purpurata* var. *discolor*, *Odontoglossum Kramerii album*, *Neodryas Sacciana*, *Oncidium zonatum*, and *Cymbidium grandiflorum* var. *punctatum*.

PATENTS.—British patents are taken out at the risk of the applicants, who are expected to cause a search to be made as to the novelty of their inventions. To facilitate such inquiries, the Comptroller-General of Patents, Designs, and Trade-marks, has caused to be compiled an abridged list of all specifications between 1877 and 1883. From 1884 onwards, similar provision is made, so that the intending patentee may satisfy himself that he is not infringing

catcher. Although there is only one invention relating to fly-papers, there is a considerable number of compositions and apparatus for destroying phylloxera, caterpillars, alogs, wire-worms, lodging-house pests, beetles, field-mice, moths, Potato-bugs, &c. It is curious, also, that although silos were in use five centuries before the Christian era (according to Prof. THOMAS ROGERS), and were experimented with in America in 1876, and in France as early as 1852, the first English applications for patents appear to have been made as late as 1883. Gardening appliances are included under the head of "Agricultural Appliances." The latter list, comprising pp. xviii. and 246, with illustrations, may be had for 9d. All the publications referred to may be seen at the Science and Art Department, South Kensington, the Guildhall Free Library, and other like institutions.

THE FERMENTATION OF MANURE.—When stable manure is allowed to ferment, much of its "goodness" is lost; and it is the practice with some people to add gypsum, iron sulphate, and other chemicals, in order to prevent or retard this decomposition, the idea being that such substances will absorb the free ammonia, and then prevent it from being lost. The practice, however, is quite useless, for it has recently been shown by M. A. HÉBER that it is only necessary to keep the manure sufficiently moist in order to prevent the loss of nitrogen through the ammonia being given off. The fermentation of manure is at once an advantage and a disadvantage; the latter may be obviated entirely by moistening the heap occasionally when the manure gets dry, the so-called "methane" fermentation is retarded, and the ammonia evaporates; the addition of water promotes this fermentation, and reduces the risk of loss of ammonia. (*Vide Comptes Rendus*, vol. cxv., pp. 1321 to 1323 for further details.)

MR. BARRON.—We observe in the *Bulletin d'Arboriculture*, that a portrait of this well-known horticulturist, reproduced in its pages, is said by an oversight, to have been taken from the *Gardeners' Chronicle*. The portrait in question was taken from the *Garden*, as indeed obvious from the woodcut itself.

LIQUORICE AND ORANGE CULTURE IN ALEPPO.—The cultivation of Liquorice seems to be attracting a good deal of attention in new countries, and developing in others. In Aleppo, for instance, it is stated to have very largely developed, and is considered to be of sufficient importance to merit special attention. It is now collected on a large scale throughout the province, and in some degree compensates for the losses caused by bad harvests; 6145 tons, valued at £43,231, were exported to the United States last year, as compared with 4293 tons, of the value of £28,077, in 1891. The export of Oranges also from Aleppo, which has hitherto been insignificant, is stated to be yearly increasing, new plantations having been made on the seaboard, and the sales in the English markets giving very satisfactory results.

REV. H. H. D'OMBRAIN.—The many friends of this gentleman will hear with sympathy of the great sorrow that has befallen him and Mrs. D'OMBRAIN in the loss of their elder daughter.

A NEW GREEN PIGMENT IN PLANTS.—The first green pigment not identical with chlorophyll, has recently been isolated from the succulent part of the fruit of *Trichosanthes pubera* by Herr TSCHEBACH. His method was to extract the fruit with ether, and then dissolve out the pigment from the residue by means of alcohol. It is a dark powder, and has been named *Trichosanthin* (*vide Chem. Centr.*, 1892, ii., p. 80).

TRINIDAD.—At this island, at 130 feet above the sea-level, the mean annual temperature for 1892, according to Mr. HART, was 78°·7; the maximum, 88°·7; the minimum, 67°; the range being very slight. Ninety-one inches of rain fell in the year, mostly in June, July, and October.

FIG. 20.—DENDROBIUM FIMBRIATUM OCLATUM. (SEE P. 96.)

tropical countries. With regular and improved culture, it is probable that the tubers could be much increased in size, and possibly in flavour. It is certainly a vegetable which should find a home in every tropical garden, and also well worthy of being tested for use in sub-tropical countries.

GARDENING AND FORESTRY EXHIBITION AT EARL'S COURT.—At the suggestion of the Directors, a committee of ladies organised a Rose Sale at the Earl's Court Exhibition on Saturday evening last in aid of the Victoria Fund. A number of stalls was arranged in the centre of the building around the band of the Hon. Artillery Company, and after 8 o'clock a scene of busy excitement ensued. Although the idea was hastily developed, upwards of £40 was realised. Among those who rendered valuable assistance were the Misses MILNER, Mrs. and the Misses DODSON, and Mrs. HARRY TURNER.

"THE ORCHID REVIEW."—In the current number, the history of Orchid hybridisation in general, and that of the genus *Odontoglossum*, is continued.

existing rights. The abridgment class, "agricultural appliances, farmyard, and like (including the housing, feeding, and treatment of animals)," contains short descriptions of over 300 inventions, from 1877 to 1883 inclusive. Of this number, about one-fourth relate to food for cattle and other animals, and the remainder to such subjects as barns and sheds, chaff-cutters, cages, and pens, oilcake-crushers, rick-covers, feeding and drinking appliances for animals, litter for live-stock, peat-openers, root-cutters and pulpers, and sheep, &c., dips and insecticides. Amongst the incubators also included, some are proposed for the rearing of infants and snakes, and even for propagating bacteria, as well as for hatching chickens. Inventive genius has also devoted its attention to the comfort of the ostrich in the matter of pens and foster-mothers. Traps are described which are intended not only to catch rats and mice, but also cats and dogs, birds and cockroaches, locusts and moles, &c.; there are only two man-traps, however, one being available also for rabbits, &c., and the other an electric burglar-

MR. JOHN KNIGHT.—We are pleased to learn that this gentleman has been appointed District Superintendent of Parks and Open Spaces, North of the Thames, under the auspices of the London County Council.

WALNUT TIMBER TREE.—It is stated in *Zeitschrift*, a new horticultural magazine published in Berlin, that for planting for timber the best kind of Walnut is that known in France as *Contaras*, *Conturie*, and *Pointue*—*Juglans regia rostrata*. The fruit has a point at each end, that at the stalk end being similar in form to the other, but is easily detached, whilst the other point can only be removed by the use of much force. The tree grows vigorously in the climate of northern Germany, is not at all injured by frost, and is very prolific. The kernel is not large, but it has excellent flavour. The variety can be recommended for road-side and forest planting.

THE "BOTANICAL MAGAZINE."—The plants figured in the July number are the following:—

Acanthorhiza aculeata, t. 7302.—A very handsome Fan Palm, 27 feet high, discovered in the mountains of S. E. Mexico by MM. LINDEN and FENCK in 1840. It is remarkable for the rigid spinous adventitious roots that are thrown out from the base of the trunk. The flower-panicle now figured for the first time is pale yellow, the densely-crowded flowers dark creamy-pink. Hort., Kew.

Lasiophon anthyllodes, t. 7303.—A South African Thymelaceous shrub, with sessile linear-lanceolate revolute leaves in many ranks, and terminal heads of yellow tubular flowers. It flowered in the Cambridge Botanic Garden.

Miscanthus sinensis, t. 7304.—A handsome grass, with the habit of the Pampas-grass, but with linear leaves and looser flower-panicle. It is nearly allied to the Sugar-cane and to *Eulalia*; indeed, it is the *Eulalia japonica* of gardens. The plant figured under the latter name in the *Gardeners' Chronicle*, 1877, p. 565, fig. 89, referred to this species by HACKEL, agrees better, says Sir JOSEPH HOOKER, with *M. japonicus*.

Vaccinium padifolium, t. 7305.—A Whortleberry, native of Madeira, closely allied if not identical with *V. arctostaphylos* of Asia Minor and the Caucasus. This wide severance of habitat is paralleled by the case cited by Sir JOSEPH HOOKER of *Rhododendron ponticum*, which is found nowhere between Asia Minor and South Spain. These cases point to Spain and the Atlantic islands as the western home of the fragments of a flora that once extended over Europe and North Africa, but which is now exterminated by adverse circumstances.

Crotalaria longirostrata, t. 7306.—A handsome winter-flowering Leguminous under shrub, with long-stalked trifoliate leaves, and racemes of yellow Laburnum-like flowers. The plant flowers freely in the temperate-house at Kew from December to March; it is, therefore, a desirable winter-flowering greenhouse plant. It is a native of Mexico.

VANILLA.—The only species which Mr. HART deems worthy of cultivation in Trinidad is *V. planifolia*.

CAMPANULATE FOXGLOVE.—An Australian correspondent, Mr. HACKETT, Adelaide, has kindly sent us a photograph of a spike of a Foxglove in this condition, which is due apparently to the running together in the embryonic condition of several flowers. In this country the change is very frequent, but we are not able to say what causes co-operate to induce it—probably, the causes are complex. An Australian climate is evidently no bar to its production.

STOCK-TAKING: JUNE.—As will be seen by the accompanying table of excerpts from the Board of Trade Returns for the past month, there is a falling off in the imports, which may be taken as an exceptional condition of affairs, in the face of increased exports. This falling off amounts to £908,687. Though there is a decrease in the imports of food, there is no improvement in the condition

of agriculturists at home, and the issue of a Royal Commission to take this matter into serious consideration, will be viewed by those interested with satisfaction. It is all very well to reduce the rents here and there by ten, twenty, and even occasionally, twenty-five per cent.; but however kindly meant, this is not the best method of relieving existing distress or of helping to make things better for the future. Owners and occupiers alike are interested in the thorough sifting of the matter from beginning to end; there is nothing sentimental involved, only the question of "letting live" as well as "living." The excerpts above noted are as follows:—

IMPORTS.	1892.	1893.	Difference.
	£.	£.	£.
Total value for month	£32,777,479	£31,568,792	-908,687
§II.—(A.) Articles of food and drink — duty free	13,323,160	12,462,886	-860,274
(B.) — do., dutiable	1,421,963	1,636,895	+214,732
§VI.—Raw materials for textile manufactures (including Flax, Hemp, and Jute)... ..	4,425,523	4,519,062	+93,539
§VII.—Raw materials for sundry industries and manufactures (including wood and timber, hewn, sawn, split, dressed; vegetable materials, for paper-making, &c.)	3,721,372	3,462,845	-258,527
§IX.—Miscellaneous articles (including Clover, Grass, Flax, Rape, Linseed) ...	908,295	1,024,584	+116,289
(B.)—Parcel Post ...	35,214	53,727	+18,513

Whilst noting a decrease in some of our colonial supplies, we are reminded of the stock-taking at the dinner of the Cobden Club the other day, when attention was directed to the fact that many colonists are kicking against protective tariffs—so protective in some cases as to be nearly prohibitive—consequently industries languish in towns, and the land is not cultivated as it might be, and certainly ought to be, when there is so very much surplus labour at home, and the "cry of the poor" is no new thing in colonies which ought not to be so burdened. The diminution in the imports of Apples last month, as compared with the same period in 1892, seems to point to greater care in selection, and probably the higher prices for those imported. This note brings us to the following extracts from the general mass of figures, and they will be found to possess more than the usual interest:—

IMPORTS.	1892.	1893.	Difference.
Fruits, raw:—			
Apples bush.	71,672	39,857	-31,815
Cherries "	115,913	195,213	+80,295
Plums "	6,103	28,053	+21,950
Pears "	23	4,732	+4,709
Grapes "	3,398	5,186	+1,788
Unenumerated "	93,535	236,708	+143,173
Onions "	132,926	139,129	+6,194
Potatoes cwt.	794,081	1,100,643	+306,562
Vegetables, unenumerated, raw, ... value	£110,369	£184,241	+£73,872

It may not be inopportune to note here that, notwithstanding the competition with outsiders in the item of hops, there is no diminution in the area of land devoted to the cultivation of this plant. If there be an occasional decrease in the area where profitable growing is somewhat problematical, there is an increase where profit is assured by geographical position, and this we note as an item of interest to all concerned in the brewing interest.

THE EXPORTS
for June of goods manufactured in Great Britain and Ireland show an increase of £714,953 as compared with the month of June, 1892. This increase is pretty generally distributed, but the exports to India show the greatest value—a fact which may certainly be attributed to the "fixing" of the rupee,

and consequent steadying of the rate of exchange. The Indian Government is generally lauded for the steps they have taken, and a still further increase in our exports to our Eastern Empire may with some confidence be now anticipated.

MENTONE PRODUCTS.—Referring to the cultivation of economic plants in Mentone, the British Vice-Consul says that in consequence of the mountainous character of the country, the natural products are few, the principal one being Olives, which of late years have suffered much from disease, and also from the competition of the towns round about, where the expression of the oil is carried on in a scientific manner, whereas the old method is still employed at Mentone. A few Olive plantations are well cultivated, and appear profitable to their owners; this must be considered an exception, as the Olive culture for this part of France seems to be rapidly declining, and put aside as unprofitable, the ground being employed for building purposes or for Lemon and flower culture. A special mention must be made of the growing of Lemons, which has regained its former celebrity. During the summer months Lemons of the first quality fetch as much as £2 5s. per 1,000. The total crop may be estimated at 200 tons per annum. Lemons from this part are superior in quality to those of Sicily, although not so large. The exceptional climate of Mentone renders flower growing comparatively easy, and with a scientific knowledge of gardening, and a little capital, good results can be obtained during the winter. Flowers and vegetables reared under bell-glasses thrive well, and vegetables, such as Potatoes, Asparagus, and Green Peas are successfully reared in the open air. These articles when sent to the London and Paris markets fetch very high prices.

HYBRID WATER LILIES.—We learn that several of M. MAULIAC's hybrids and seedlings have been very beautiful in the Trinity College Botanic Garden, Dublin, since May. The colours range from white to rose-crimson or yellow. *N. Marliacea chromatella* (sulphur), *N. exquisita*, *N. odorata rosea*, *N. Leydeckeri rosea*, *N. pygmaea Helvola* are perhaps the best, but all are beautiful. Their hardiness is shown by the circumstances that they have passed the last two winters in a cold-water pond.

M. A. DE LA DEVANSAYE.—We are pleased to have the opportunity of congratulating our French horticultural colleagues on the recognition paid to horticulture in France by the appointment of M. DE LA DEVANSAYE as a Chevalier of the Legion of Honour. M. DE LA DEVANSAYE has been President of the Horticultural Society of Angers for twenty years, and is well known not only as a connoisseur, but for his direct contributions to the progress of horticulture.

THE ACTIVE PRINCIPLE OF ANEMONE SYLVESTRIS.—Dupuy finds this to be a well-defined solid, which crystallises in needles. He says (*Nouv. Rem.*), "From a therapeutic point of view, anemonin is an agent of great value, acting efficaciously in acute and chronic bronchial catarrh, and as a calmative of the spasmodic and irritative cough of whooping-cough. It is also of value in eye troubles, dependent upon the rheumatic diathesis, and possesses powerful emmenagogue properties!" Who would have thought it of the simple little Anemone!

SOME CHEMICAL PRINCIPLES OF THE PINE FAMILY.—A great deal of attention is at the present moment being given by chemists to a class of substance mostly occurring in the vegetable world and called terpenes, on account of their close relation to turpentine. The most important of these is called pinene, which occurs in most of the Pines; then there is camphene, which is closely connected with the product of the camphor tree. Limonene is found in the fruit of the Lemon-bergamot, Cummin, Dill, Fir-needles, and in *Erigon canadense*. Dipentene is very similar to Limonene; it occurs in the camphor tree and in the Elemi. Sylvestrene is found in some of the Russian and Swedish Pine trees; phellandrene in the Bitter Fennel, the Water Fennel, Elemi,

and Eucalyptus. Terpinene occurs in the Cardamon, and there are two or three others that are only slightly known.

THE PRODUCTION OF ORRIS-ROOT, ATTA OF ROSE, AND VANILLA.—*The Chemist and Druggist* states that the cultivation of Orris (*Iris florentina*), which was introduced into southern France a few years ago by a Grasse perfumer, is assuming larger dimensions, and it is considered that there is every prospect that it will be a permanent addition to the list of products cultivated in the maritime Alps. At present, the Orris grown around Grasse, is all consumed locally in the preparation of oil of Orris-root. We also gather from the same journal the following interesting notes on the Rose crops at Kezanlik and the Vanilla crops at Mahé (Seychelles). Regarding the former, the following letter is given from a Bulgarian correspondent:—"I have just returned to Kezanlik from a tour through the Rose district, and

auctions during the week ending May 13 was very small, there have nevertheless been considerable imports lately, and indications favour a further decline in the article at an early date.

ROSE BUDDING.

THE season for budding Roses having arrived, we insert, for the benefit of amateurs and others who may not be well acquainted with the operations, several figures, which will make it perfectly clear to them. We need merely add to the information found under each figure, that in separating the bud from the shoot of which it forms part, the inner part, or core of the bud, must not be drawn out, and there is less risk of this being done if it be stripped off from top to bottom; and there must be no bruising of the bud, or loss of time in inserting it on to the shoot of the Briar, &c.

Fig. 21.—Making Slit in Bark of Stock.

Fig. 22.—Slicing off a Rose Bud.

Fig. 23.—Separating Shield from the Wood.

Fig. 24.—The Bud Inserted, but not cut off at top.

Fig. 25.—The Bud Tied-in.

Fig. 26.—Loosening the Tie, after the Bud has begun to grow.

ROSE-BUDDING DIAGRAMS.

can assert that there is no truth in the rumour that the gardens have been damaged by the severe cold weather. The fact is, that in spite of the harsh winter, the heavy fall of snow has acted as a protection from the frost which followed. There are some few gardens damaged, especially those exposed towards the north, but they are few and far between, and practically all the gardens are in very good condition. The real danger to the Rose crop is the white-frost, which usually comes on in April during the budding season. This danger has been successfully passed this year, there having been but little frost. The next danger to which the crop will be exposed will be excessively dry or hot weather in the gathering season. Should this also be averted, the harvest will be more than an average one. There is every probability that this will be so, as the season is very backward, and danger of frosts is almost passed now. On the subject of Vanilla, it is reported under date of May 6, from Mahé, that the crop was estimated to yield from 35,000 to 40,000 lb. Although the quantity declared for sale at the London drug

The bast, which should be new and soft, is best when used in a wetted state, and it must be drawn firmly, but not tightly, and fastened by slipping the loose end through the last coil.

Some persons prefer worsted as a binding material, and there is this to be said for it—it is elastic and soft. The idea is to close the slit made in the stock, and press home the bud, that no rain may enter—the air cannot be excluded.

PLANT PORTRAITS.

ANGREĆUM ARTICULATUM, *Lindenia*, t. 380. A very beautiful species, introduced originally from Madagascar by Rev. W. Ellis.

BISMARCKIA NOBILIS PALMACEÆ, *Garden and Forest*, June 7.

BRASSIA BICOLOR, Rolfe, in *Lindenia*, t. 378. Flowers nearly 5 inches in greatest length, sepals linear, very acute, yellow, with the lower third purplish-brown; lip broadly ovate acute, yellow, with purple spots at the base.

CHERRY LÉON LECLERC, *Bulletins d'Arboriculture*,

July. A small but prolific and highly-flavoured Cherry.

CHRYSANTHEMUM VICE-PRESIDENT BARIGNY, *Revue Horticole*, July 1.

CLERODENDRON TRICHOTOMUM, *Garden*, June 17.

CUCUMIS SATIVUS VAR. SIKKIMENSIS, *Garten Flora*, t. 1392.

DIANTHUS HYBRIDUS PRINCE BISMARCK, *Neubert's Deutsches Garten Magazin*, July.

EPIDENDRUM UMLAUFTI, *Zahlbruckner, Wiener Illustrirte Garten Zeitung*, t. 2.

JUSTICIA CARNEA, *Revue de l'Horticulture Belge*, July.

LYCASTE SKINNERI VAR. PURPUREA, *Lindenia*, t. 379.

MAXILLARIA CALLICHROMA, Rehb. f.; Rolfe, in *Lindenia*, t. 377. The three long narrow sepals are white at the base, and yellow at the tips. The petals are of the same colour, but recurved below the middle, and again near the summit; lip three-lobed, the front lobe white with a yellow disc, side lobes purple.

PELARGONIUM CAPITATUM, *Revue Horticole*, July 1, woodcuts.

PLAGIANTHUS LYALLI, *Garden*, July 8.

RHODOCHITON VOLUBILE, *Garden*, July 1.

STRAWBERRY, THE COMET, *Bulletins d'Arboriculture*, June.

TEA ROSE, ETHEL BROWNLOW, *Gardeners' Magazine*, July 1.

TRICHOMANES PETEASHI, Gray, *Meehan's Monthly*, June.

ORCHIDS.

MESSRS. SEEGER & TROPP, LIMITED.—The compact little nursery at 112, Lordship Lane, East Dulwich, has always a number of interesting things, as well as the showier specialties of Vandas, Masdevallias, and Cypripediums, all of which are well represented there. The Vandas, consisting chiefly of varieties of *V. suavis* and *V. tricolor*, are in a very good state of cultivation, and occupy the greater part of one house. To these have lately been added a fine importation of *V. cerulea*, *V. (Esmeralda) Cathcartii*, and another promising species, which is supposed to be *V. Arbutnotiana*. In the same house are a fine plant of *Renanthera Storyii*, supposed to be the largest in cultivation; the extremely rare *Sobralia Beyeriana*, a large mass of the old, but still not common, *Aspasia lunata*, and other rare species.

The collection of Masdevallias has been very difficult to keep in good condition throughout the late hot weather, and two expedients have been adopted in order to lessen the effects of the great heat. In one case, a large collection of the showy species have been placed outdoors, standing on inverted flower-pots placed in a set of large trays containing water, and arranged beneath the shade of trees. In the other case, the plants have been allowed to remain in their low, span-roofed house, but spent manure has been thickly banked against the walls, and short litter placed over the glass of the roof. Both these methods have been productive of good results. But few of the Masdevallias are in bloom, but we noted the rare *M. guttulata*, *M. calura*, *M. Peristina*, *M. gibberosa*, and a quantity of *M. infracta*, varying from nearly white to purple.

In another house we noted the curious *Angræcum armeniacum*, with flowers somewhat resembling those of *A. bicaudatum*; *Bulbophyllum brevidens*, several pretty *Ocmeomeria* and *Pleurothallis*, *Sarcanthus insectifer*, *Cælogne Thuniana*, and among fresh imported things, a grand lot of *Cymbidium Devonianum*, *C. eburneum*, *C. Mastersii*, &c.

CATLEYA LABIATA GASKELLIANA.

Flowers of two beautiful and dissimilar varieties of this free-growing and useful *Catleya* come from the gardens of Joseph Broome, Esq., Sunny Hill, Wandsworth. The one has grand flowers, over 7 inches across, the petals being 3 inches wide; the whole flower is of a bright rosy-lilac, with a base of a yellow colour, the front of the labellum of a rich crimson. The other flower is of a pale blush hue, without a blotch of crimson on the lip. It is a charming form. Both flowers have the delicate fragrance usually found in the Gaskelliana division of *C. labiata*.

FAIR OAK LODGE.

The owner of this compact and pretty garden, W. A. Gillett, Esq., has, during the last few years, acquired a nice collection, the plants of which, under the care of his gardener, Mr. Carr, are in the best of health. In this part of South Hants (Eastleigh), Orchids are not much cultivated, therefore a collection like this one becomes all the more interesting. At the time of a visit made to the place recently, the following were in or just going out of bloom:—*Cattleya Mossiae* was represented by 130 spikes of grandly-coloured flowers, making a rare display; *C. Mendeli* was a prominent variety, so well was it flowered, as were plants of *C. gigas* and Veitch's variety of *Vanda anavis*. *Lælia purpurata*, and the white form of it, were in perfection of bloom; the somewhat rare *Schomburgkia tibicoides* had sixteen flowers on one spike. A house nearly full of *Odontoglossum Alexandræ*, *O. Pescatorei*, *O. (Miltonia) vexillarium*, *O. cordatum*, and *O. inoculatum* exhibited these species in their best forms, and made a fine display. *Epidendrum vitellinum majus*, *Cypripedium Warnerianum*, and *Dendrobium suavisimum* were noteworthy plants. *E. M.*

CARNATIONS.

MESSRS. VEITCH & SONS, CHELSEA:—The beds were well filled with flowering-plants, very floriferous, but like almost everything else this season, showing in their small blooms the lack of moisture in the soil. The rain had indeed come, but it was too late to do much in adding size to the blooms. We take the novelties by preference, viz., Ruby (Turner), cerise-pink, a good thing, but this year it wanted shade to bring out its beauty; Queen of Bedders is another from the same source, of a red cherry tint. The Lady, a fancy Carnation, with a yellow ground, flaked and stained with scarlet—a fine flower, that is said to force well; another—Almira—is one of the best of this class. Grant Allen is a flower with a calyx that does not split, and possesses a long footstalk; it is a cherry-red self. Empress is a white self, not quite new, free in flowering, and the flower of good shape and substance. Amy Herbert is not what the florists would call a good variety of Carnation, the edge being fringed, but it is excellent for cutting, being very free; and equally fine for cutting purposes is the scarlet self, Montague. Another self is Border Maid, of a shade of flesh-pink. Winter Cheer has done well this year; Oxonian is a bright cherry-red self of much merit; as is Cantab, a scarlet self, with the true Clove scent; Sultan is a crimson self. In Dr. Parke we have a dwarf pink Carnation, with a good calyx, and altogether a capital variety. William Toby is a free-flowering dark purple self. The Earl of Beaconsfield is a dark crimson, flaked Carnation, one of the best of the dark flakes. Alice Ayres, now fairly well known, has done better this year than others. It is always a variety that may be depended upon to give satisfaction.

In Picotees and Pinks we noted nothing that is novel. The marginal colours of the Picotees, and the colours of flake and fancy Carnations in general, it was observed, have run a good deal this season.

The collection is a large one, and the plants succeed admirably, notwithstanding smoke, fog, and a want of light in the winter season, which render cultivation in a London nursery so difficult.

MR. JAS. DOUGLAS, BOOKHAM.

In one of the most picturesque localities in Surrey, and one where but little business is carried on except for the accommodation and entertainment of the thousands of excursionists who go from London every week during the summer time, has been established Edenside Nursery by Mr. Jas. Douglas, of Great Gearies, Ilford. Only about four minutes' walk from the Great Bookham Station of the L. & S.-W. Ry.—18 miles from Waterloo—is the spot that has been chosen, and here Mr. Douglas intends to cultivate his especial favourites for sale, such as Carnations, herbaceous Calceolarias, Cinerarias, and Auriculas. At present only one house has been erected, the dimensions of

which are 100 feet long and 18 feet wide, and a more admirable house for such plants it would be difficult to build. Two more houses will be erected shortly, and about 6 acres of land have been acquired, which will be available at Michaelmas. This nursery being in its infancy, until the other two houses have been built—and excepting a few Auriculas—the Carnations are the only plants which can be dealt with.

About ten days ago, when we had the pleasure to visit it, the house we have mentioned presented a glorious picture, being full of Carnation plants in full bloom. The finest varieties were there, including the whole of Mr. Martin Smith's seedlings, and many of very considerable merit, which have been raised by Mr. Douglas himself. The large experience that Mr. Douglas has had with this class of plants ensures good culture; the plants were all healthy in appearance, the "grass" plentiful and strong, and if some of the blooms were not quite so large as they should be, this is easily accounted for, when we remember the dry, scorching atmosphere that has prevailed, and at the very time the plants were all stood out-of-doors. Each section or group of this beautiful family is well represented by its very best productions up to the present date; and it may be seen that it is Mr. Douglas's intention to cultivate an exceedingly choice collection of named florist's varieties, as distinguished from merely decorative or border ones. On looking at the yellow-ground Picotees first, we noticed Mrs. R. Sydenham, a seedling raised by Mr. Douglas; pure in ground, it has an excellent rose margin, long calyx, and robust habit. Mrs. Henwood is another good thing, heavily suffused with rose, and particularly compact in habit; Hercules, one of Mr. Smith's latest seedlings, is a large, handsome flower, with rose edge, but it breaks its calyx rather frequently. A very free-flowering variety is Lilian; the yellow ground is pure, and the rose flaking very fine. Others we may mention are Mrs. Whitbourne, Eurydice, and Diomede, a large Picotee, with very pretty yellow ground, and rose fringe (Douglas).

It is easy to select a few pretty bizarres of exceptional quality from the collections here. Phœbe (Smith) is a pink and purple-flake, tube long, the habit and form excellent; the flaking most harmoniously mixed. Then there is Chas. Henwood (Douglas), a purple-flake; the flowers are large and striking, deserve considerable commendation. Miss Constance Grabame (Smith) is a type of what a scarlet-flake ought to be—the scarlet is thoroughly distinct and most brilliant, and the form very fine. Gregorius (Douglas) is a pale scarlet flake, the flower rather thin, but of good form, and the flake excellent. One of the best of the rose or red-edged Picotees is Ganymede; it obtained a First-class Certificate last year, is of good sturdy growth, and the flowers are heavily edged with red. Desdemona is pure white, with pretty rose edge; flowers not extra large. Melpomene is another fine one in this section.

The self Carnations are, perhaps, after all, as useful and as fascinating as any of the numerous groups, and here we see some of the most excellent types yet produced. Duke of Orleans (Smith) must be acknowledged a decided advance upon Germania, both in colour and growth; Hayes, scarlet (Smith), has a large flower and splendid petal, of the most wonderful scarlet; The Hunter (Smith) is of fine form, and a deep Apricot colour; Corunna is, perhaps, one of the prettiest of Mr. Smith's self-coloured varieties, primrose-yellow in colour, and it has a remarkably strong habit; Louis Philippe (Smith) is a flower very similar in colour to the last-mentioned, has a fuller and more dense flower, and its short petals have wavy margins—a very effective flower; a velvety dark crimson of good form and large flower is Mephisto (Smith); and Waterwitch (Smith) is a delicate bluish-white, full and large flower.

A very fine group of King of Scarlets (Douglas) will thoroughly convince any who have the pleasure of a like glimpse of the value of this for effect. Its petals are broad, and the colour of exceptionally

bright scarlet. Oriflamme (Douglas) took the special prize for twelve bunches of a seedling Carnation last year at the National Carnation and Picotee Society. It is bright scarlet, and altogether free from objectionable features. Lady Marie Currie is a large flower of delicate fleshy rose colour, of value as being a good self, and has been obtained from the fine flaked variety of this name; both the forms are good, and will be propagated for sale. Mrs. Louisa Jameson has a perfect bloom in form, with very smooth edges, in colour it is dull red. Other good ones are Abigail, Niphetos, and Royal George, the latter a good purple if it were less inclined to force the calyx.

We have referred to the best of those we noticed when at Edenside, but there are many to which we cannot do justice, and a number of unnamed seedlings, which will undoubtedly be heard of later. Mr. Douglas has made a good start, and we doubt not but that he will meet with success.

MR. F. GIFFORD, WHITE HART LANE.

At this place, and about 1 mile from Tottenham, Mr. F. Gifford acquired, some two years ago, what is now known as the Montague Nursery. What until then was a farm-field has been transformed, until now it is well covered with herbaceous plants and Carnations; it is to the latter, however, that more care is given, and upon which most interest centres. Mr. Gifford has had considerable experience, for it was only a few minutes after we first met that we elicited the fact that he was an old "Kewite;" and beside many other places, he has had a considerable time at the Hale Farm Nurseries of Mr. Thos. Ware. Evidently Carnations are his pet subjects, and the border varieties, rather than the fancy and wonderfully-edged flowers of the florist.

When we visited this establishment, we found that there were many thousands of plants in rows in the open, and the only building consisted of a few frames, so that pot culture is not at present practised to any extent. Of the border varieties, however, there were many very fine ones, most of the old ones that are really standard varieties, and can still claim recognition in the face of their newly-born rivals, were there, and in good groups, and what new ones we noticed were principally varieties that have been raised by Mr. Gifford himself, some of which are deserving of note and praise. Empress is not new, but it is a seedling of Mr. Gifford that looked extremely well—a useful white one; Leander, another one, and of a pretty yellow, has good stiff petals and worthy of a place in most borders. A good scarlet is that named Montague, whilst a magnificent white one, flowers very delicate and light, especially useful for decoration, has been called Mrs. F. Gifford. Brethardt is an especially noteworthy variety, a good doer, compact in bloom and of deep purple, which, when the bloom is passing, goes almost black. Amy Herbert is a bright pink colour, pleasing, and its petals are wide and good; and a good robust grower is Professor Goodheart. Mrs. Frank Watts is a yellow seedling of considerable merit; and Fair Rosamond is a large white flower, sometimes having a splash of scarlet, but not often. It throws the petals well back, and would be extremely desirable if the calyx would not split. Two other good border varieties are Edith Brill, clear white, and good smooth petals; and Cantab, a very fine scarlet, powerfully scented. The best of all the seedlings, however, is that called Duchess of York, and noticed in our columns on p. 48. It is a good grower, and is the earliest to bloom of all the varieties that Mr. Gifford has in the open ground; the delicate flesh-colour is exceedingly pleasing, and the flower is large and full.

SUMMER PRUNING.

The accompanying figures serve to illustrate the system of pinching fruit trees, a matter now attracting much attention, and show the effects of the process in a period of three years. The operation of pinching the young shoots is commenced nearest the leader, sometimes only one, two, or even three at the same time, according to circumstances, as soon as they are from 2½ to 3 inches long, as seen in figs. 27 and 28, at *a, a, a, a*, all other shoots being allowed to grow till they are a certain length, when they in turn are pinched at *b, b, b*, in fig. 28. Severe pinching often causes the shoots operated upon to die off, as will be seen in fig. 27 at *c c*, and to convert the existing spurs into shoots. In general, however, the

FIG. 27.—SUMMER PRUNING. (SEE P. 100.)

young shoots after they are pinched will remain stationary, with only one or two leaves on them, and in the year following will form spurs, see fig. 27, *d d d*. Under certain circumstances, when the trees are very vigorous, they will break again, so that they require to be pinched a second, and even a third time, as will be observed in fig. 28, *ee, ff, and g*. When the tree is found to have too much sap, those branches which have been pinched a second or third time are left untouched at the winter-pruning, and they are only cut-in after they have produced some young shoots, which prevents a too great development of those branches. The branches *h, h* in fig. 28 illustrate the case, and they will be cut off at *i, i*. The dead stumps will sometimes produce spurs at their bases, as is seen at *k* in fig. 27. The pinching of the young shoots on the upright leading shoots differs a little from that practised upon the lateral branches. Supposing fig. 28 to be a leading shoot, instead of pinching the shoots, *a, a*, as they are represented, they should be allowed to grow to the length of the others, *b, b, b*, before they are pinched, so as to insure sufficient wood for the next winter-pruning.

HOME CORRESPONDENCE.

SUMMER PRUNING.—Your correspondent, "Extension," describing the shoot of an Apple tree sent to the editor of the *Gardeners' Chronicle* (p. 749, vol. xiii.), says, "Now, under the aimless pinching manoeuvres of Mr. Fish and 'W. S. C.' this shoot would have been much less productive, and worried to a stump, and the tree would have been about one-quarter its present size, and proportionally less fruitful." In reply to "Extension," I would say that I am not aware that the teachings and practices of either Mr. Fish or myself afford any grounds whatever for "Extension" to accuse us of teaching and following aimless methods of procedure. Speaking for myself, I can assure him that I am an extensionist myself in the matter of training fruit trees, and have practised and advocated extension for several years in the horticultural press, and in a work recently published by a London firm, my object, like that of many other fruit-growers, being to build up a fruitful tree in as short a space of time as is possible. To maintain it in vigorous health and fruitful condition as long as I can, I encourage a productive growth in the tree, pinching the summer-growths of vigorous-growing varieties two or three times during the season, so as to divert the flow of sap into useful channels, i.e., the promotion and formation of fruit-buds. Trees of less vigour are, on the other hand, treated accordingly, judicious and not indiscriminate pinching of the shoots being practised, and no "aimless" pinching permitted. It is a well-known fact that several varieties of Apple, Pear, and Plum are naturally free-bearing, and need but very little pruning of any kind, as they make but trifling superfluous growth, the energies of the trees finding an outlet in the development of the fruit and fruit-bud. In conclusion, I would make reference to the prolific "20-inch long Apple shoot" which "Extension" sent to the Editor in support of his condemnation of summer pinching. It is a pity that "Extension" did not give at the same time the name of the variety, the age of the tree, and the depth and nature of the soil in which it grows. This self-same shoot, "Extension" avers, would have been worried to a stump under the "aimless pinching" of Mr. Fish and "W. L. C." I should say that no practical man would consider it necessary to pinch such a tree as "Extension" describes. It has not, we are told, been root-pruned for more than fifteen years. The shoot of this tree, sent to lend emphasis to his remarks, is, as stated above, 20 inches long, and the full growth of three years, and was, as well it might be under the circumstances, studded with fruit-buds and Apples, having an average of a little more than 6½ inches of growth for each year! And this shoot, we are told by "Extension," has never been "pinched or pruned!" and that the tree from which it was taken was planted by himself, and is past the "gross stage!" Truly the growth was sufficiently "pinched and pruned" by Nature to render artificial pinching and pruning unnecessary. It would be interesting and useful to have the particulars as to soil furnished, and to know if all "Extension's" orchard and wall trees make the same fruitful growth as that from which the branch was cut, and his means for checking gross growth. Trees growing in a light shallow soil on a gravelly subsoil will neces-

sarily make less growth than would the same varieties in a deep retentive loam, and require different treatment. Free-bearing varieties, as a rule, make a small amount of growth annually, and this is short-jointed, bristles with fruit-buds, and requires little, if any, pinching or pruning of root or branch. There is no use in "Extension" and "E. M.," coming before the readers of the *Gardeners' Chronicle*, which is a very large and important one, with the side-issue of a question of national importance. *W. L. C.*

ROOT-PRUNING.—I do not think Mr. Crowley is altogether justified in attributing, as he does at p. 15 of the *Gardeners' Chronicle*, July 1, the bad set of Apples, and the subsequent dropping of the fruit that did set, to the fact of his trees having been root-pruned, as the principle, under certain conditions, is perfectly sound, assuming that the work is skilfully carried out, and as it appears to have been done in this case. Of course, no practical man would for a moment think of root-pruning a fruitful tree—that is, a tree which bore fairly good crops of fruit every year, when the blossom escaped injury by frost, and which consequently make growth sparingly, this being, as a rule, short-jointed and consolidated, and only sufficient to maintain the tree in a healthy condition. As a matter of fact, trees growing in light shallow soil, resting on a substratum of chalk or gravel, rarely, if ever, need root-pruning. It is almost certain that Mr. Crowley's trees would have behaved in an identical manner had they not been root-pruned at all in the last or previous year, as it is certain that there was no moisture left in the soil surrounding them, which an extended growth of root could have absorbed at about the time the fruit dropped from the trees. In the 4-acre orchard at this place, as well as in other places in the district having the same kind of soil (light), the sheets of blossom with which the trees were clothed flagged so badly towards the end of the month of April through sheer lack of moisture in the soil, that they were nearly all parched up by the tropical heat which has prevailed up to last week, and these trees had not been root-pruned for several years. Some fine specimen Apple trees in the park a few hundred yards distant from the orchard in question, were similarly affected, and with the same result of stunted growth and very thin crops of unusually small dried-up-looking fruits. Mr. Crowley states, towards the end of his note, "from the result of this year I think root-pruning may be carried too far." This is quite true, and, according to his own showing, I am inclined to think that he erred in that direction. "For some time," he says, "these trees which are now six or seven years old, had, when the growth was over-luxuriant, been root-pruned, and the roots shortened back to about 2 feet from the stem, and the ground made up with good loam and brick-rubbish." Thus it would appear that the trees had been root-pruned at least two or three times during the six or seven years of their existence! I should say that trees which had been root-pruned and treated in the manner described by Mr. Crowley, say, the end of September, 1891, would, as the result of that operation, have emitted a mass of fibrous roots during the interval elapsing between then and February, 1893, and these small roots would have pushed into and gathered more nutriment from the surrounding soil than the unpruned trees would have done growing at the same depth and in the same kind of soil. Fruit trees which had been root-pruned after the fall of the leaf last autumn would not, as your correspondent points out, have had time to make much root-growth before the spell of hot dry weather set in early in the month of March last, and therefore would feel the pinch if they were not watered and heavily mulched as trees are generally after being root-pruned. In conclusion, I repeat that the principle of root-pruning under certain conditions is sound, but sometimes, as in the case of Mr. Crowley's trees, the conditions of the weather closely following upon the operation, were unfavourable to the well-being of the trees. *H. W. Ward.*

—The indictment brought by Mr. Crowley against the practice, or, shall I say, the art, of root-pruning is a severe one; and, although not by any means an enthusiast in its favour, I should like to point one or two things in relation to what has been written that may merit attention. In the first place, and apart altogether from the nature of the weather we have had this year, did the requirements even of the severest form of root-pruning compel the cutting back of roots only 2 feet from the stem? I should say not so, most certainly. For trees some six or seven years old I should not

have root-pruned nearer than $3\frac{1}{2}$ feet at the most, and then to have found and severed roots only that were large and productive of gross wood. Where roots were cut all round, as seems to have been the case at 2 feet from the stem, I think that was practice which no root-pruner, however enthusiastic, would justify. Obviously, root-pruning is a part of the system of artificial culture which must prevail so long as fruit is produced under modern conditions. If trees have to be of certain forms and sizes, and restricted to prescribed areas, there is no other course open but to check branch or wood developments, for mere top-pruning will not secure the desired result. Then, it is well known that free roots means free growth, and where the soil is deep and good, free growth means unbounded wood production, and little fruit. In thousands of cases the pruning of the roots, where done with judgment, has produced the happy mean and plenty of fruit. The nurseryman who grows his thousands of trees is practically always root-pruning, because he annually lifts and replants his trees, but he does not unduly injure the roots by severe cutting. The private grower can hardly lift his trees every year—indeed, prefers not to have to lift them at all, but does so sometimes at intervals usually with good results. Generally his root-pruning consists of severing the largest roots a few feet from the main stem, and that drastic remedy is rarely finished in one season, as it is good practice to root-prune one-half the tree in each of two successive years. Now, it is obvious that where root-pruning is done, some special assistance should be given to the tree to help it weather the first season, if needed, both by liberal mulching and watering. Never within the memory of man, perhaps, has such treatment been needed to even many established trees, more fully than this year, much more, therefore, to hard root-pruned trees; nay, many large trees, never root-pruned, have suffered even worse than have Mr. Crowley's, for I have but recently seen on good holding soil, fruits lying about thickly beneath, cast off by the trees entirely from want of moisture. Such being the case, is it fair to condemn root-pruning from such a comparatively isolated failure as the present exceptional year has produced, especially when, as admitted, the pruning seemed to have been hard almost beyond precedent? But even in that case, with ordinary care, had we experienced an average moist season, would there have been failure to produce a crop? I think not. *A. J.*

—I have carefully read Mr. Crowley's case, pp. 15, 16, and can only marvel that he did not water his trees before losing the fruit, if that was at all possible, rather than describe this obvious cause of loss so clearly after it had shrivelled up, and fallen. We root-prune fruit trees, lift their roots nearer the surface, and limit their area to 2 feet run from the bole, and from 18 inches to 2 feet deep from the surface; and we are bound to come to their assistance during such a spell of three months drought as we have had. Mr. Crowley's logic is quite sound. Place a tree vertically in a pot—practically, it matters little whether it be in a pot or tub, or a limited area of ground—and to maintain it and its produce in health, it must be subjected to good culture as to water, and, to some extent, heat. Had Mr. Crowley shut in the moisture, and shut out the sun-heat with a good surface mulch of spent manure or litter for 6 inches to a foot thick, his crops would have been safe. Neither should root-pruning be carried too far, nor repeated too often. It is a heroic remedy for the stinky complaints, meagre crops, or absolute sterility, but as soon as it has forced the trees into fertile ways it should be allowed to fall into abeyance. The practical men will easily see whether or not it should be repeated. But as fertility is almost sure to repeat itself, and as root-pruning should result in fertile roots placed at the most fruitful depth, the probability is that root-pruning may not need repeating often or at all in the life of any particular tree. One great difficulty with many cultivators is to get them to start in such useful directions as root and summer-pruning. But a greater difficulty is to get them to stop when the operation is no longer necessary. *D. T. F.*

—I have read with interest Mr. Crowley's note on the above, and with regard to our getting too artificial in the culture of fruits, I think, as yet, we have a little more to learn and practise before we are perfected. In a season like the present one, the like of which may not occur in a life-time, trees, be they root-pruned or not,

are casting their fruit in many gardens from lack of moisture in the soil, so that it is scarcely the kind of season to build any sound theories or practice upon. That root-pruning may be carried to extremes does not admit of a doubt, and cases in which that is so are not infrequent; but the root-pruning of fruits, when it is properly carried out, has good results. There are, however, a few points in the practice which should be duly considered before any interference with the roots is commenced. We have to take thought of the nature of the soil, its quality, depth, subsoil, and drainage; and then the room, whether the heads of the trees are restricted, or allowed to grow in size. If the trees are standards, and planted at a good distance apart, and the soil is fairly good, resting on a well-drained subsoil, I would say, "Don't touch the roots, and prune the tree sparingly after the foundation of the head is formed." The trees, good sorts, will soon come into bearing, after which time they will need liberal treatment. The case is different when space is limited, and the knife must be freely used to keep the trees within the allotted space, and the roots must then be taken in hand. I have root-pruned several trees in this garden at various times with good results, but not large trees, at one operation; I always do these in twice, the work being done in the autumn. In the case of young trees in orchards, the pruning is frequently over-done; and if the branches were allowed a little more freedom, the trees would produce sooner more fruit-bearing wood, but at no time should the heads become crowded in the interior with small shoots, which lack of light and air render barren and useless. Moderate extension should be the aim of the orchard cultivator, and it is doubtful whether, in the majority of cases, the roots of standard Apples and Pears should ever be pruned, provided the roots were evenly spread out, and not buried too deep in the ground at the time of planting. *H. Markham, Mereworth Castle Gardens.*

—Mr. Crowley does well in calling attention to this matter in his note in a recent issue of the *Gardeners' Chronicle*. I am sure that root-pruning is too much resorted to. I allude to those persons who may be called the older school of gardeners. There is certainly less root-pruning practised now-a-days, and I will venture to say that more fruit is obtained under what may be termed the newer system, which is simply to let the roots alone when the trees have been planted in the right manner. I assert that Apple trees, in the majority of cases, can be so managed as to bear full crops of fruit without ever root-pruning them at all, no matter how rampant the growth. The exception to this rule is generally when the trees have but limited space to grow in; for instance, those planted close alongside the garden paths. Strong growers, as Warner's King, Bismarck, Gascoigne's Scarlet Seedling, or Grenadier, sorts which occur to one at the moment, cannot readily be induced to bear freely when the space allowed the trees is not large enough for considerable development. It is sometimes requisite to plant rather thickly so as to obtain a collection of Apples for kitchen and dessert uses; but it is then useless to expect the trees to make much growth and to bear fruit in sufficient quantity to satisfy the average of cultivators without restricting the roots in some way; and root-pruning is absolutely necessary to gain the end in view, and to lessen the growth of branches, and induce the formation of fruit-buds. If under the conditions such as those Mr. Crowley points out the trees were root-pruned, and no opportunity presented itself to supply the trees with water after the fruit was set, there are still three other devices open to the cultivator to hinder the fruit from dropping in large numbers: first, by thinning it to a reasonable quantity on each tree directly it can be seen which are the most promising fruits, a very important point with young trees, which should not be over-taxed whilst young, especially if the roots have been recently interfered with. I not only thin the fruit on all the young trees here—100, or more—but the bloom-buds are lessened in number, which relieves the strain on the trees. The second point is to mulch the roots with partly-decayed stable manure, or with leaf-soil, wood-ashes, and decayed vegetable refuse. Those who do not practise mulching when watering is not possible, cannot realise the benefits derived by the trees from the practice, not only so far as the current season's crop is concerned, but the following season. When the roots are exposed to a hot sun, and the ground is rendered hard by the winter rains, the roots are driven down in quest of moisture, not finding it at or near the surface, with the consequence that much strong growth is made. The

FIG. 28.—SUMMER PRUNING. (SEE P. 100.)

third and alternative practice, where neither watering nor mulching can be carried out, is to maintain the surface soil continually in a loose friable state, to prevent its cracking, and affording openings for the escape of moisture by evaporation. By this means alone I have been enabled to keep some hundreds of Apple trees in a thriving state during the recent hot and dry weather, and preserve a full crop of fruit on them, too. The trees in question were planted in the autumn of 1890 and winter of 1891, and not a drop of water or a handful of mulching material have I been able to provide them with, but I am satisfied with the results. I will now refer to some trees which have been planted about six years, and have, as yet, not borne a good crop, but have made abundance of wood. Some persons would say, the only way to make these trees fruitful would be to root-prune them. This, I say, is absolutely unnecessary, except in the case of one or two sorts, where the width and height are available, which I may assume is always obtainable in an orchard. There may be other reasons why these trees make so much growth and so little fruit; in the first place they may have been planted too deeply, and if that is so, it is useless to expect fruit in quantity until the roots are brought nearer to the surface, and enabled to derive more benefit from sun-heat than is otherwise possible, and induce the forming of fibrous roots, which would bring about better ripening of the wood, which alone is the means of obtaining abundance of fruit. Simple root-pruning of such trees might check luxuriant growth, but it would not ensure a crop of fruit. The evil of deep planting in heavy soil is a serious one, and I should, under such conditions, replant the trees, bringing the roots near to the surface, and by care in regulating the branches, mulching the soil, and so on, I should expect in a very few years a full crop of fruit; and once this is obtained, there should not be much difficulty afterwards in having an annual supply, unfavourable seasons of course excepted. If trees are planted in such a manner that their roots are near the surface, whether they are standards or bushes, no matter how vigorously they grow, it is unnecessary to root-prune them, but there should be no close pruning or pinching of the leading shoots; and the branches should be bent outwards in such a manner that all parts of the tree can receive a full share of light and air. Surplus shoots not required for filling gaps in the tree, being pinched in the month of June, to within 3 inches of their base, allowing the leaders to extend at will; and assuming that the latter have reached from 2 to 3 feet in length by the autumn, instead of pruning them back to within 1 foot of their base, or less as some do, I cut off the tip at about 6 inches, as a means of inducing the buds behind to plump up, and form either fruit-buds eventually, or lateral shoots to furnish that part of the tree in the near future. Where the leading shoots are less than 2 feet long, and these promise to push their base-eyes, as well as those situated nearer the point, I do not interfere with them at all, but allow them to grow. The season following, the trees will be found to be less productive of wood, and there will be more signs of a fruit crop. By the let-alone-plan, or a modification in pruning, the trees very soon exhaust themselves of much, there is less of gross growth, and this is followed, as everyone knows, by a full crop of fruit. The less growth of an objectionable kind is apparent, the greater will be the increase in fibrous roots. Persons who have a heavy soil to deal with, would act wisely in planting their trees on the surface, and forming a slight mound over the roots, just sufficient to cover these. In all this, I assume that the land has been properly prepared, by digging the soil to a depth of not less than 18 inches. If this method of planting were more practised than now, we should hear less lamentation about the fruit crops, the need of root-pruning, and canker of the branches. There is another aspect in the question of Apple-growing, viz., the obtaining the greatest amount of crop in the shortest space of time. I allude to the question of stock upon which the trees are worked. I know some persons stick to the Paradise stock, but give me trees that are worked upon those of the seedling Apple stocks, raised mainly, I believe from the pips of cider Apples. Some persons aver that the Paradise stock induces an earlier fruit crop, but that is impossible, as I have experienced in the heavy soil of this place. Give me a tree worked upon a seedling Apple stock [Crab?] for freedom of growth, early and continuous bearing. Waltham Abbey Seedling and Ashmead's

Kernel Improved are varieties of Apples which have given me the most trouble in inducing them to bear anything like a full crop of fruit; and for several years I tried them upon the let-alone principle, but I was compelled at last to severely root-prune the trees. Now I have no trouble whatever with them. *E. Molyneux.*

ACHIMENES LONGIFLORA.—On looking through the tents at Chiswick last week, I noticed a small collection of Achimenes nicely bloomed, some of which were marked "new," one being Achimenes longiflora. This must surely, I thought, be a mistake, and on referring to my Thompson's *Gardeners' Assistant*, p. 807, on reaching home, I found in the list of varieties there given, "A. longiflora major, large flower, blue." I know that we used to have forty years ago both A. longiflora and a rather larger flower, A. l. major, neither now cultivated so much as they deserve, people running after the gaudy but far less elegant tuberous Begonias. All the same, we ought not to have a plant as "old as the hills" dubbed new. *The Old-un.*

EUCALYPTUS AND THE "TIMES."—In the *Times* of Monday it was stated, in an article on the colonies and a paragraph about Uganda, that it was useless to congratulate Sir Gerald Portal on his Eucalyptus planting, because that tree (varieties were ignored) takes six months to sprout and sixty years to become a tree. Whence the *Times* correspondent's experience has been derived I do not know, but I myself have planted the Eucalyptus in good soil, under a hot sun, and in eight months had my seedlings of 1 foot high become small trees of 9 feet high—an average growth of a foot a month, which few other plants can rival; and I have seen the Eucalyptus in thirty years become a magnificent forest tree. *D.*

AVENUES OF ELMS.—Has your correspondent who made enquiries on this subject seen the avenues near Ham House, Petersham, the residence of Earl Dysart? *X. Y.*

WHICH IS THE EARLIEST PEA FOR MARKET PURPOSES, LIGHTNING OR ECLIPSE?—I notice in the issue of the *Gardeners' Chronicle* of June 17 a paragraph relating to "High prices of growing Peas," from which comparisons may be drawn by novices in Pea culture as to which is the earliest variety. Practical men are, of course, aware that to do so would lead to erroneous conclusions; there cannot, however, be any denial of the fact, that £18 10s. per acre is a remarkable price for Lightning, which appears to have been realised about June 8. The following incident, which I have not seen noted in the press, was probably not considered by those immediately concerned of sufficient importance to call the attention of the public to it at the time. It is a fact, nevertheless, that on May 17, three weeks before, a field of the Eclipse, measuring a little over 2 acres, was sold by Messrs. Moore & Son by auction in Tewkesbury market, which brought the still more remarkable price of £45 for the lot. Here, then, is a case in which some may reasonably infer that the blue Pea was the earlier of the two. We frequently see in the pages of the horticultural press notices of the earliness of certain individual varieties of the Pea tribe, and without questioning the *bona fides* of the reports given, unless these are tried against others of the same class, and under the same conditions, they are really mere testimonials in favour of the skill of the cultivator and the resources at his command, and no criterion as to the intrinsic merits of the Pea itself. Now, I think it would be of the utmost value if a market grower who had grown the two Peas in question in large breadths, say, by the acre, and under exactly similar conditions, would give us the benefit of his experience. Mine has been, so far as Lightning is concerned, that it is much after the style of the old Ringleader and Carter's First Crop—very suitable for a gentleman's garden, where extra attention and protection can be given, but too tender for field culture, while it is too pale a green to be attractive to market buyers; consequently my old favourite, the Eclipse, being of a hardier constitution, reaches a marketable state, all things being equal in its cultivation, generally before its electrical competitor. *An Old Gardener.*

MILDEW ON PEAS.—When at Rousham Park, Oxfordshire, at the end of last summer, I was much struck with some lines of Ne Plus Ultra Peas, which appeared to be entirely unaffected by mildew at a season of the year when this variety is often much subject to it. I found that Mr. Wingrove, the gardener, immediately upon the mildew putting in

appearance, dusted the soil about the roots and the lower part of the foliage with soot, with the result that the spread of the mildew was at once checked. While the Peas were matured by the soot being placed upon the soil, Mr. Wingrove stated he always found soot to be an unfailing remedy against the mildew. *R. D.*

LINUM GRANDIFLORUM.—Blue, rose, and white, are known garden varieties, parentage uncertain; the crimson-red *Linum* is indigenous to Algeria, and is probably a distinct species, although generally permitted to pass as a garden variety. It is hardly fair to make our seed list answerable for a general horticultural error. *S. A., Harlesden, N.W.*

IMPROVED WROXTON ONION.—This is one of the best keeping Onions in cultivation, testimony to this effect being borne by some of the leading Onion cultivators in Oxfordshire. It is of a large globular shape, intermediate in tint between the brown and the White Globe varieties, and when matured it takes on a golden-brown skin colour. In its long-keeping quality it follows the old Brown Globe, or James' Keeping, which might have been one of its parents. I was at Rousham Park, Oxon, last summer just as Mr. Wingrove had pulled his crop of the Wroxton Onion; they were of good size, even, and very solid and heavy. As the old school of Onion growers held to the Brown Globe as a keeper, the newer school are equally satisfied with the Wroxton. *R. D.*

THE R.H.S. EXAMINATIONS.—I would like to suggest that following upon the publication of the questions set in the respective grades at the recent Royal Horticultural Society's examinations, should come the publication of the answers by the leading candidate in each grade. These would prove of educational value, in helping novices in examinations to understand the sort of method and matter required from them at any future examination. The great thing just now is to encourage effort in this direction, and there is an immense amount of timidity to overcome. In the meantime, the publication of the replies being deferred for a few weeks, it would be capital practice did prospective candidates but have a try at the questions, and then see, when the best replies are published, how near they may have arrived at exactness. Work of this kind should prove of exceptional interest, as well as of value to young gardeners. *A. D.*

SEED CATALOGUES: THE TRUE LORD ANSON'S PEA, LATHYRUS MAGELLANICUS.—This plant disappeared suddenly from commerce nearly forty years since, and *L. azureus*, in a Mahatma-like manner, appeared in its place, and has been tacitly supported in its usurped position throughout seed-growing Europe. The original species is being sought after, and may soon be reinstated. *S. A.*

BLUE HYDRANGEA HORTENSIS.—I remember, many years ago, when living at Linton Park, Kent, under the late Mr. J. Robson, all of the above plants, which were growing in a certain part of the park, produced flowers of a blue colour; the soil was a stiff clay, and contained a quantity of iron. Cuttings taken from these plants and flowered in pots invariably gave pink flowers of the ordinary kind; in another part of the grounds, where we had a light limestone soil, the plants always had pink flowers. I have somewhere seen a statement that a solution of alum given to the plants occasionally before flowering commences, will cause the flowers to become blue, but have not been able to try it here, as the plant is too tender for this place. *W. H. Divers, Ketton Hall Gardens, Stamford.*

SOCIETIES.

ROYAL CALEDONIAN HORTICULTURAL.

JULY 12.—On this date considerable enthusiasm among all classes of horticulturists was witnessed in the Waverley Market, by exhibitors who came from far and near, to show their devotion to the queen of flowers. Though rain had fallen heavily the day previously, and on the show day also, the Roses were tabled in wonderfully fine condition. The nurserymen came forward in their usual strength, but gardeners and amateurs were not more than half the number which are often taking part in the contests at this season. Plants and fruits also held prominent

positions at the summer shows. The former were less than usual, but fruits, especially Grapes and Peaches, made up for a deal which was lacking in the other classes. The entries were 170 of plants, 140 of cut flowers, 101 of fruits, and 200 of vegetables. In the nurserymen's classes there were 20 of plants and 80 of cut flowers. The tables filled with plants and cut flowers from the local nurserymen as usual were conspicuous in the large hall, and many objects of beauty and interest were exhibited. Entering at the east end a brilliant display of Pansies and Violas were most attractive, by a table well-filled from Dickson & Co., who had their choicest flowers on exhibition. Among Pansies, Holyrood, White Sylvia, Tory, Dorothy Tennant, and Bullion, held their own among many novelties. The centre of this table was ornamented with Palms, and the margins were neatly clothed with dwarf Ferns, Roses, and other cut flowers. From this firm was also a good collection of Carnations and Cloves, in pots and as cut flowers, in variety.

From Messrs. Methven came a fine collection of Figs in pots, loaded with fruit, Brown Turkey, Negro Largo, White Marseilles, Brown and White Ischia, and Brunswick were the most promising for small-pot culture. From the same firm was also a collection of Clematis in pots; White Eucharist, Lord Nevil, Lady Bovill, Gipsy Queen, Duchess of Teck, and Princess of Wales were among the choicest. They were placed with numerous Lilies, auratum platyphyllum being specially attractive. From Mr. Watt, Newstead, came an attractive exhibit of *Disa grandiflora*, about five dozen plants in small pots. Beside these was a very interesting collection of alpine plants from Mr. Cuthbertson, Rothesay.

Messrs. Laing & Mather, of Kelso, were, as usual, strong in Carnations; their Lady Nina Balfour (a pale pink Carnation) was again exhibited, and showed its fine character, with strong stems and bold flowers. The yellow Germania and pink Malmaison were in fine condition.

Collections of alpine plants from Messrs. Cocker, Aberdeen, had their admirers; and a table of *Arancaria excelsa*, in various sizes, from Mr. Phillips, Granton Road Nurseries, were finely arranged with Ferns, Carnations in pots, and plants with striking foliage.

A finely-arranged table of flowering plants, interspersed with Ferns and many plants with fine foliage, came from Mr. John Downie, Beech-hill Nursery, the glass in which is to be devoted to the class indicated. Double Begonias (*Triomphe de Nancy* was very fine), *Dracana Lindenii*, and some well coloured Crotons gave a fine effect to the gay flowers.

The tables arranged for competition were confined to gardeners. Mr. Geo. Wood, Oswald Road, was 1st, with a display of Crotons of fine colour, Lilliums, Vandas, a few *Odontoglossums* (grande), *Thunia Marshalliana*, *Dracenas*, &c.; Mr. A. Crichton, gr. to Mrs. Croll, was placed 2nd, with a very fine table arranged for effect.

Stove and greenhouse plants were contested in the various classes by Mr. McIntyre, The Glen; and Mr. Bald, Cannon House, but not equal to what these keen exhibitors often table in the Waverley market.

Foliage plants brought forward stronger and better competition, Mr. Crichton, Liberton, taking 1st prize—*Dracena angustifolia*, *Pandanus Veitchii*, and a variegated Pine-apple were in fine health and colour. Mr. John Forester as 2nd had well-grown *Dracenas*, and a fine Croton *Williami*. Mr. McIntyre was 3rd, with finely grown plants of *Tillandsia Zebria*, *Rhopala corcovadensis*, *Dracena Lindenii* (finely coloured), and *Alocasia Sanderiana*.

Passing long tables of Ferns, Palms, *Dracenas*, *Fuchsias*, Alpines, cut flowers in great variety, we stopped at the long line of table plants, where Mr. John Downie was placed 1st with twelve neat and healthy plants. Croton *superba*, C. Thomson were prominent in this exhibit. Messrs. Laird was a good 2nd. This long line of plants separated the Roses, and was effective.

The Roses were most attractive, and crowds assembled round the tables throughout the day. For forty-eight distinct varieties, the 1st prize was awarded to Messrs. Croll, of Dundee. These were of high colour, and the flowers spotless, many of which were of great size. Her Majesty, Ulrich Brunner, Maid of the Mist, Countess of Oxford, Comtesse de Serenye, Chas. Lefebvre, Silver Queen, *Séateur Vaisse*, Marguerite de St. Amand, Duchess de Morny, Viscountess Folkestone, Marie Van Houtte, S.-M. Rodocanachi, Francis Lacharme, Marguerite de Roman, Madame Victor Verdier, Lady Alice, General Jacqueminot, White Lady, Mons. A.

Lafère, Merveille de Lyon, Prince de Rohan, Marie Baumann, Madame Lambert, Gloire de Margottin, Barones Rothschild, Heinrich Schultzeis, Margaret Dickson, Prince Arthur, Lady Mary Fitzwilliam, Etienne Levet, The Bride, White Baroness, Mons. E. Y. Teas, Louis Van Houtte, Mrs. John Laing, Rosieriste Jacobs, Souvenir de S. A. Prince, Duke of Edinburgh, Violette Bouyer, Constantin Tetriakoff, Marchioness of Dufferin, Victor Verdier, La France, Harrison Weir, Helène Paul, John Stuart Mill completed a most creditable collection. The 2nd prize went to Mr. Dickson, of Belfast, with a fine collection, but we have seen that distinguished cultivator table finer blooms; they had been slightly injured by rain, but many remarkable flowers were in this exhibit. Mr. Cocker had a good 3rd.

For twenty-four blooms, Messrs. Cocker took the lead; Prince Arthur, General Jacqueminot, Duc de Rohan, Margaret Dickson, La France, and White Lady were of fine form, colour, and of good size. Mr. Croll was 2nd, and Mr. Smith, of Stranraer, 3rd; both of these exhibitors also showed well in this class.

For twenty-four Teas, Messrs. Cocker & Sons 1st prize; the most of their flowers were very finely formed. Devoniansis, Souvenir d'un Ami, Princess Beatrice, Cleopatra, Souv. d'Elise, Rubens, and Madame Hoste were extra fine. Mr. Robertson, nurseryman, Helensborough, was 2nd; his Maréchal Niel, The Queen, and Archduchess Thérèse were of extra merit.

In the class of twelve trusses, three of each, Messrs. Cocker was 1st, and Mr. Croll 2nd. Great numbers of "Scotch" and Ayrshire Roses were exhibited by Mr. Cocker. Baskets of Roses and bouquets were in great numbers.

The gardeners' classes were not strongly represented. Mr. Henderson, Clemerston; Mr. Thomson, of Kinglassie; Mr. W. Parlane, Rosslea Row; and Mr. Harper, Perth, were the leading prizewinners, and they exhibited many remarkably fine flowers. It is worthy of remark that among the Scotch exhibitors there was less "dressing," or it might be termed disfiguring, of Roses, than we have seen. There is a rule in the schedule to disqualify these unnatural flowers, and we learned from members of council that this rule was to be put more strongly in force in future. We think it should have been applied with decisive force years ago. Nature may be assisted, but should not be distorted.

Leaving many fine exhibits of Roses unnoticed, we had to give a loving glance to some choice Orchids. Mr. Wood, gr., Oswald Road, was 1st, with Cattleya Sanderiana and Vanda suavis in good form; and Mr. Sharpe of Freeland was 1st, with a collection of four, Cattleya Gaskelliana, Odontoglossum vexillarium, Disa grandiflora, and Cypripedium Lawrenceanum rubellum. This exhibitor had a very good plant of Cypripedium Veitchii with fifteen fine flowers. Among the cut flowers and bouquets many good species of Orchids were prominent.

The fruit, especially Grapes, was of great merit in most of the classes. Pines from The Glen, Culzean Castle, and Archerfield, were fair for finish, though some would have been better elsewhere. A good rule to prevent small Pines, unsuitable for an exhibition table being exhibited, has been inserted in the schedule, which does not admit a Queen under three and a-half pounds, and Cayennes not less than five and a-half pounds.

The collections of fruit were contested by four exhibitors, Mr. Kirk, Alloa, out-distancing others by his grand Grapes—Hamburgs of great size and bunch, and finely coloured; Madresfield Court very perfect in form, size of bunch and berry; and fine Buckland Sweetwater. Peaches, Melons, and Figs were very good in this collection of eight sorts. Mr. Smith, Oxenford Castle, had a capital 2nd, his Peaches, Nectarines, and Figs were first-rate. Mr. McIntyre, The Glen, was 3rd, with a fine lot. Some others competed well in this class.

First for four fine bunches of Grapes went to Mr. Murray, Park Hall, for large bunches of Black Hamburg, and Muscat of Alexandria. Mr. Kirk was 2nd, with capital Black Hamburg and Buckland Sweetwater, and Mr. Smith was 3rd. In this class there were many fine exhibits. For two bunches of white Grapes, a splendid pair of Duke of Buccleuch came from Mr. Rutherford, Airthrie Castle, Bridge of Allan. For "any other black" Mr. Kirk was 1st with a splendid pair of bunches. For two bunches of Black Hamburg Mr. Rutherford had 1st, with compact finely-finished bunches. Peaches were fine in size, though some were inferior in colour. Many of the exhibits were over-ripe; Cherries and

Strawberries were strongly represented in quantity, but there were few remarkable dishes among them. Melons were not numerous, but appeared to be good. Vegetables were good, especially Cauliflowers, Peas, Cabbages, Turnips, Carrots, and Potatoes. In the collection of twelve sorts were some fine Cucumbers, and Tomatoes. The best Tomatoes came from Mr. Jaffrey, gr., Ilarewood, Leeds.

Though this fine show was not so remarkable for bulk as some previous exhibitions, it was altogether remarkable for absence of inferior quality among the exhibits.

WOLVERHAMPTON FLOWER SHOW.

JULY 11, 12, 13.—Unsettled weather, with a thunder-storm on the first day, greeted this exhibition; still, there was a very large attendance on the second day, and an immense attendance on the third.

For sixteen stove and greenhouse plants, Mr. Cypher, Cheltenham, was 1st, and had in his lot very fine examples of *Ixora Pilgrimii*, a superb *Erica Parmentieri rosea*, *Kalosanthes coccinea*, in brilliant colour; a grand *Allamanda nobilis*, *Statice prolixa*, amongst the blooming plants; 2nd, Mr. Alderman Marriott, Coventry (gr., Mr. W. Finch), in whose collection were a monster *Ixora Williamsii*, an example of fine culture; a dwarf, beautifully-flowered *Allamanda grandiflora*, and a model *Erica impressa*, and two grand *Crotons*.

For six stove and greenhouse plants, 1st, Mr. Cypher, with *Stephanotis floribunda*, *Apelexis prolifera Barnesii*, *Allamanda nobilis*, *Erica Thompsonii* and *Parmentieri rosea*, *Ixora salicifolia*—a capital six; 2nd, Mr. Alderman Marriott, with *Dipladenia amabilis* in grand form; *Ixora Fraseri*, and the very distinct and fragrant *Allamanda Williamsii*, a variety evidently a hybrid, with a strong parentage of *A. nerifolia*, and profuse blooming; and two other plants.

Ornamental plants, Palms, and Ferns, were well shown.

In the class for eight Exotic Orchids, Mr. Cypher was the only exhibitor, and he had *Miltonia vexillaria*, *Cattleya Gaskelliana*, and *C. Sanderiana*; a very fine *Odontoglossum Harrisonianum*, *Epidendrum prismatocarpum*, *Odontoglossum Pescatorei*, *Cypripedium Curtisii*, and *C. Selligerum*.

Liberal prizes were offered for groups not to exceed 450 feet, and five very fine groups were staged: 1st, Mr. Cypher; 2nd, Mr. F. Denning, florist, Birmingham; 3rd, Mr. W. H. Dyer, Birmingham.

ROSES.

Several classes were devoted to these flowers, and there was a very good display, the northerners getting it all to themselves in the open classes, the southern growers being unable to compete. Messrs. Harkness & Sons, Bedale, were 1st respectively for seventy-two blooms, thirty-six and twenty-four blooms; and 2nd for forty-eight blooms. Messrs. Robt. Mack & Son, Catterick, were 2nd for seventy-two blooms and for twenty-four; and 1st for forty-eight blooms. Mr. H. Merryweather, Southwell, was 3rd for seventy-two and for forty-eight; and 2nd for thirty-six blooms. Messrs. D. & W. Croll, Dundee, was 4th for seventy-two, 1st for twelve light-coloured Roses, very superb blooms of *Etoiles de Lyon*; and 1st for twelve Teas.

In the amateur classes, Mr. Budd, Bath, and the Rev. Mr. Pemberton led, the former being 1st for thirty-six and twenty-four blooms, and for twelve Teas.

PANSIES.

Messrs. Dobbie & Co. easily won the 1st prize, with an extensive well set-up display; 2nd, Messrs. W. Paul & Co., Bridge of Weir; 3rd, Mr. Campbell, Blantyre, Silver Medals being awarded to the last-named. In Messrs. Dobbie's display were six new Violas, which received Certificates, viz, Miss Gibson, Prince of Orange, Duchess of Rutheasy, Lady Dufferin, Lillie Langtry, and Avondale. In addition, this firm had a very fine display of Sweet Peas, striped French and models in form of African Marigolds, Pelargoniums, Carnations, herbaceous blooms, &c., to which a handsome Silver Medal was awarded; 30 yards of tabling was required for this superb display.

In the gentleman gardeners' classes, open to the neighbouring counties, a good display was made. There was an excellent display of Gloxinias, some good stove and greenhouse plants. Six fine Orchids, which obtained the 1st prize, exhibited by Mr. J. Palmer, gr. to W. Bown, Esq., Birmingham, containing a wonderfully fine *bona fide* specimen *Epidendrum prismatocarpum*, with twenty-four fine spikes of

bloom; *Cattleya Sanderiana*, very fine; *C. Mendeli* and *C. Mossia*, *Epidendrum vitellinum majus*, and *Cypripedium Lawrenceanum*.

Some fine Fuchsias, Caladiums, and exotic Ferns, were staged, also two lots of good Begonias and one lot of six excellent pyramidal *Coleus* and medium-sized zonal Pelargoniums. In this section good prizes were also awarded for groups of plants not to exceed 400 square feet: Mr. Powell, gr. to G. H. Kenrick, Esq., Birmingham, was 1st; and Mr. Horton, gr. to W. Fowler, Esq., Sedgley, 2nd. Other flowers, fruits, and vegetables were competed for in this section.

AMATEURS.

Another division was set apart for amateurs who do not keep a gardener, and who reside within ten miles of Wolverhampton, and there was a spirited competition for groups and other plants, cut flowers, &c.

Another section was for cottagers only of the district, and the exhibits were so numerous and so good as to give the judges plenty of work. There were ten excellent exhibits of vegetables, ten exhibits of collections of herbs, seventy dishes of capital Peas, fifteen lots of three dishes of Potatoes, and other classes, well filled with good all-round exhibits.

FRUIT.

There was a fair display of fruit, some of which was of excellent quality. In the class for ten kinds, Mr. Gilman, Ingestre Hall, was 1st, with Foster's Seedling and Black Hamburg Grapes, both well coloured; Violette Hâtive and Royal George Peaches, and a fine Hero of Lockinge Melon. Mr. Bannerman, gr. to Lord Bagot, was 2nd; with two other exhibits.

For four bunches of Grapes.—1st, Mrs. Meakin, Stafford; 2nd, W. H. F. Hayhurst, Esq.

For two bunches of Black Grapes.—1st, Rev. Mr. Coventry; 2nd, Mr. W. H. F. Hayhurst.

Rev. Mr. Coventry was 1st for two bunches of white Grapes, Foster's Seedling. There were other classes for fruits.

VEGETABLES.

Messrs. Sutton & Sons and Messrs. Webb & Sons offered prizes for collections of vegetables, and those two champions, Mr. Waite and Mr. Wilkins, out-distanced all other exhibitors. Mr. Waite was 1st for Messrs. Webb's prizes, and 2nd for Messrs. Sutton's; and this position was reversed for Messrs. Sutton's prizes.

MISCELLANEOUS.

Two fair lots of twenty-four herbaceous blooms were staged in the open class, 1st, Messrs. Townsend; 2nd, Mr. G. Newell, Edgbaston, Birmingham.

In the three open classes for bouquets, Messrs. Perkins & Sons, had no competitors, as the excellent exhibits from this firm have a deterrent influence on many others.

There was a class for twenty-four varieties of hardy flowers most suitable for park decoration, given by the Chairman of the Parks Committee, but it brought out only one exhibit from Messrs. Townsend & Son, and that not of any particular merit, being chiefly annuals, some not of a very decorative character.

Mr. Paul Lutz, of Wolverhampton, gained a Gold Medal as a 1st prize for "the finest display of Pansies and Violas;" and three large exhibits were staged from Scotland.

Honorary exhibits were numerous, and several Medals were awarded, notably to Messrs. White & Son, Worcester; Messrs. Hewitt & Co., Birmingham; Messrs. Thomson & Co., Birmingham; Messrs. Birkenhead, Sale; Messrs. Edwards & Sons, Sherwood, Nottingham; Mr. W. P. Bason, Wolverhampton, for excellent Mushroom-spawn; Messrs. Richard Smith & Co., Worcester; Messrs. Wright & Holmes, for greenhouses; Messrs. Bayliss & Inman, for rustic-work, and other exhibits of garden requirements.

The arrangements were good, thanks to the energy of Messrs. Green & Son and Mr. Powell, who had the bulk of the work to do.

CHERTSEY, WALTON, AND WEYBRIDGE HORTICULTURAL.

JULY 13.—This exhibition was held in the pleasant grounds of Otlands Lodge, Weybridge, on the above date. Groups of plants arranged for effect were a distinct feature, in the larger class five competing, Mr. G. J. Cook, gr. to J. S. Sassoon, Esq., Ashley Park, Walton, won with a creditable arrangement. Mr. Hopkins, gr. to Mrs. Wodderspoon, Walton-on-

Thames, was the 1st prize-winner in the smaller class with a charming arrangement.

Foliage plants were best shown by Mr. Cool, and also exotic Ferns. Mr. Millican won for hardy Ferns.

In the class for a specimen flowering-plant, Mr. Hopkins staged a well-flowered *Bougainvillea glabra*, and won premier award.

Tuberous Begonias were very well shown, Mr. W. Steadman, gr. to Miss Verity, Moorcroft, Weybridge, winning easily.

Mr. T. Cheesman, gr. to W. Riddall, Esq., Ryden Road, Walton, was 1st for Fuschias.

Mr. E. Gardner, gr. to R. H. Turner, Esq., Ryden Road, Walton, won for zonal Pelargoniums, with freely-flowered specimens.

Gloxinias were well represented by the six plants that won premier award for Mr. Steadman.

Cut flowers made a bright display. Mr. Will Taylor, Osborn Nursery, Hampton, was 1st for twenty-four distinct varieties of Roses. Mr. Osman, Ottershaw Park, won for twelve trusses miscellaneous flowers. Mr. Pagram, gr. to A. Hobhouse, Esq., Byfleet Road, won for twelve varieties herbaceous flowers.

Fruit made an interesting display. Mr. Swann, gr. to Murray Smith, Esq., Brackley Lodge, Weybridge, secured 1st place for six dishes, for two bunches of black Grapes, and for two of white Grapes. In all classes the exhibits were good. This exhibitor also took premier award for a dish of Peaches, with extra fine Princess of Wales. Mr. Carpenter staged Lord Napier Nectarine in the single dish class.

Mr. Prothero, gr. to Miss Green, Oakwood, Weybridge, had the best Melon in a spirited competition. To Mr. Swann, for his two bunches of black Grapes, was awarded the Silver Medal given by the proprietors of the *Gardeners' Magazine*, for the exhibit which displayed the most cultural skill.

Messrs. J. Laing & Sons were very highly commended for a group of miscellaneous plants, not for competition; as also was Mr. G. Jackman, Woking, for eight dozen Rose blooms.

NATIONAL ROSE SOCIETY'S SHOW AT WORKSOP.

JULY 13.—The provincial show of the National Rose Society was held on the above date, in connection with the annual exhibition of the Worksop Rose and Horticultural Society. Great interest was, as usual, taken in the nurserymen's competition for the Jubilee Challenge Trophy, for which there were five entries. Messrs. Harkness & Sons, of Bedale, proved successful, and they also secured a Silver Medal. This makes the fifth time the firm has won the trophy. Their collection was a grand one, and conspicuous in it was a Horace Vernet and a Reynolds Hole. There was also an exceedingly well-grown specimen of Pierre Notting. Ireland provided the 2nd prize-winner in Messrs. Alex. Dickson & Sons, Newtownards, co. Down, and their specimens were rather more varied in colour than the victors. Prominent amongst them were Madame Hoste and Comtesse Nadailac.

In the seventy-two distinct, single trusses, Messrs. Harkness again took 1st honours, their best blooms being a Dr. Sewell, Duke of Connaught, and Suzanne-Marie Rodocanachi.

Messrs. Dickson & Sons were to the fore with thirty-six distinct, of three trusses each; and Mr. H. Merryweather of Southwell came out 1st in the thirty-six distinct single trusses; he had a fine sample of the Duc de Wellington. Messrs. Mack & Sons were successful in the eighteen distinct, with a splendid case, which included flowers of Victor Hugo, Rodocanachi, and Duc de Rohan, of very fine quality. Dr. S. Budd of Bath showed, among others, a fine Merveille de Lyon.

Mr. H. V. Machen of Gateford, Worksop, who was expected to make a grand show, had his chances somewhat spoiled by the heavy rain of the previous day, but he staged a remarkably nice lot.

The amateurs' trophy also went to Bedale, being secured for the first time by Mr. A. Whitton. There was a Comte de Raimbaud, which was perfect, and its equal has rarely been seen this season; and the Victor Hugo and Catherine Mermet were both lovely flowers. Mr. Hutchinson of Kirbymoorside took 2nd honours with a meritorious collection.

The remaining classes were only open to amateurs. The thirty-six, distinct, single trusses, was a very strong class. The Rev. S. H. Pemberton was 1st, and he also was awarded a piece of plate, given by the Duke of Portland; and a Silver Medal. The

latter was won by a Mrs. John Laing, which was undoubtedly the best Rose in the show.

There were some choice flowers in classes 6 and 7, and Mr. Machin, Mr. Hutchinson, Mr. Whitton, and Mr. W. Boyce of Derby, gained the coveted honours.

In Class 9, Miss Mellish, of Hodsock Priory, Worksop, had to take 2nd place to Mr. Grahame, of Croydon. Mr. Boyce was to the fore in another class, and Miss Mellish had again to take 2nd place. The competition was very close, however. Miss Jebb of Firbeck Hall, succeeded in capturing a winning ticket with a charming case. The same lady took premier honours for six Teas or Noisettes; Mr. A. Stewart, of Carlton, being placed 2nd; and Miss Mellish, 3rd. In the Tea and Noisette division some grand blooms were shown. Mr. Merryweather, Mr. J. Mount of Canterbury, Messrs. Dickson & Son, Dr. Badd, and Mr. Machen were the principal winners, and competition was keen in all the classes. Staged in this tent were the Roses of the exhibitors to the local show, and they proved a most meritorious lot; some of them were worthy of a place amongst the National exhibits. Messrs. Dickson, Brown, & Tait, of Manchester, had a stand of lovely blooms, not for competition.

With respect to the other part of the show, no fault could be found. There were monster vegetables, finely-grown plants, and a fine collection of fruits. In the latter division, the Duke of Portland, the Duke of Newcastle, Mr. E. J. S. Foljambe, and Mr. Frank Huntman were amongst the competitors, and, as might have been expected, the display was a finer one than has been seen in the district for some time. In the large groups arranged for effect, Mr. A. Webb, Kelham, Newark, came 1st, with a group full of colour; and the Duke of Portland was 2nd. Messrs. Fisher, Son & Sihray upheld their reputation by a charming display of plants, including some choice Orchids. Their exhibits were not for competition, and the same remark applies to the flowers and Tomatos sent by the Shireoaks Market Garden Company. *Sheffield Telegraph*.

PEOPLE'S PALACE, MILE END.

JULY 13.—It seemed quite appropriate to the general purposes of this institution that a flower show should be held in connection with it. The Governors are desirous of encouraging the growth of plants and flowers in the houses and gardens of the residents in this crowded district, and for this purpose they issued a schedule of prizes for plants, window boxes, Fern cases, cut flowers, Tomatos, and Cucumbers; two of the classes being devoted to exhibits by children. It was required that exhibitors be *bona fide* residents in the Tower Hamlets and Hackney divisions of the London School Board, and a very encouraging response for a first attempt resulted; small collections of plants, of a very credible character were shown, which must have been grown with great care, being so bright, clean, and on the whole well flowered. Among the subjects were Gloxinias, tuberous, and Rex Begonias, India-rubber plants, Tomatos in pots, Coleus, Ferns, Plumbago capensis, Fuschias, zonal Pelargoniums, Asters, Lilies, &c. *Bona fide* window plants consisted largely of Fuschias, some of them trained to large fan-shaped trellises, very finely grown and bloomed; the best plant in the show was one of these Fuschias, covering several feet each way, grown by George Haydon, a labourer, living in the Longfellow Road, Mile End, and which well deserved one of the Medals of the Royal Horticultural Society; for besides being covered with clean and healthy foliage, it had some thirty racemes of bloom. Some capital Ivies were shown in this class; and one poor woman, looking as if she was feeling the pinch of poverty, brought in a mass of Sedum acre growing in an old pie-dish, upon which plant she seemed to set great store. Many of the plants were awarded extra prizes, so generally good were they.

For once the large hall of the People's Palace held a most attractive flower show, for many groups of plants and cut flowers were sent for exhibition by ladies and gentlemen interested in the movement. In the centre of the hall was a fine collection of plants sent by Mr. Thomas from Frogmore by command of Her Majesty; and the Duke of Norfolk, Duke of Fife, Duchess of Wellington, Lady Rothschild, Lady Hothfield, Lady Henry Somerset, and many others, contributed, these exhibits being tastefully arranged round the sides of the spacious hall, and on tables down the centre, formed an exhibition of an extensive character. Among the trade contributors were Messrs. Cutbush & Son,

J. Cheal & Sons, Mrs. Holmes, Hackney; J. R. Chard, who delighted the East-enders with one of his charming arcadian designs for the table; Mr. Charles Turner, and others.

The Exhibition was opened at mid-day by Lady Rothschild, who expressed the hope that the proposal of the Governors to form a Horticultural Society in connection with the People's Palace would prove highly successful. The exhibition remained open from Thursday the 13th, to Saturday the 15th, and was largely attended.

TREES AND SHRUBS.

INDIGOFERA GERARDIANA.

LIKE pretty nearly everything else out-of-doors this season, *Indigofera Gerardiana* is flowering some weeks before its normal time. Whilst in ordinary years we look for the flowers in the months of July and August, they were this year appearing in the third week of June. This is a plant of singularly graceful growth; the shoots (which in the open ground are only of annual duration, being killed back to the stool each winter), are slender, 2 to 3 feet high, and clothed with delicately green, pinnate leaves. The flowers, which are papilionaceous, are arranged on erect spikes 6 inches long, and are of a pale rosy-purple; the plant continues in flower for some weeks. Although not much grown in private gardens, it is well worthy of extensive cultivation, being suitable for a front place in a border of shrubs, or even in a bed by itself; as a wall shrub also it is effective. It does not seed as a rule in this country, and is best propagated by cuttings. Lateral shoots should be taken in August with a slight heel of the older wood, and placed in a close shaded frame. If given a light sandy soil, they give no trouble to root, but there is sometimes a little difficulty in getting them sufficiently established and firm of wood to pass the winter. This year, however, will be exceptionally favourable to increase the stock, and cuttings will be obtainable some weeks in advance of the usual time. The early flowering may also allow for the proper ripening of the seed. The species is a native of Northern India. *W. J. B.*

MARKETS.

COVENT GARDEN, July 20.

HEAVY supplies this week, but soft fruit nearly finished. Hot-house goods quiet, with prices falling. *James Webber, Wholesale Apple Market.*

POTATOS.

Home-grown supplies have come in more freely, and last week's prices are fully maintained. Jersey and French prices declining. *J. B. Thomas.*

SEEDS.

LONDON: July 19.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., write that higher prices for Trifolium are quoted from France; the English demand for this article now increases every week. America cables advancing rates for Clover seed. Fabulously high figures are realised this season for Trefoil. The few choice spring Tares that are still obtainable meet a ready sale. New home-grown winter Vetches are now being marketed. This year's sowing Rye shows good quality, and can be bought on reasonable terms. There is a good consumptive inquiry for French Italian Rye-grass. In Rape seed the tendency is downwards. Mustard keeps firm. The Canary seed trade presents no new feature. Hemp seed is steady.

FRUITS AND VEGETABLES.

BOROUGH: July 18.—Quotations:—Peas, 2s. to 3s. 6d. per bushel; Cabbages, 4s. to 6s. per tally; Parsley, 2s. 6d. per dozen bunches; Onions, Egyptian, 4s. to 5s. per cwt.; Horseradish, 1s. 6d. to 2s. 6d. per bundle; Cherries, 4s. to 7s.; Gooseberries, 1s. 8d. to 3s. per half-sieve.

SPITALFIELDS: July 18.—Quotations:—Cabbages, 4s. to 6s. per tally; Peas, 2s. to 3s. 6d. per bushel; Onions, Egyptian, 4s. to 5s.; Turnips, 3s. to 4s. 6d. per cwt.; Horseradish, 1s. 6d. to 2s. 6d. per bundle; Cherries, 4s. to 7s.; Gooseberries, 1s. 6d. to 3s. per half-sieve.

STRATFORD: July 19.—There has been an excellent supply of all kinds of produce at this market during the past week, and a brisk trade was done at the undermentioned quotations:—Cabbages, 2s. to 4s. per tally; Greens, 9d. to 1s. 3d. per bag; Cauliflowers, 6d. to 9d. per dozen; 3s. to 5s. per tally; Turnips, 2s. to 2s. 6d. per dozen bunches; Carrots, household, 1s. 6d. to 2s. 6d.; Mangels, 3s. 6d. per ton; Onions, Egyptian, 80s. to 100s. per ton; do. Ports, 6s. 6d. to 7s. 6d. per case; do. Valencis, 6s. to 6s. 6d. per case; Apples, English, 2s. to 8s. per bushel; Cherries, 4s. to 8s. per half-sieve; Red Currants, 2s. to 2s. 6d. per half-sieve; Cucumbers, 1s. 6d. to 3s. per dozen.

FARRINGTON: July 20.—Quotations:—Cucumbers, 2s. 6d. per dozen; Tomatos, 6d. per lb.; Melons, 6s. to 8s. per case; Plums, 2s. 6d. to 3s. per basket; Red Currants, 3s. to 4s. per half-case; William Peas, 2s. per case; Peas, 2s. to 3s. 6d. per bushel; Parsley, 2s. 6d. per dozen bunches; Onions, Egyptian, 4s. to 5s. per cwt.; Cabbages, 4s. to 6s. per tally; Horseradish, 1s. 6d. to 2s. 6d. per bundle; Turnips, 3s. to 4s. per cwt.

POTATOS.

BOROUGH: July 18.—Quotations:—New: 5s. to 8s. per cwt.

SPITALFIELDS: July 18.—Quotations:—New: 5s. to 8s. per cwt.

FARRINGTON: June 20.—Quotations: New, 115s. to 148s. per ton; no quotation for old.

STRATFORD: July 19.—Quotations:—Old, 50s. to 70s. per ton; new, 100s. to 140s. do.; foreign, new, 70s. to 110s. do.

LONDON AVERAGES: July 19.—New: English, 5s. to 7s.; foreign, do., 5s. to 8s. per cwt.; old, nominal.

CORN.

Averages.—Official statement of the average prices of British corn, imperial measure (quarter) for the week ending July 15, and for the corresponding period in last year:—1893: Wheat, 26s. 3d.; Barley, 22s. 3d.; Oats, 22s. 3d. 1892: Wheat, 29s. 1d.; Barley, 22s. 4d.; Oats, 21s. 5d.

HAY.

Averages.—The following are the averages of the prices at the principal metropolitan markets during the past week:—Clover, prime, 135s. to 160s.; do., inferior, 105s. to 120s.; hay, best, 135s. to 160s.; do., inferior, 105s. to 120s.; and straw, 3s. to 50s. per load.

TRADE NOTICE.

MR. G. H. SMITH, for the past three years Head Gardener at Paul Cray Hill, has taken Nevill Court Gardens for market purposes. The establishment will in future be called Nevill Park Nursery, Tunbridge Wells.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—

- 0, Scotland, N. Principal Wheat-producing Districts—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S.
- Principal Grazing, &c., Districts—8, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; * Channel Islands.

THE PAST WEEK.

The following summary record of the weather for the week ending July 15, is furnished from the Meteorological Office:—

"The weather was exceedingly changeable and showery, with thunderstorms in nearly all parts of the kingdom, and with heavy falls of rain locally.

"The temperature was slightly above the mean in nearly all the grazing districts, as well as in 'Scotland, N.,' in other localities it was either equal to or a trifle below the normal. The highest readings were registered on the 9th, 10th, or 11th, when the thermometer exceeded 70° in most districts, and reached 77° in 'England, E.' The lowest readings occurred as a rule on the 15th, when the thermometer fell below 50° in all districts, excepting the Channel Islands, where the lowest reading was 56°. In the 'Midland Counties and England, S.W.,' the absolute minimum was as low as 44°.

"The rainfall amounted to less than the average in Scotland and the north-east of England, but in all other districts a considerable excess was shown. In the 'Midland Counties' the total fall was twice as much, and in 'England, S. and S.W.,' more than twice as much as the normal, the excess in the two last mentioned districts being due to a heavy fall, which occurred on the 15th or early on the 16th. In Eastbourne and its immediate vicinity, the amount of rain which fell between 7 A.M. and 1 P.M. on the 16th, varied between 2 and 3 inches; the heaviest fall in a short period being at the rate of about 2 inches per hour.

"The bright sunshine was less than the average in all districts, excepting the Channel Islands; the deficiencies being in many localities very considerable. The percentage of the possible duration averaged from 11 in 'Scotland, N.,' and 13 in 'Scotland, E.,' to 33 in 'England, S.,' 33 in 'England, S.W.,' and to as much as 49 in the 'Channel Islands.'"

APPLES AND BORDEAUX MIXTURE: *Munches.* It may be used now, at fortnightly intervals, on all but early varieties. A consumer would have to eat several bushels of fruit at a time, and these with the rind on them, before he would show the least symptom of poisoning! It is quite safe, if the most ordinary caution be employed.

APPLE FROM THE CAPE: *Professor McO.* So far as we are able to judge, it is Warner's King, a little glorified as regards colour.

CORRECTION.—National Carnation Society's Show, Chiswick, Mr. A. Greenfield, Sutton, Surrey, desires to say that it was he who was 1st for six flake Carnations, and not Mr. J. Douglas, as stated in our report.

CREEPERS FOR A FENCE SURROUNDING A MUCH EXPOSED LAKE IN GARDEN: *Desideratum.* To mask the fence only, plant *Periploca graeca*, *Bignonia radicans*, *B. capreolata*, *Clematis Jackmani* in variety, *Lonicera Caprifolium* (Honeysuckle), *L. sempervirens*, *L. Periclymenum* in variety, *Jasminum officinale*, *Lathyrus grandiflorus*, *Rosa arvensis*, *R. scandens* (Ayrshire), *R. Bourcaultii*, *R. moschata*, *R. Félicité-Perpétue*, *Vitis Labrusca*, *V. rotundifolia*, and *Wistaria sinensis*. To hide the fence in greenery, plant any of the large-leaved Ivies, as the Irish, Algerian, Regner's, &c.; *Aristolochia Siphon*, this is bare in winter; *Cotoneaster microphylla*, *Lonicera flexuosa*, and *Euonymus japonicus* in variety, these last being trained loosely to the ironwork. The plants cannot be planted in the gravel walk, but a good border, so arranged that it will be well drained of the water that falls on it, must be made, and at a rather higher level than the water in the lake. The plants will not succeed in a water-logged soil. Having made the border, and allowed the mould to consolidate, there would be no harm in covering it with gravel, &c., and forming a walk, but a space of 1½ to 2 feet in width should be reserved for the plants, at least for a few years.

CUCUMBER DISEASE: *T. W. and T. Kibble.* Next week.

CUCUMBERS: *A. H.* On the Cucumber leaves I find nothing. In the stems and roots no fungus mycelium. There is no trace of the symptoms of bacterial disease. About the roots are a number of minute hyaline nematode worms. At least, they seem to be so to me, but there are none of the galls, as far as I can see, which are formed on roots by irritation. I do not detect any galls on the root-fibrils. *M. C. Cooke.*

ELLAN'S EARLY CABBAGE: *W. Robinson.* Sow in the first week of August and a fortnight later, for South and Mid-England, and in the North and Scotland, a week sooner.

ERANTHEMUMS WITH FUNGUS: *Ignorant.* Please send more specimens.

GARDENING IN CANADA: *G. S.* With your knowledge of the business, you need have no hesitation in going to Canada, where, if the climate is different to that of this country, it is very healthy, and the prospects for a young, steady, and healthy man are very good. With regard to several matters about which you ought to know something before you start, and which we cannot touch upon in this column, you had better make enquiries at the Emigrants' Information Office, 31, Broadway, Westminster, S.W. One of the best Canadian horticultural journals is the *Canadian Horticulturist*, published at Ottawa.

MARKET PRICES OF FRUIT AND VEGETABLES AT NEW YORK: *J. D. S. D.* None of the American periodicals that reach us contain a list of market prices of fruit and vegetables at New York.

MUMMY PEA: *M. C.* A well-known fasciated form of the common Pea. The mummy story is all nonsense.

NAMES OF PLANTS: *W. F.* *Kolreuteria paniculata*. — *Bruc.* 1, *Cupressus* (*Retinospora*) *obtusata*, golden variegated; 2, *Tsuga Pattoniana*; 3, *Cupressus* (*Retinospora*) *lycopodioides*; 4, *Abies nobilis*; 5, *Ilex microphylla*; 6, *Calystegia*

pubescens.—*T. C. I.*, *Trachelium cœruleum*; 2, *Lysimachia thyrsoflora*.—*Fern. a.*, *Nephridium montanum* (*Lastrea*); *b.*, *Polypodium Phegopteris*; *c.*, *Aspidium* (*Polystichum*) *aculeatum*; *d.*, *Aspidium rigidum* (*Lastrea rigida*); *e.*, *Athyrium filix-fœmina*; *f.*, *Thuya dolabrata*.—*E. M. C.*, *Kingstown*. *Dendrobium Pierardi* and *D. ciliatum* (the lesser).—*G. G.*, *South Wales*. 1, *Pyrus Aria*; 2, *Bignonia Cherere*; 3, *Campanula pusilla alba*; 4, *Cypripedium caricinum*; 5, *Cypripedium Parishii*; 6, *Cotoneaster Fontainesii*, probably.—*H. E.* *Cattleya Forbesii*.—*Clover Seed*. 1, *Scabiosa arvensis*; 2, *Ononia arvensis*.—*E. C. L.* 1, *Alnus glutinosa Jaciniata*; 2, a variety of the same species. We believe it to be the form known as *imperialis*, but the specimen is small.—*W. M. J.* 1, *Juncus obtusiflorus*; 2, *Carex ampullacea*; 3, *C. paniculata*; 4, *Polemonium cœruleum*; 5, *Antennaria margaritacea*; 6, *Kerria japonica*.—*J. Cooper*. *Prunus myrobalana*.—*Henderson & Son*. *Melilotus officinalis*, not native of your district.

NECTARINES: *Knowle Green*. The fruits have been attacked by the Peach mildew—*Glæosporium læticolor*—now dead, which caused the skin to lose its power of expanding as the fruit grew in size, hence the skin cracked, exposing the pulp, thereby inducing decay. We do not think you can do anything this year, but you could use the Bordeaux Mixture next year.

NITRATE OF SODA: *J. A.* We do not know when this substance was first used in agriculture.

NOTICE TO QUIT SERVICE: *W. S.* In the absence of an agreement, a month's notice on either side is the legal time, unless the servant should have been guilty of gross misconduct.

ROSES: *J. B.* Nothing definite is known as to the Roses of ancient Greece, and nothing whatever of Roses before that period.

THE SEASONS AT KIMBEBLEY, SOUTH AFRICA: *Kimberley*. The cool, or winter season, extends over May, June, July, and August. In June the mean temperature is about 52°8', Fahr., and from that month onwards to January there is a gradual rise to 70°5', Fahr., the warmest month.

TOMATO FUNGUS: *W. C. & Sons, G. P., and others*. The various fungi affecting the Tomato are very prevalent this season. Bordeaux Mixture, properly used, would have kept them in check.

TRAPA DICORNIS: *W. H.* Place the seeds in water at a temperature of 65°. We do not know of any "bulbous" plant called the "Umbrella plant."

VINE DISEASE: *J. S.* Yes; it is the same as described by Mr. Blackmore. At present little is known about it.

LARGELY INCREASED CIRCULATION of the "GARDENERS' CHRONICLE."
IMPORTANT TO ADVERTISERS.—The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper, increased to the extent of 75 per cent.
 Advertisers are also reminded that the "Chronicle" circulates among country gentlemen, and ALL CLASSES of GARDENERS and GARDEN-LOVERS at home, that it has a specially large FOREIGN and COLONIAL CIRCULATION, and is preserved for reference in all the principal Libraries.

GARDENERS AND OTHERS WANTING SITUATIONS.

26 words, including name and address, 1s. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.

Births, Deaths, and Marriages, 5s. each insertion.

NOTICE TO ADVERTISERS.—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all.

Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

POSITION.—Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at No. 42, DRURY LANE, to A. G. MARTIN, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.

Advertisements for the current week MUST reach the Office not later than Thursday noon.

All Advertisements should be addressed to the PUBLISHER.

Publishing Office and Office for Advertisements, 41, WELLINGTON STREET, STRAND, W.C.

SUBSCRIPTIONS.

All Subscriptions payable in advance. The United Kingdom, 12 months, 15s.; 6 months, 7s. 6d.; 3 months, 3s. 9d. All Foreign Subscriptions, including Postage, 17s. 6d. for 12 months. Post-office Orders to be made payable at the Post-office, 42, Drury Lane, W.C., to A. G. MARTIN.

Subscribers who experience any difficulty in obtaining their copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint).

HILL & SMITH'S BLACK VARNISH

for Preserving Ironwork, Wood, or Stone.

(Registered Trade Mark.)

An excellent substitute for oil paint, at one-third the cost. Used in all the London Parks, at Windsor, and Kew Gardens, and on every important estate in the Kingdom. Has stood the test of forty years' trial. Requires no mixing; can be applied cold by any ordinary labourer. Price 1s. 6d. per gallon at the manufactory, or carriage paid to any railway station, 1s. 8d. per gal. in casks of 36, 18, or 9 gals.

CAUTION.—Every Cask bears the above Registered Trade Mark. Beware of cheap imitations.

HILL & SMITH,

WANT PLACES.

TO GARDENERS AND OTHERS SEEKING SITUATIONS.

Advertisers are cautioned against having letters addressed to initials at Post-offices, as all letters so addressed are opened by the authorities and returned to the sender.

The pressure upon our space at this season of the year is so great, we are compelled to state that advertisements received after 6 P.M. on Wednesday will, in all probability, be held over to the next week.

Gardeners, Farm-Bailiffs, Foresters, &c.

DICKSONS, Royal Nurseries, Chester, are always in a position to RECOMMEND MEN of the highest respectability, and thoroughly practical at their business. All particulars on application. Telegraphic and Postal Address—"DICKSONS, CHESTER."

FOREMAN PROPAGATOR or GROWER.—Age 33; married; well up in Grapes, Tomatos, Cucumbers, Mushrooms, Strawberries, and the general pot and cut market stuff. Good experience in putting up new glass and hot water; disengaged when suited; lifetime experience in the trade; good character.—F. ARCHER, 99, Gibson Buildings, Stoke Newington.

FOREMAN and PROPAGATOR.—Twenty-five years' practical experience in the Cultivation of Plants and Cut Flowers, Wreaths, &c. Good Salesman.—G. PESTRIDGE, 5, Beale Street, Lower Edmonton.

FOREMAN (WORKING).—Understands Growing Roses, Fruit Trees, and General Nursery Stuff. Good Budder and Grafter. Six years' good character.—BAKER, Stanmore Gardens, Stanmore, Middlesex.

FOREMAN (INSIDE).—Age 27; ten years' experience in Plant and Fruit-houses. Good references.—GEO. THOMPSON, Park Gatehouse, Westwell, Ashford, Kent.

FOREMAN or PROPAGATOR.—Age 28; well up in all Market Plants, Palms, Ferns, and Cut Flowers, Grapes, Tomatos, Cucumbers, Forcing Balbs, &c.—S., *Gardeners' Chronicle* Office, 41, Wellington St., Strand, W.C.

FOREMAN, or JOURNEYMAN (FIRST), in a good establishment.—Age 25; excellent references.—J. FRANCIS, Church Street, Madeley, near Salop.

FOREMAN, in a good establishment.—Age 28; English. Practical experience in all branches. Mr. F. BRIDGEMAN recommends his late Foreman, Alfred Wood, as above, to anyone requiring a thorough good man.—Straffan House Gardens, Straffan Station, co. Kildare, Ireland.

JOURNEYMAN (FIRST), in a good private Establishment.—Age 24. Six years' practical experience in three places, and four years previous in good gardens.—H. BILLS, Hartwell Garden, Hartfield, Sussex.

JOURNEYMAN, in the Houses.—A young man (age 21), seeks a situation as above. Six years' experience: both Inside and Out, with good character.—JOURNEYMAN, Mr. Watt, Beckton, Fordingbridge, Hants.

JOURNEYMAN, Inside, or Inside and Out.—Age 20; three years in last situation. Good character. Bothy or otherwise.—W. AWKFR, 41, Mayfield Terrace, Harrogate, Yorks.

JOURNEYMAN, in a good establishment.—Age 13; eight years' thorough good practical experience. First-class references.—H. S., Kingswood Gardens, Englefield Green, Egham, Surrey.

JOURNEYMAN (INSIDE); age 22.—Mr. SELDEN, Gardener to Sir Guy Campbell, Bart., Coombe Cottage, Kingston-on-Thames, wishes to recommend C. Goodchild, who has been with him nearly two and a half years Inside. Bothy preferred.

JOURNEYMAN, in the Houses.—Age 21; four years' experience. Good character.—H. BATES, The Gardens, Bevingbrough Hall, York.

JOURNEYMAN, or GARDENER (UNDER), Inside, or Inside and Out.—Age 19; four years' experience. Four years' good character.—G. HENLEY, Sayers Common, Haslocks, Sussex.

JOURNEYMAN.—Age 20; three years in last place. First-class references and good character. Bothy not objected to.—BROWN, Brooklyn Villa, Mercland Road, New Eltham, Kent.

JOURNEYMAN, Inside or Inside and Out.—Age 21; good experience. Highly recommended.—A., Mrs. Lee, Ashwell, Ilminster, Somerset.

JOURNEYMAN (FIRST).—Age 23; eight years' experience in first-class Gardens. Well recommended.—C. S., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

KNIFEMAN (Experienced), wants employment. Twelve years' experience. Good references. Would take Budding by contract or otherwise.—F. S., 3, Brunswick Road, West Worthing, Sussex.

IMPROVER.—Situation wanted for a well-educated Youth, age 17. Good references. Bothy preferred.—KINGHAM, The Firs, Woolford Green, E.

IMPROVER.—Situation wanted in a Gentleman's Garden as above. Age 17; three years' experience Inside and Out.—H. STACY, The Gardens, Mongewell, Wallingford, Berks.

IMPROVER.—By a Youth, age 16; three years' experience, In and Outdoors. Can be highly recommended. Bothy preferred.—J. SIMMONS, Hampton Lodge, Stourton, Stourbridge.

TO GARDENERS.—Mr. LYDDIARD, Head Gardener, Kidbrooke Lodge, Blackheath, will be pleased to recommend a man for Kitchen Garden or Pleasure Grounds. Age 29, married.

TO GARDENERS.—Situation wanted by a young man (age 20) in a Gentleman's Garden, Inside or Out. Good character.—A. BOOKER, The Gardens, Coombe Cottage, Kingston-on-Thames.

TO GARDENERS.—Mr. SELDEN, Gardener to Sir Guy Campbell, Bart., wishes to recommend J. Shore to any Gardener requiring the services of a young man (age 21) for General Outside Work. Bothy preferred.

TO GARDENERS, &c.—Lad, nearly 17, strong and willing, desires a situation in a Garden or Nursery, Inside or Out. No experience.—E. A., Mr. Staines, Ringwood, near Dover.

TO GARDENERS, &c.—Situation wanted, by a Lad, age 18, to Assist in the Houses, in a Nursery, or Gentleman's Garden. Two and a half years' reference.—T. ELCOME, 12, New Street, Three Bridges, Sussex.

TO GARDENERS.—Wanted, by a young man, in his 19th year, a situation in a Gentleman's Garden. Good knowledge of Lawn and Kitchen Garden. Bothy, or otherwise. Four years' experience.—H. MOLES, Stanbury, Reading.

TO GARDENERS.—A young man (age 24) seeks a situation in the Garden; ten years' experience, Inside and Out. Good character.—J. TULK, Norton-sub-Harden, near Ilminster, Somerset.

TO NURSERYMEN, &c.—Situation wanted. —Age 23. Experience in Grapes, Strawberries, Tomatos, Roses, Carnations, Chrysanthemums, and General Cut Flowers, Bedding Plants, &c., Market or Retail.—W., 12, Sunningdale Cottages, Lower Edmonton.

TO NURSERYMEN and OTHERS.—Situation wanted by a young man (age 28). Used to Vines, Roses, &c. Twelve years' good reference.—H. BRIDGES, Powick, Worcester.

TO NURSERYMEN.—Situation wanted in a Market Nursery (age 23). Used to the Trade.—State wages, &c., to E. B., 53, Taunton Road, Lee, S.E.

TO NURSERYMEN.—Wanted, a situation in Market Nursery, used to Ferns, Roses, Carnations, Bouvardias, Cucumbers, Tomatos, and the general routine of the Trade.—S. H., 45, St. James Street, Brighton.

TO SEED MERCHANTS, NURSERYMEN, &c.—Advertiser is open to represent a first-class Firm in the West Midland Counties, to attend Markets and Stock Sales, where he has a valuable Connection, and Life Experience in the Business. Highest references. Terms, Salary, Commission, and some Expenses.—GEORGE FISHER, Mile End Terrace, Bromyard Road, Worcester.

COWMAN, or ODD MAN.—Age 29, single; willing to assist in Garden, and be useful.—HARRIS DUFFIN, Totteridge House, Totteridge, Herts.

CLERK (NURSERY TRADE).—Can be well recommended by present employers.—For particulars, address J. H. J., Dicksons Nurseries, Chester.

COLLECTOR of RENTS in the Country.—Age 33 years; fourteen years' character. Highest references; security if necessary.—X. O., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

TO FLORISTS or OTHERS.—Advertiser seeks Situat on in a Florist's Nursery or Private Place, understands Growing R eses, Carnations, Pelargoniums, Fern and other Flowers for Market or Private purposes. State Wages.—KIMPTON, Clonawin, Elwens Road, Richmond, Surrey.

THE MESSAGE OF PEACE is always appreciated and respected by all true men, for many of us hope that the time is not far distant when it may be universally adopted by all nations. When this comes to pass, happiness and prosperity will be the rule and not the exception. In the meantime Holloway's Pills and Ointment have largely helped to make Foreign nations understand that Englishmen delight in alleviating pain and suffering. These wonderful remedies have been blessed in many lands, for the relief they have afforded and the cures performed. They are especially adapted for all complaints affecting the liver, stomach, and kidneys, and at this season no family should be without a supply.

MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY NEXT, August 3, at half-past 12 o'clock precisely, a COLLECTION OF ORCHIDS in FLOWER and BUD, including some choice specimens and varieties. IMPORTED ORCHIDS, and a Collection of ESTABLISHED DITTO, in fine health. Also 10,000 PALM SEEDS, 5000 Romap HYACINTHS, 20,000 FREESIAS, a small Collection of FERNS, &c.

On view morning of Sale, and Catalogues had.

Thursday Next.

A valuable Consignment of PALMS from BELGIUM.

MR. J. C. STEVENS will include in his SALE by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY NEXT, August 3, a valuable Consignment of PALMS and other STOVE and GREENHOUSE PLANTS from Belgium, without reserve.

On view morning of Sale, and Catalogues had.

Friday, August 4, 1893.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY NEXT, August 4, at half-past 12 o'clock, by order of Mr. F. SANDER, St. Albans, a magnificent importation, guaranteed true of—

CATTELEYA REX, J. O'BRIEN.

Mr. JAMES O'BRIEN says this grand new species is THE KING OF THE CATTELEYS.

AWARDED TWO FIRST-CLASS CERTIFICATES BY THE R.H.S.

Mr. J. O'BRIEN says:—"Taking the flower at a glance, the nearest thing I can liken it to is the Cattleya Imshooiana, for which Baron Schroder received a First-class Certificate at the Royal Horticultural Society, but this is different, and superior in every respect."

The Gardener's Chronicle, February 28, 1891, says:—"Six flowers on one inflorescence were noted, and there is little reason to doubt that under cultivation this Orchid will develop in beauty, and take rank among the very finest of the genus." Many plants will be offered with seven to ten old flower-stems showing on a spike.

THE FINEST IMPORTATION YET BROUGHT TO EUROPE.

CATTELEYA REX.

THE NON PLUS ULTRA OF THE GENUS.

Grand plants and magnificent masses in simply perfect condition.

The type of our importation may be imagined by the fact that we are able to show on the day of Sale gigantic masses with flower-spikes equal in size to Cattleya gigas Sanderiana, and showing as many as nine and ten flower-stems on a spike, this being quite unprecedented in the history of this Cattleya.

EULOPHIELLA ELISABETILE.

An exquisitely beautiful New Orchid from Madagascar, for which a new genus has been created.

Mr. R. A. ROUPE, of Kew Gardens, the author of the genus, has examined our plants, and certified them true.

The Gardener's Chronicle says:—"It was decidedly one of the most remarkable Orchids—if not the most remarkable plant—in the last (8th) International Exhibition."

Mr. WATSON, in the American Garden and Forest, says:—"This is a plant of extraordinary interest and beauty, with white flowers, a yellow lip, and rich crimson-purple sepals."

The Gardener's Chronicle says:—"The flowers are as large as those of Odontoglossum crotocum, white, with the outer surface purplish-red; callus of the lip orange-yellow."

The plant then exhibited came from Mr. HANDELIN.

EULOPHIELLA ELISABETILE

is a Madagascar plant, and all and every plant now in Europe were collected by Mr. Handel. Vide M. SALLERIN'S letter, in Gardening World.

150 SELENDID GROWING PLANTS WILL BE OFFERED.

CATTELEYA GIGAS—SECTION OF SANDER.

Strong and Healthy Established Plants, all Unflowered.

These plants are from the same importation that produced C. gigas Sander, C. gigas Hamar Ross variety, which one of our highest Orchid authorities declares to be the richest-coloured of all Cattleyas; C. gigas Rothschildiana, and a wonderful white one, just flowered by the Duke de Massa.

OLD AUTUMN-FLOWERING CATTELEYA LABIATA.

from which has flowered labiata alba, Le Doux's variety, Hardy's variety, Sandera, and numerous other grand forms.

The New CYMBIDIUM SARGENTII.

NICHOLSONIANUM.

MASSALIANUM.

CYMBIDIUM HUMBOLOTHI. C. CYPEREFOLIUM.

PHAIUS AMABILIS. P. SANDERIANUS.

DENDROBIUM COORSII. D. NOBLE SANDERIANUM.

MESSRS. PROTHEROE AND MORRIS will include in their GREAT ORCHID SALE, which will be held in their Rooms, 67 and 68, Cheapside, E.C., on FRIDAY, the 4th of August next, at half-past 12 o'clock precisely, two young so-called

TREE LIONS.

from Madagascar, these animals are of great interest and much has been written about them.

Langley, near Slough.

About 1 mile from Langley Station.

CLEARANCE SALE OF PLANTS, many of which have been successfully exhibited, by order of K. W. Mann, Esq., who has let the Residence.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, on the Premises, Langley Broom, Langley, near Slough, on WEDNESDAY, August 9, at one o'clock, without Reserve, the whole of the well-grown STOVE and GREENHOUSE PLANTS, including trained specimen Pelargoniums, show varieties, and fine plants of Cyclamen persicum, which have been exhibited at the Crystal Palace and Rotting Gardens, and have taken many prizes; choice Ferns, including specimen Davallias, Gymnogrammas, and Microlepias; Crotons, and Orchids, Palms, Arum Lilies, and many others.

On view day prior and morning of Sale. Catalogues may be had of Mr. Phillips, Head Gardener, on the Premises, and of the Auctioneers, 67 and 68, Cheapside, London, E.C.

North Finchley, N.

Adjoining the main North Road, and about five minutes' walk from Woodside Park Station.

IMPORTANT UNRESERVED SALE OF PLANTS, Three Horses, Two Market Vans, &c.

MESSRS. PROTHEROE AND MORRIS are instructed by Mrs. Weatherill to SELL by AUCTION, on the Premises, the Woodside Nursery, North Finchley, N., on TUESDAY, August 1, at 12 o'clock precisely, in consequence of the large number of lots, entirely without reserve, 6000 CALLAS, strong plants; 1900 GENISTA FRAGRANS, cut back; 500 PELARGONIUMS MADAME KOENIG, the best white; 1500 PELARGONIUMS, in variety; 2500 TEA ROSES in pots, many of them extra fine; 300 ROSES GENERAL JACQUEMINOT, 1000 FAIRY ROSES, 900 CHRYSANTHEMUMS, best market sorts; 500 IVY-LEAF GERANIUMS, 4000 LILIUM CANDIDUM in pots, 500 LILIUM SPECIOSUM ALBUM, 5700 MAIDENHAIR FERNS, 300 ASPIDISTRAS, 250 large CAMELLIAS and AZALEAS, including twenty-five specimen AZALEA INDICA ALBA, 4 feet by 4 feet, and thirty others, 4 feet by 3 feet, and large plants in 16 and 24-pots. PEAT, STAKES, WATER-TUBS, BARROWS, and FLOWER-POTS. Also, Two capital four-wheel Spring Market VANS, two Tumbril CARTS, small VAN, well bred MARE and FOAL, one bay COLT, and one black HORSE.

May be viewed three days prior to the Sale. Catalogues can be obtained on the Premises, and of the Auctioneers, Estate Agents, and Valuers, 67 & 68, Cheapside, London, E.C.

Hastings.

IMPORTANT TO EXHIBITORS AND FURNISHERS. CLEARANCE SALE OF SPECIMEN EXHIBITION PLANTS, remarkably well-grown and in the best possible condition for the forthcoming Flower Shows.

MESSRS. PROTHEROE AND MORRIS are instructed by Mr. E. C. Gillett to SELL by AUCTION on the premises, Springfield Nursery, Hastings, on WEDNESDAY, August 2, at 1 o'clock punctually, the whole of his choice and well-grown EXHIBITION SPECIMEN PLANTS, including noble examples of Kentias, Chamrops, Brahyia, Crotons of sorts symmetrically formed and of the brightest colours, noble Tree Ferns, Dicksonias, Alsophilla australis, Microlepis exaltata, Pteris munita, Adiantums of sorts, a beautiful specimen of Gymnogramma Wettenthaliana, Exhibition Flowering Plants, amongst which may be mentioned Allamanda grandiflora, &c., Dipladenas of sorts, Vallota purpurea, Stephanotis, Rondeletia, grand plants of Lappageria alba and rosea, Stactis Gilbertii, Autumn-flowering Ericas of sorts, &c.

May be viewed any day prior to the sale. Catalogues had on the premises and of the Auctioneers, 67 & 68, Cheapside, London, E.C. N.B.—Cheap trains run from London every day.

Elm, Cambridgeshire.

VALUABLE ORCHARD LAND FOR SALE.

MESSRS. MAXEY AND SON have received instructions to SELL by AUCTION at the "White Hart" Hotel, in Wisbech, on THURSDAY, August 3, at 7 o'clock in the evening precisely, a very valuable ORCHARD and FRUIT GARDEN, situate in the village of Elm, about 2 miles from the Market Town of Wisbech, and in the midst of one of the finest fruit-growing districts in that neighbourhood. The property comprises in all 25 a. or 36 p. of extremely valuable land (the soil being of the richest quality, and especially adapted for the cultivation of Strawberries), together with a commodious brick and thatched Farmhouse, with large Barn, Granary, Stables, and other outbuildings.

Possession will be given at Michaelmas next. Particulars, Plans, and Conditions of Sale can be obtained on application to the Auctioneers, South Brink Place, Wisbech; or to BOTSFOED AND KING, Solicitors, 10, Market Street, Wisbech.

WANTED, a SMALL NURSERY, with Dwelling-House, suitable for local Jobbing Trade. A. M., 35, TOLLINGTON PARK, N.

ADVERTISER seeks opening in Market Nursery, where he could INVEST £100 to £150 in a genuine concern. Thoroughly experienced. Highest references. Full particulars to M. C. Gardener's Chronicle Office, 41, Wellington Street, Strand, W.C.

SOUTH COAST.—Situate in the best position of an important seaside resort. TO BE SOLD, a bargain, a first-class FLORIST'S BUSINESS, with a turnover of over £8000 per annum. Price for the whole as a going concern, £1500, but a reasonable offer would not be refused. Held on lease at £170 a year, £15 of which is left off.

Full particulars of PROTHEROE AND MORRIS, Auctioneers, 67 and 68, Cheapside, E.C. Fg to 8046.

To Nurserymen, Investors, and Others.

FOR SALE, by Private Treaty, the Stock, Greenhouses, Pits, &c., together with the Goodwill of a NURSERY BUSINESS, established more than half a century, situated about a mile from a thriving town in the Midlands. The Nurseries are about 23 acres in extent, and are well stocked. There are also 8 Greenhouses, Forcing Pits, Sheds and Offices, including an excellent and ornate Residence, Long Lease, &c. The whole presents an opportunity rarely met with in the Nursery Business. For particulars apply by letter, to Messrs. C. J. Corkran & Co., 133A, King's Road, Chelsea, S.W.

FOR SALE, a FREEHOLD NURSERY, situated in the west end of one of the most fashionable seaside resorts in England (South Coast), containing 5 Houses, well heated and modern built. Incoming for Freehold, &c., £1500. Address for particulars to THOMAS, Gardener's Chronicle Office, 41, Wellington Street, Strand, W.C.

TO BE SOLD, a FREEHOLD MARKET NURSERY, 420 feet of Glass-houses, and about 70 feet Frames, all heated, standing in two Acres of land, and capable of great extension. Near station for London or the North. S. W. DANBY, Leagrave, near Luton, Beds.

FOR SALE, a good and extensive SEED BUSINESS (Farm, Vegetable, and Flower). Returns, £5000 per annum, with good profits. Satisfactory reasons for selling.—Apply to B. Messrs. Hurst & Son, 152, Houndsditch London, E.C.

GENUINE Old-established FLORIST'S BUSINESS FOR SALE, main thoroughfare, good connection, good six-roomed House, Stable, &c., seven Greenhouses, excellent stock of Plants suitable for Cut Flower Trade, growing crops of Grapes and Tomatoes. Having taken another concern, would sell cheap.—WILSON, 149, Markhouse Road, Walthamstow, E.

OLD ESTABLISHED FLORIST BUSINESS for immediate disposal, No reasonable offer refused.—A. K., Gardener's Chronicle Office, 41, Wellington Street, Strand, W.C.

FOR SALE, a NURSERY and JOBBING BUSINESS; 800 feet of Glass, well-stocked Cottage, and Stabling. All Home Trade. Established 20 years. All at £300, or offer.—S., 122, Mulham Road, Forest Hill, S.E.

FOR SALE, long LEASE, over 30 years, NURSERY and JOBBING BUSINESS, 4 Greenhouses (heated) and Pits; 2 Cottages, 70 feet frontage by 250 feet deep. Well stocked.—Apply J. H., Park Nursery, Kaling, Middlesex.

FOR DISPOSAL, Genuine Old-established SEED BUSINESS, situate in main thoroughfare of one of the best Market Towns in the Midlands. Present Turnover about £300. Splendid opportunity for young Man starting Business. Total incoming from £150 to £200. No Book Debts to take to Satisfactory reasons for Disposal.—S. S., Gardener's Chronicle Office, 41, Wellington Street, Strand, W.C.

LARGE GARDEN, South of England, 16 acres, two Cottages, twenty large Green and Vine Houses, and Heated. Low rent.—ELDRIDGE, Portland Club, Southsea.

Tottenham.—To Nurserymen and Florists.

TO BE LET, a NURSERY, consisting of four Greenhouses, three Heated by Hot-water, capital House, containing eight rooms and domestic offices. Rent £25. Particulars of Mr. ALFRED RICHARDS, Estate Agent, 816, High Road, Tottenham. (1144).

City of Peterborough.

TO NURSERYMEN, FLORISTS, SEEDSMEN, and OTHERS.

TO BE LET, with Immediate or Michaelmas Possession, the well-known, old-established Peterborough BUSINESS, comprising a NURSERY FARM of 25 acres, of which 13 acres are under cultivation, not heavily stocked; the remainder in Pasture Land, with good House and Premises, Greenhouse, Pits, &c., adjoining the town. Also, a superior SEED SHOP and STORE, in a first class central position; and a FLOWER-STAND on the Great Northern Railway Station. The whole Business has for many years been carried on by Mr. John House, who is retiring on account of declining health, and leaving a fine opportunity for an enterprising trader.

Apply, FOX AND VERGETTE, Estate Agents, Peterborough.

FOR SALE, cheap, one No. 2 Patent, 9 ft. 6 in. HORIZONTAL BOILER (reference to the Thames Bank Iron Co.), with Fittings complete. Brand new last December, never used and quite perfect.

Full particulars given, and offers requested to ENOCH WHITE AND SONS, Nurserymen, Bourne-mouth.

MESSENGER & CO'S New CATALOGUE of Greenhouses and Heating Apparatus.
 Just issued, will be found the most complete, practical, and reliable guide to all about to build, alter or heat Greenhouses. Illustrations of every description of Glasshouse, from the largest range of Winter Gardens to the simplest forms of Portable Greenhouses, Plant Protectors, and Garden Frames; also of all the best kind of Boilers, Hot-water Pipes, and all appliances for heating. This Catalogue, possessing hundreds of illustrations of all the latest improvements in greenhouse building and heating, is on a scale never before attempted. It should be in the hands of every one interested in gardening, as it contains many practical hints on the subjects of which it treats, the result of many years' experience. Price, 2s. post-free.
 A large number of the illustrations are taken from greenhouses erected by us in various parts of the country; an inspection of this Catalogue shows, therefore, buildings the efficiency of which has been well tested by actual use. The advantages possessed by us enable us to carry out work with the utmost promptness, and in the very best style, at prices which defy competition. Surveys made, and gentlemen waited on in any part of the country. Plans and Estimates free on application.

SANDER'S GREAT SALE

FRIDAY, AUGUST 4, 1893, at
MESSRS. PROTHEROE & MORRIS' CENTRAL SALE ROOMS,
67 and 68, CHEAPSIDE, LONDON, E.C.

A SPLENDID IMPORTATION, GUARANTEED TRUE, OF
CATTLEYA REX (J. O'BRIEN),
Collected by one of our most experienced Collectors.

Mr. J. O'Brien says this grand new species is **THE KING OF THE CATTLEYS.**

Awarded Two First-class Certificates by the Royal Horticultural Society.

Mr. J. O'Brien says: "Taking the flower at a glance, the nearest thing I can liken it to is the *Cattleya Imschootiana*, for which Baron Schroder received a First-Class Certificate at the Royal Horticultural Society, but this is different, and superior in every respect."

The *Gardeners' Chronicle* says:—"Six flowers on one inflorescence were noted, and there is little reason to doubt that, under cultivation, this Orchid will develop in beauty, and take rank among the very finest of the genus."

Our plants show up to nine and ten flower-seats on a single inflorescence.

CATTLEYA REX,

A WONDERFUL IMPORTATION, JUST TO HAND,

In superb order and condition, of this the ne plus ultra of the genus—the finest importation yet brought to Europe.

The plants offered are truly magnificent, and many of the masses are simply grand.

EVERY PLANT WILL BE OFFERED.

The type of our importation may be imagined by the fact that we are able to show on the day of Sale great masses, with flower-spikes equal in size to *Cattleya gigas* Sanderiana, and showing as many as nine and ten flower-seats on a spike, this being quite unprecedented in the history of this *Cattleya*.

EULOPHIELLA ELISABETHÆ.

An exquisitely beautiful New Orchid from Madagascar, for which a new genus has been created.

Mr. R. A. Rolfe, of Kew Gardens, the author of the genus, has examined our plants, and certified them true.

The *Gardeners' Chronicle* says:—"It was decidedly one of the most remarkable Orchids—if not the most remarkable plant—in the last Ghent International Exhibition."

Mr. Watson, in the *American Garden and Forest*, says:—"This is a plant of extraordinary interest and beauty, with white flowers, a yellow lip, and rich crimson-purple sepals."

The *Gardeners' Chronicle* says:—"The flowers are as large as those of *Odontoglossum citrosimum*, white, with the outer surface purplish-red, callus of the lip orange-yellow."

The Plant then exhibited came from M. Hamelin.

EULOPHIELLA ELISABETHÆ

Is a Madagascan plant, and all and every plant now in Europe were collected by M. Hamelin. *Vide* Sallerin's letter in *Gardening World*.

150 splendid growing plants will be offered, and each and every plant is guaranteed.

CATTLEYA GIGAS — (SECTION of SANDERÆ).

ESTABLISHED, BUT UNFLOWERED PLANTS.

From the same importation came the superb *C. gigas* Sanderæ, which received an award of merit from the Orchid Committee of the Royal Horticultural Society on June 6. The lovely variety named after Hamar Bass, Esq., and which Mr. James O'Brien with justice declares to be the richest in colour of any known *Cattleya*—also flowered from this importation as well as the grand variety *Rothschildiana*, and now we have a letter from M. le Duc de Massa, saying that he has just flowered a plant, with pure white sepals and petals, very large and very broad, and with a labellum of surpassing brilliancy. All these, and many other magnificent forms have flowered from the importation offered now. *The plants are unflowered, and are strong and healthy.*

CATTLEYA LABIATA.

The true Autumn-flowering labiata, Sander's finest type.

Which produced the *labiata alba*, Hardy's superb variety, the chaste and elegant *Sanderæ*, the rich *Sanderiana*, Le Doux's variety, and many others of great beauty and excellence.

The NEW *CYPRIPEDIUM SARGENTII*, the NEW *CYPRIPEDIUM NICHOLSONIANUM*, the NEW *CYPRIPEDIUM MASSAIANUM*, *SOBRALIA XANTHOLEUCA*, *CŒLOGYNE SANDERÆ*, *CYMBIDIUM HUMBLOTHI*, *CYMBIDIUM CYPEREFOLIUM*, *DENDROBIUM NOBILE* from the Lang-tang mountains, *DENDROBIUM NOBILE CORKSONIANUM*, and *SANDERIANUM DENDROBIUM LEECHIANUM*, *RENANTHERA STORIEI*, *PHAIUS AMABILIS* and *SANDERIANA*, *PALUMBINA*, *CANDIDA*, *ONCIDIUM GRAVESIANUM*, &c., &c., &c.

THE Gardeners' Chronicle.

SATURDAY, JULY 29, 1893.

THE WORLD'S FAIR.

THE most remarkable out-door display of the season at Chicago, and, it seems likely, the most remarkable show of the exposition, was the *Rhododendron* and *Azalea* display in May and June. These showy shrubs, though largely of American origin, are but little known through the Western States, and they were a novelty to many visitors.

It must be owned frankly that the foreign exhibitors bore the palm in these displays, and the American growers were far behind them. In *Rhododendrons*, the finest displays were those of Anthony Waterer, Knap Hill; John Waterer Bagshot; and J. J. Moser, of Versailles. Mr. Anthony Waterer's plants, which were at the foot of the terrace north of the Manufactures Building, were really superb, a bank of noble specimens, covered with bloom. The plants of *Everestianum* were specially noticeable in this collection; *Lady Eleanor Cathcart* was shown in fine form, and *album elegans*, *purpureum elegans*, *Fleur de Marie*, and *Michael Waterer* were splendidly bloomed. This bank of bloom, below the stately building, formed a fine landscape feature, but owing to the exposed situation, the plants were sheltered by an awning. The glaring sun and harsh lake winds combined, are very hard on blooming plants.

The John Waterer *Rhododendrons* are planted out on the Wooded Island, and consist of large and striking specimen plants, which made a forest of bloom. *Everestianum*, John Walter, *Rosenm elegans*, and other well-known sorts were flowered. The size of these specimens, some of which were 8 or 10 feet high, made them very noticeable, and they were universally admired.

J. J. Moser, who ranks with the Waterers for the excellence of his display, had some large specimens displayed in the Horticultural Building, among them big plants of *Caractacus*, which were excellent, but the bulk of his collection was arranged by the landscape department at the north end of the Woman's Building.

The Belgian *Rhododendrons* came from the Ghent Horticultural School, A. Dallièrre, Ch. Vnylsteke, and De Smet Bros.; they were generally good, though in some cases there were but few varieties. The Boskoop Nursery Association, W. Van Kleeff & Sons, and Blaoun & Sons, made displays of small or medium plants; among them were fine forms of *R. Catawbiense*. The display of new varieties was small, and those shown were young plants, from which but little could be judged. T. J. Seidel, of Dresden, who showed new plants, had among them a very good white, *Helène Schiffner*, which appears a good thing.

In *Azaleas* a very showy bed of the Knap Hill seedlings was shown by Anthony Waterer; they bloomed to perfection, and may be considered the showiest *Azalea* display there, though the Belgian exhibitors showed some good plants of Ghent and

mollis, and *A. glauca stricta* was displayed in good bloom by J. J. Moser and others. *A. pontica* and *A. Van Houttei* were at their best the first week in June, while the *Azalea* season was ended by *A. arborea* and *A. optima*, which were in bloom the first week in July. These last named were exhibited by Parsons & Sons of Flushing, N.Y., who made a good display of our native *Azaleas*. Pitcher & Maoda had some attractive *Azalea* beds, and also fine specimens *Rhododendrons*. Ellwanger & Barry, Rochester, N.Y., and F. W. Kelsey of New York, were among the American exhibitors.

The herbaceous planting on the Wooded Island has been most attractive, especially the work of the Floricultural Department. The hardy planting by exhibitors is too formal in character to be really effective, but where it has been informally grouped along the shrubbery, it is charming. Mats of *Forget-me-Nots* and hardy *Pinks*, big clumps of *Delphiniums* and *Columbines*, and glowing oriental *Poppies*, have kept up a constant show of bloom. A border of *Canterbury Bells* was a feature during June; superb flowers, in all colours and types, and though such an old familiar flower, it was one of the show features of the island.

So far, the horticultural department of the Fair has been noticeable for its utter absence of remarkable novelties, so it was an occasion when Mr. Dimmock arrived with Mr. Sander's Ghent prize-winners, *Alocasia Watsoni*, *Dracena Saoderiana*, and *Oreopanax Sanderianum*, all figured in your columns. These remarkable plants were arranged beneath some of the New South Wales Tree Ferns, in the north wing of the building. All the specialists were in raptures over them, particularly the *Dracena*, which appears to have made the deepest impression, though the rich colour of the *Alocasia* and noble habit of the *Oreopanax* were much admired. All three plants were in perfect order, looking as if a journey of 4000 miles or thereabouts was a mere bagatelle. It is a fine test of their ability to stand shipment. But it is to be feared their beauty and rarity were caviare to the average visitor. We are looking forward to good displays of *Gloxinias* and tuberous *Begonias*; the latter are to be used extensively in bedding. *E. L. Toplin, Chicago.*

NEW OR NOTEWORTHY PLANTS.

DIPLADENIA EXIMIA, Hemsl., n. sp.*

An exceedingly beautiful species of this tropical S American genus, which I have neither been able to match in the Kew herbarium, nor identify from the descriptions of other species not represented at Kew by authenticated specimens. In the rich deep rose colour of its flowers, *Dipladenia eximia* is nearest *D. acuminata* (*Botanical Magazine*, plate 4828), but otherwise it is very different. Indeed, it is a miniature by the side of such species as *splendens* and *Breareleyana*, yet it does not suffer by comparison, for what it loses in size it gains in compactness. The broadly elliptical or almost orbicular leaves are from 1 1/4 to 1 3/4 inch long, with close lateral nerves and short stalks. The flowers are from 2 to 2 1/2 inches in diameter in the one cluster before me, but as I know nothing of the conditions under which the plant was cultivated, I can form no judgment as to whether these dimensions are normal. Concerning the habit of the plant, I can say nothing beyond my opinion that it belongs to the section having climbing or trailing stems. *Dipladenia eximia* was sent to Kew for determination by Messrs. Sander & Co., of St. Albans. *W. Botting Hemsl.*

* *Dipladenia eximia*, Hemsl., n. sp.—Folia breviter petiolata, papyracea, omnino glabra, late elliptica vel fere orbicularia, maxima visa cum petiolo 1 1/4 poll. longa, abrupte obtuseque acuminata, margine leviter recurva, venis primariis lateralibus utrinque circiter 9 costaque supra impressa subtus elevatis. Flores racemoso-cymosi, cymis paucifloris, breviter pedicellati, saturate rosei, 2—2 1/2 poll. diametro; calycis lobi linearis-subulati, subquadrati, circiter 2 lineas longi; corolla infundibularis, tubo infra medium anguste cylindrico, lobis latis oblique rotundatis apiculatis; genitalia omnino inclusa. Folliculi ignoti. *W. B. H.*

LILIUM LOWII* (see Fig. 29).

This is a Burmese Lily, described by Mr. Baker in the *Botanical Magazine*, t. 7232, May, 1892. It has been exhibited lately by Messrs. Hugh Low & Co., and our illustration (fig. 29, p. 121) is taken from a plant in their collection. It is a tall-growing Lily, with linear-lanceolate leaves. The flowers, in groups of three, at the top of the stem, are drooping, bell-shaped, with segments broadly lanceolate, slightly recurved at the tips, and with a prominent midrib. The colour is as of ivory, flushed with green, and densely spotted with purplish-red at the base of the segments inside.

DIDYMOCARPUS LACUNOSA,† J. D. Hook.

A lovely little plant (shown on Tuesday last at the Royal Horticultural Society), with intensely violet-blue nodding flowers, introduced by Messrs. Veitch from Penang, and of which Mr. Curtis collected specimens on damp rocks near the coast in the island of Langkaur, on the west side of the Malayan peninsula, north of Penang. It is a stemless Gesneriad, with stalked cordate ovate hairy leaves, about 1 1/2 inch (4 cm. long, rather less in breadth); the upper surface is deeply pitted. The flower-stalks, which spring from the centre of the tufted leaves, are 5—6 inches high, slender, leafless, and bear at the summit a tuft of flowers, all directed to one side. The individual flowers, which are like those of a *Gloxinia* in miniature, and deep violet-blue in colour, are about 1 1/2 inch in length (3 cm.), irregularly tubular, tube ostended on the under surface, mouth slanting, lobes of limb shallow, roundish, reflexed; three lower ones larger than the two upper.

KEW NOTES.

RHODODENDRON SMIRNOWII.—This distinct and promising species of *Rhododendron* has lately flowered in the arboretum nursery at Kew, where it has been grown since 1886, and is now a compact leafy bush, a foot high. It is as hardy as *R. caucasicum*, to which it is evidently closely allied, but it differs from that and all other hardy *Rhododendrons* in its thick layer of felt-like wool, which clothes the under-side of the leaves, petioles, and branches. The leaves are oblong, blunt at the apex, the margins revolute, and the texture leathery. The largest leaves are 4 inches long, and 1 1/2 inches broad, and the petiole is an inch long. The flowers are borne on the ends of the shoots, as in *R. caucasicum*; they are characterised by a small saucer-shaped calyx, a campanulate corolla 1 1/4 inches long, ten unequal stamens, shorter than the corolla, and hairy at the base; style, declinate glabrous; colour, bright rose-purple. The dark green of the upper surface of the leaves, and their felted under-side, together with the sturdy growth, hardness, and ever-green characters of this plant, are likely to bring it into notice, especially with breeders of garden *Rhododendrons*. It was described by Trautvetter in *Acta Horti Petropolitani* in 1884, and poorly figured in *Gartenflora*, apparently from a dried specimen, two years afterwards. It was discovered on the Asiatic side of the Caucasian Mountains, along with *R. ponticum* and *R. Ungernii*. *W. W.*

RHODODENDRON UNGERNII.

This *Rhododendron* is grown at Kew by the side of *R. Smirnowii*. They are not unlike each other in habit, but there are good characters by which they can easily be distinguished, even when not in flower. *R. Ungernii* has larger leaves, with cuspidate tips, and the felt on the under-side is white, whereas in *R. Smirnowii* it is pale brown. In the flowers there is a marked difference in the size and form of the calyx-lobes, which in *R. Ungernii* are lance-shaped, and half-an-inch long. The flowers are borne in large compact terminal heads, and the corolla, which is campanulate, obtusely five-lobed, and 1 1/4 inch long, is white, with reddish spots and a tinge

* *Lilium Lowii*, Baker, in *Bot. Mag.*, t. 7232, syn. *L. nepulense*, Collett et Hemsl., in *Journ. Linn. Soc.*, vol. xxviii, p. 138, t. 22, non Don.

† *Didymocarpus lacunosa*, J. D. Hooker, in *Bot. Mag.*, May 1, 1892, t. 7236.

of green. This species has not yet flowered at Kew. It was discovered near Batoum by Baron Ungern-Sternberg, growing under the shade of *Picea orientalis* along with *R. Smirnowii*, where it formed a shrub 10 feet high. It was named and described by Trautvetter in *Acta Horti Petropolitani* in 1884. The most remarkable character of these two *Rhododendrons* is the layer of felt-like wool which clothes the leaves on the under-side, a character not uncommon in the Himalayan species of the genus, but unknown in the garden *Rhododendrons*, of which *R. caucasicum* is one of the progenitors. *W. W.*

FRUIT, AND THE WEATHER.

Your correspondent, "Wild Rose," has started a very interesting subject in his remarks on the fruit crops this year, and though I must plead guilty to being one of the theorists (though not in meteorology—Heaven forbid!) whom he distrusts, yet perhaps he will bear with me while I say a few words on the subject.

In 1881 I committed myself to the theory that, as Pears make their growth earlier than Apples, a hot July and August means a good Pear crop, and a hot August and September a good Apple crop, for the following year, allowance being made for spring frosts. The following Table shows the mean maximum temperature of last (1892) July, August, September, and the averages of the preceding twelve years here.

Mean Maximum.			Rainfall.		
	1892.	Average of 12 yrs.		1892.	Average of 12 yrs.
	In.	In.		In.	In.
July	64° 1	65° 2	July	2.42	2.49
August	65° 6	65° 6	August	3.04	3.36
Sept.	55° 6	63° 1	Sept.	3.43	2.45

From the above it will be seen that August was an average month in temperature and rainfall; July considerably below the average in temperature, but average in rainfall; and September far below the average in temperature, and nearly 1 inch above it in rainfall, added to which it rained on twenty-three days. It was followed by the wettest month on record for this district. The result as regards Pears and Apples is as follows:—Taking 0 to 3 to represent the range from no fruit to a good crop, I find the trees in my garden may be classified as below:—

Apples.		Pears.	
Bushes, Standards, &c.	Espaliers.	Pyramids, &c.	Espaliers.
0 = 18 trees	0 = 1 trees	0 = 0 trees	0 = 6 trees
0 = 29 "	0 = 11 "	1 = 5 "	1 = 3 "
2 = 15 "	2 = 10 "	2 = 4 "	2 = 5 "
3 = 7 "	3 = 12 "	3 = 2 "	3 = 7 "

From the above it will be seen that the Pear crop is better than the Apple (the reverse being usually the case), and espaliers, on which the wood, being more exposed to the sun, has a better chance of ripening, give a better result than bush and pyramidal trees. So far, this year fairly confirms the wood-ripening theory, though the crop, especially of Pears, is better than I should have expected from the above temperatures, &c.

But what of the crop of stone fruits, i.e., Plums, Apricots, Peaches, and Cherries? Here, I may say at once, the wood-ripening theory fails utterly. As I have shown, of the three wood-ripening months, two were bad and one only average; but this is always a bad district for stone fruits—a fact which I have always attributed to our low summer temperature not ripening the wood sufficiently. Yet this year the crop is simply phenomenal! Had anybody asked me four months ago whether I thinned my Plums and Apricots, I should have laughed at him; yet I have had to do so this year, and heavily. Well, this abnormal crop coincides with an equally abnormal spring, as will be seen by the following table:—

Mean Mar.				
	March.	April.	May.	June.
1893	51° 7	62° 7	63° 7	69° 2
Average of 12 years preceding	47° 7	52° 3	58° 7	64° 6
Rainfall.				
	March.	April.	May.	June.
	Ins.	Ins.	Ins.	Ins.
1893	0.36	0.62	1.34	1.28
Average of 12 years preceding	2.07	1.56	2.16	1.89

It is difficult to avoid connecting the two phenomena, but, granting that the warm dry spring has been the cause of the large fruit crops, it remains to be shown in what way it has acted. On this point I will not venture to offer any theory, but having given the facts, will leave the botanical physiologists to draw their inferences. I may, however, anticipate some possible suggestions. It was not the absence of spring frosts, for these are never of any consequence here; nor the dry weather, for that is of common occurrence during the blossoming time; nor fertilisation of the ovaries by insects, for

vague impressions and recollections, that we shall ever arrive at understanding the causes that affect our crops, but by a patient, and, above all, accurate record of facts. *Alfred O. Walker, Nant-y-Glyn.*

ORCHID NOTES AND GLEANINGS.

LÆLIA MONOPHYLLA.

This pretty scarlet Jamaican highland plant may be now said to be well-established in cultivation.

STANHOPEA INODORA.

Although introduced to gardens from Mexico by Loddiges in 1843, it is very seldom this species is to be found in gardens; indeed, all the species, except *S. oculata* and *S. tigrina* seem to be uncommon. Of the one named, we received flowers from Mr. G. Cragg, gardener to W. C. Walker, Esq., Percy Lodge, Winchmore Hill. It is almost wholly pale-straw yellow, the base of the lip having an orange shade, and on each side of it a spot having the appearance of a partially-obliterated blotch. There are some very minute purple dots also on the labellum.

FIG. 29.—LILIUM LOWIL. (SEE P. 120.)

a note in my diary states that Hymenoptera (bees, &c.) were scarce at that time, and the flower-haunting Diptera (two-winged flies) certainly not unusually abundant.

Everybody who has paid any attention to fruit-growing, knows that no single cause will account for good or bad crops. In addition to climatal conditions, the treatment of the trees, the nature of the soil, injurious insects (worse this year than I have ever known them), and probably many other agents, have all to be taken into account. But I feel reasonably confident that the character of the preceding summer is an important, if not the most important factor in determining the crop of the current year so far as Apples and Pears are concerned, while it is clear, from this year's experience, that it has little or no effect on the crops of stone fruits. And, let me add, it is not by dogmatic assertions, based on

Some time ago, Sir Trevor Lawrence, who grows it well and admires it much, had a specimen with over a score spikes of flower. Of it Norman C. Cookson, Esq., Oakwood, Wylam-on-Tyne, says:—"Our plants of *Lælia monophylla* are now in flower. The strongest has three spikes, and the best spike has three flowers. It is a very pretty thing, with flowers of good shape and lovely colour, and it should also prove valuable for hybridising." The largest flowers we have seen of it were on a plant grown by Walter Cobb, Esq., Silverdale, Sydenham, who says he finds it very easy to grow and flower in a tolerably cool house. It comes from the region of Filmy Ferns and mosses, alt. 4500 feet, and consequently will not stand drying-off or a dry air, even if kept watered. Messrs. B. S. Williams & Son also grow it well, and gave a good figure of it in their *Orchid Album*. *J. O'B.*

STANHOPEA SACCATA.

Another singular species, having a general resemblance to the preceding, is *S. saccata*, which comes from Mr. Duncan, Warnham Court Gardens, Ilorsham, but this may readily be distinguished from all others by the pouch beneath the labellum.

EPIDENDRUM PUSILLUM.

A flower of this pretty species, from Major-Gen. A. Hutchinson, Owthorpe, Bournemouth, shows it as a very distinct and attractive species. The nearly equal ovate-acute sepals and petals are pale yellow, lightly freckled front and back with chocolate colour; the column and side-lobes of the labellum are emerald-green, the rounded front-lobe white, closely veined with bright purplish-crimson. It is what the florist would probably call "a botanical plant," but it is a pretty one, nevertheless. *J. O'B.*

DENDROBIUM DENSIFLORUM.

This is one of the most popular Orchids among growers for its robust habit, and the freedom with which its dense racemes of flowers are produced. It is a native of Nepal, and so requires warm treatment, and abundance of water in the growing stage. It is very like *thysiflorum*, but *thysiflorum* has terete, not angular, stems; and *densiflorum* has usually yellow flowers, with an orange-coloured lip. The specimen shown in our illustration (fig. 30, p. 123) was grown by Mr. Prinsep, gardener, Buxted Park, who kindly furnished us with the photograph.

REMARKS ON THE FRUIT CROPS OF 1893.

[For Tabulated Summary, see p. 89.]

O, SCOTLAND, N.

MORAYSHIRE.—The Apple crop in this district is the best we have had for some years. Pears a thin crop, and the fruit small. Plums are plentiful on all trees on walls, but thin on standards, except Victorias. Apricots are an exceptionally heavy crop, but are all greatly in need of rain for all sorts of fruit trees, which are fully a month earlier than the average of seasons. *Chas. Webster, Gordon Castle.*

NAIRN.—The fruit crops here are mostly under average, with the exception of Gooseberries. Black and red Currants, and Raspberries are very good. (Owing to the extreme heat and dryness, Strawberries failed to swell to full size, but the late ones, such as Elton Pine, with the change of weather, and a good fall of rain, will most likely give a fair crop. *James Maitland, Cawdor Castle.*

I, SCOTLAND, E.

ABERDEENSHIRE.—Apples on standard trees are almost a complete failure. Trees on walls—especially young trees—are carrying a large crop. The only reason that can be given for the failure on standard trees is the extra heavy crop of last year, and the want of vigour in the blossoms, and possibly the dry weather when they were in blossom. Plums set an enormous crop; in some cases, at least, two-thirds had to be thinned out. Small fruits have suffered very much from the attacks of aphides, but still have a fairly good crop. *J. Forrest, Haddo House Gardens.*

— Apples a fair crop in some gardens, others very poor. Pears very few; all over. Plums pretty good in most places. Black Currants nearly a failure. Gooseberries and red and white Currants about half a crop. Cherries rather poor. *G. Tait, Castle Forbes, Whitehouse.*

CLACKMANNANSHIRE.—The fruit crop here in the Devon valley is, with the exception of Pears, above the average. Small fruit, especially so; I gathered the Noble Strawberry in the first week of June, which is some three weeks earlier than the general average of the last ten years. *G. McLeod, Harveston Castle, Dollar.*

EAST LOTHIAN.—With the exception of the Pear crop, which is under the average, little bloom, having been produced this year, and of Strawberries, the plants having been damaged by the severity of the winter, all kinds of fruit are abundant, and of good quality. Rain came in good time to make this not only an abundant fruit year, but also a year for good quality. *R. P. Brotherston, Tynninghame.*

— This has been one of the best seasons I remember for all sorts of outdoor fruit, especially the small fruits. Apricots and Plums had to be severely thinned. Apples are a much better crop than last year, and the best this season are, Warner's King, Keswick Codlin, Stirling Castle, Tower of Glamis, Ecklinville, Grange's Pearmain, and Worcester Pearmain. Pears are good on Jargonelle, Louise Bonne of Jersey, Beurré Diel, Beurré Rance, but on some other varieties we had a more regular crop last year. *Wm McKelvie, Broxmouth Park, Dunbar.*

FIFESHIRE.—In most of the places in this district that I have visited, all the fruit crops are good; Apples being over the average, and looking well. Strawberries I never observed better. Laxton's Noble, Garibaldi, Dr. Hogg and Elton Pine being the best among the many kinds that are here. *A. McInnes, Palace Gardens, Falkland.*

FORFARSHIRE.—The Apple crop in this district will scarcely be up to the average, although the blossom was very promising, and the set was very irregular, some trees having a full crop, whilst others have very few or none. Peaches and Nectarines are scarcely grown out-of-doors hereabouts, and very few Apricots. Early Strawberries suffered from the drought, but the late varieties, which are just beginning to ripen, have been benefited by the rain, and promise to be a good crop. Small fruits are plentiful, but Gooseberry bushes, in some cases, have suffered much from red-spider. *W. McDowall, Brechin Castle Gardens.*

— Apples showed abundant blossom, and are a promising and fine crop. Pears, generally, a poor crop here, are scarcer this year. Gooseberries and Currants suffered from the ravages of insects, but with timely applications of insecticides we shall have a fine crop. Strawberries have benefited by the showers of late, and are a fine crop of good quality; and fruits, on the whole, are looking well. *T. Wilson, Glamis Castle Gardens.*

KINCARDINE.—Apples on standards are a complete failure, and on walls there are but few. The Pears are also a complete failure, whilst red and white Currants are excellent in crop and quality. *J. M. Gairns, Arhuthnot House Gardens, Fordoun, N.B.*

— The crops of Apples, Pears, and Plums are the worst that I have seen for at least seven years. Last year was very cold, rainy, and sunless, and fruit did not ripen well, or attain its usual size, and the wood was quite green at pruning time, so that I quite expected a bad fruit year; many of the trees do not look at all healthy. *William Knight, Fasque, Laurencekirk.*

MID-LOTHIAN.—After such a cold wet summer and autumn as we experienced last year, a good crop of fruit could not be looked for under the ordinary conditions of our climate during the past twenty years. The rain abated towards the end of September, and although the winter was rather severe, the snow protected vegetation so much that comparatively little harm was done; and both the wood and buds of fruit trees continued to mature or ripen right through the winter. When spring came, it proved dry and warm, and fruit trees blossomed and set their crops under the most favourable conditions. No frost was registered here after the 29th of March. Most kinds of fruit set very thickly; but the long drought and the badly-ripened wood of last season combined thinned many of the thickest-set crops. Still, with the exception of Peaches and Nectarines, all kinds of hardy fruit are a good average, or over it. Insects were rather troublesome for a while, and some Gooseberries and Currants were quite destroyed by aphides and red spider; but the downpour of rain which fell on June 22 and 23, cleared most of the insect pests away, and since then there has been no renewal of the attack. As a rule, fruit trees are in vigorous health, free from insects, and already showing prominently next season's fruit-buds. Apples are generally bearing well, very few varieties not bearing an average crop, and such standard varieties as Ecklinville, Stirling Castle, Warner's King, King of the Pippin, Duchess of Oldenburg, Worcester Pearmain, Blenheim Pippin, Kerry Pippin, Keswick Codlin, Cellini, Cox's Orange Pippin, Yorkshire Greening, Northern Greening, and Tower of Glamis, are carrying excellent crops of very fine fruit. The Pears with the best crops on walls, and also as bushes and standards are Beurré de Amanlis, Beurré de Aremberg, Beurré Diel, Marie Louise, Louise Bonne of Jersey, Hacon's Incomparable, Napoleon, Williams' Bon Chrétien, and Heasle. Of Plums, Jefferson, Kirke's Early Prolific, Pond's Seedling, Victoria, and Gisborne's, have the

finest crops; but all varieties are good, and the same may be said of the Cherries, Frogmore Early Bigarreau, Black Tartarian, Black Eagle, Napoleon, Bigarreau Early Rivers, and Morello, being the best crops. Early Peaches, such as Waterloo, Alexander, Amsden's and Hale's Early, are bearing good crops, and the two first-named are now ripe. Apricots are a splendid crop, the finest for many years. Moorpark, New Large Early, Hemskirk, Frogmore Early, and several other varieties all bearing abundantly. Since the rain came on the 22nd ult., small fruits have greatly improved, and the Gooseberries and Currants which escaped the ravages of insects in the dry weather, are bearing heavy crops of first-rate fruit. The same remarks apply to Raspberries, among which Superlative has proved worthy of its name. Strawberries got the rain just in time, and turned out first-rate, especially James Veitch, and the early variety, John Ruskin. *M. Dunn, Dalkeith.*

PERTHSHIRE.—All fruit hereabouts is three weeks earlier than in ordinary years. The Carse of Gowrie orchards promise to have an extra crop of Apples and Pears of fine size. Plums are light, owing to the protracted drought. *G. Goodfellow, The Gardens, Kinfauns Castle.*

— Apples promised well, but did not set. All small fruit suffered much for want of rain, especially late Strawberries and black Currants, and Gooseberries are not so large as they ought to be either. Apricots are large and of fine quality. Peaches promise the same. The wood of fruit trees is being ripened well for next season. *P. W. Fairgrieve, Dunkeld.*

— The fruit crop throughout is the finest we have had for many years, and quite a month earlier. *J. Lunt, Keir Gardens, Dunblane.*

AYRSHIRE.—Apples are a very thin crop; the bloom seemed to me not to have strength enough to set freely, although the weather was all that could be desired—no frost or cold winds. Pears are better, and these fruits are of a good size already. Plums are a heavy crop, and all kinds of small fruits. Insect-pests have been very destructive on all kinds of fruit trees and Roses. *W. Priest, Eglinton Gardens.*

LANARKSHIRE.—The Pear crop on Clydesdale is the most promising we have had for a number of years. Apples are swelling steadily, and promise to finish large in size. Standard Plum trees in gardens and Orchards are looking beautiful, although on dry hillsides many trees dropped their fruit at the stoning period owing to the severe drought. Gooseberries, red Currants, and Raspberries have been most abundant. Black Currants on dry soils have been a failure, also late Strawberries, especially Elton Pine. I saw whole fields of Elton Pine almost dried up for want of rain. *A. Angus, Dalziel Gardens, Motherwell, N.B.*

RENFREWSHIRE.—The fruit crops in this district are very good, with the exception of Plums; Apples and Pears are very good, both old and young trees carrying heavy crops of good-sized fruits, especially where thinned. Currants and Gooseberries good, but badly infested with caterpillar and fly for awhile. Raspberries and Strawberries are very good both for crop and quality. *F. Fulford, Eastwood Park, Giffnock.*

2. ENGLAND, N.E.

DURHAM.—The fruit crops in this neighbourhood generally are abundant, and of good quality. Apples and Plums suffered from blight in the early season, but the late rains have cleaned them, and they are now looking well. Gooseberries have suffered generally from red-spider, many trees being nearly dead, while in some places caterpillars have been very destructive; but the crop is the most abundant known for years. *John Short, Hummersknott.*

— Apples looked well considering the dry season; only 1.18 inch of rain fell in June. Such varieties as Lord Suffield have good crops, although, like most other varieties, owing to the dry weather half the fruit dropped. Of Pears, Jargonelles are above the average, while other kinds are about average. Plums do not succeed on the east coast,

and the blight also was against them this year; Victoria is the best variety that we grow. Peaches are not grown. Strawberries are a failure where grown on the limestone. Gooseberries and Currants are plentiful, and the late rains have saved the entire fruit crops; the foliage is now rapidly recovering. *R. Draper, Seaham Hall.*

NORTHUMBERLAND—Apples Lord Suffield, Lord Grosvenor, Keswick Codlin, The Queen (an old variety here), Lane's Prince Albert, Eckliuville, and some others are very fine. The cold wet season of last year failed to ripen the wood of Peaches and Pears; with few exceptions the trees did not ripen well, consequently only few trees bearing crops. Plums in the open and on walls are splendid. Cherries full crop and good quality. Apricots required much thinning. Strawberries largely grown in this county. Garibaldi, Sir J. Paxton, President, Matron, Noble, Elton are all good in same

good and clean in this district. The long spell of dry weather has suited stone fruits, especially Apricots, which are a full month earlier in ripening. Peaches are under, but very good; I am much pleased with Waterloo for early work on outside walls. A "rider" of this variety which I obtained from Messrs. Veitch last November has carried fourteen nice fruits, ten of which have been gathered, the other four now ready. From an older tree, on the same wall, I gathered a fruit on June 24. *William Chuck, Brodsworth Hall, Doncaster.*

YORKSHIRE—Fruit crops in this district are good indeed. Dessert Cherries on untrained trees are a sight to behold; amongst twelve good varieties planted here eighteen years ago, including Bigarreau Napoleon, Royal Duke, Knight's Early Black, and Black Circassian, are very large and excellent fruit. Of Raspberries, the best is Fillbasket. Strawberries, the strong-growing varieties have stood the drought best, viz., Noble, Paxton, President; there is nothing

as Keswick Codlin and Lord Suffield Apples, and Doyenné d'Été and one or two other early-ripening Pears. Peaches, Nectarines, and Apricots on south walls are better than usual; the roots of these are occasionally lifted in autumn, consequently they are more under the influence of the sun's warmth. Strawberries were an indifferent crop as a whole; Ne Plus Ultra, usually a good cropper, was almost barren; Noble was the best as to crop. We picked our first dish on May 26 from the open ground—fully three weeks earlier than the first picking of any Strawberry for the last twenty-one years. Gooseberries and Currants are good crops, but owing to the long period of drought, beginning early in March, the fruits were not so fine as usual, and they were ripe much sooner; and in the case of Currants, did not keep so long, being now actually all picked. We have had grand rains the past month, and the trees generally of all hardy fruits are healthy. *H. J. Clayton, Gardener, Grimston Park, Tadcaster.*

3, ENGLAND, E.

CAMBRIDGESHIRE—The Gooseberry crops in some gardens in this quarter were an almost total failure—in others better than average; but all gardens were terribly infested with red spider, so much so that acres of bushes looked and still look as though they were burned, and many pounds have been expended in dressing them, while the prices realised have been disastrous in this extreme. Many tons have not brought home 30s. per ton. Black Currants are a total failure in this district; and Raspberries only about half a crop. Apples in most gardens are good; Plums very variable. Some sorts very light, others are heavy crops. *Andrew Grant, The Vineries, Willingham.*

Essex—Apples, Pears and Plums in this neighbourhood are very partial, being in some parts almost a failure, while in other parts the trees are laden with good fruit; the trees bloomed well generally, but the sharp frost we had on April 14, viz., 10°, damaged most of the blossom in the low-lying districts. Cherries a very heavy crop, particularly Morellos; Peaches, Nectarines, and Apricots very good, the latter, better than I have had for ten years. Strawberries were almost a failure, owing to the dry weather. *J. Vert, Audley End Gardens.*

— Apples, Pears, Plums, Apricots, Peaches, and Nectarines bore at first immensely heavy crops, following a wondrously fine display of bloom. Indeed, Apple orchards were a remarkable sight during the flowering season. The drought, however, commencing on February 27, and continuing, in this district, until July 7, with the exception of three very slight showers, has greatly thinned Apple and Plum crops, though very heavy crops still remain. Morello Cherries continue very heavy crops, but the fruit is small. Bush fruits suffered in size from the drought also, secondary gatherings of Strawberries and Raspberries being partially dried up. *William Earley, Ilford.*

— The only failure has been Strawberries. They have been very bad indeed. We were three months without rain, which is a most trying circumstance for a hilly district like this. *Arthur Ocock, Havering Park, Romford.*

LINCOLNSHIRE—Apples and Pears are very small in this district. Plums are an average crop, but all the trees are very badly blighted. Strawberries were scarce and small, more especially on light land. Gooseberries are generally very good in this neighbourhood. Currants and Raspberries are very poor, and all have suffered much owing to the dry weather. *J. Rowlands, The Gardens, Bardney Manor.*

— A remarkably heavy crop of Apricots, on walls of each aspect on which they are cultivated, S., E. and W., especially S.; fruit ripening slowly. Plums a very full crop, and clean. Apples bearing abundantly, that very shy-bearer, Beas Poole, having fruited. Pears good on walls, thin or absent on pyramids—the usual result. Cherries good, Morellos very heavy. Peaches a good average,

FIG. 30.—DENDRONIUM DENSIFLORUM, AS GROWN BY MR. PRINSEP; FLOWERS YELLOW, WITH ORANGE TIP, SHOWING GOOD CULTURE. (SEE P. 122.)

place. Young plants of last year did not flower well. Some good crops on older plants. *George Harris, The Castle Gardens, Alnwick.*

— The fruit crops in general are far above the average of former years. The best crops since 1887. Gooseberries and Currants have in many instances suffered from the ravages of green-fly, especially the Whinham's Industry Gooseberries. *Wm. Fell & Co., Royal Seed and Nursery Establishment, Hexham.*

— This season will be remembered as the driest on record for forty years. Small fruits are good notwithstanding the drought. Raspberry Superlative is a grand variety; large handsome fruit very like Vicomtesse Strawberries, and excellent for dessert. Black, red, and white Currants, Gooseberries, and Apricots are extra fine. Apricots are quite a month earlier than usual. Apples set well, but large numbers dropped off when they were almost half grown. Trees and bushes look healthier now since the heavy rains of last week. *D. Inglis, Howick Hall.*

YORKSHIRE—Notwithstanding the exceptionally dry season, the fruit crops, as a whole, are remarkably

to equal Noble for size and colour, but it is wanting in flavour. Peaches look well. Apricots and Plums in open shed very good. *Baily Wadds, Birdsall Gardens.*

— The very dry weather has materially interfered with the quality of the Apple, many of the Apples having dropped in consequence. Pears blossomed very badly, and are only a poor crop. Plums are abundant throughout the district, especially Victorias. Cherries have dropped during the stoning period, but showed a very good bloom in the spring. Apricots are abundant everywhere, and the quality good. Gooseberries and Currants, both black, white, and red, are an excellent crop. Strawberries were abundant, but suffered very much from drought. *J. P. Leadbetter, The Gardens, Tranby Croft, Hull.*

— There was an abundant blossom on most kinds of hardy fruits, especially so with Apples. Owing to the dull wet season of 1892, the embryo blooms were not fully developed—at least, that is my theory to account for the thin crops of Apples and Pears as a whole. This is further proved by the ones that have good crops being early kinds, such

gathered in July. Small fruit abundant, Gooseberries particularly so—these small, owing to drought, which affected all fruit here. Strawberries, with the exception of Dr. Hogg and British Queen on west borders under average. *W. Ingram, Belvoir Castle Gardens, Grantham.*

NORFOLK.—There are good crops of nearly all kinds of fruit, particularly Apples, Apricots, Plums, and Cherries. Pears are not so good, some trees being very poor and others very plentiful. Strawberries have not been so plentiful as usual, but very fine. Red-spider, fly, and mildew have been very troublesome this year, but we have had some nice rains this week, which I hope will improve the appearance of them. *H. Batchelor, Catton Park.*

— The small fruits, although abundant, were, owing to the unusual amount of sunshine and drought, fully a month in advance of the average time of ripening, and were quickly over. The Apples and Pears are clean, and give promise of being a very good sample. Apricots and Peaches both set a very heavy crop. There has not been in this county such a drought or so much sunshine since the year 1868. *Wm. Allan, Gunton Park, Norwich.*

SUFFOLK.—The Apple crop is rather partial; King of the Pippins has a good crop; Orange Pippin, Blenheim Orange Pippin, Kerry Pippin, and Old Nonpareil are only moderate. Of kitchen Apples, Keswick and Manx Codlins, and Lord Suffield have a heavy crop, also Nonsuch and Ecklinville Pippin are large and fine. Pears are a good crop, but the fruit generally smaller than usual, owing to the very dry season; Marie Louise, Doyenné du Comice, Pitmaston Duchess, Louise Bonne of Jersey are a full crop. Strawberries have been extra plentiful and fine; British Queen and Dr. Hogg are still the best that I have seen. *Thos. Blair, Shrubland Park.*

— Speaking generally, the fruit crops in this neighbourhood are quite up to the average. Apples are plentiful, and promise to be of first-rate quality. Pears are partial. The following sorts are our best: —Burré Diel, Burré Giffard, Williams' Bon Chrétien, Burré Rance, Hayshe's Prince Consort, Duchesse d'Angoulême, Winter Nelis, Zephirin Gregoire. Plums are plentiful. Cherries, both dessert and Morellos (trained trees) are thin, but the crop on standard trees was up to the average. Peaches and Nectarines are a first-rate crop, and the same remark applies to Apricots. Of small fruits, Raspberries are the best, but not so firm as usual. Gooseberries and Currants suffered much from the continued frosts in April. On our strong soil, Strawberries were plentiful and good; but on the light land the crop, which suffered very much from the drought, was almost a failure. *H. Fisher, The Gardens, Flinton Hall, Bungay.*

— The fruit crops under liberal culture and fair conditions are wonderfully good for the season. I felt compelled to put small to some of the main crops instead of good, very good or bad, as neither of these terms correctly describe Apples. Strawberries and bush fruits would have been very good and abnormally heavy had the rain fallen sooner. *D. T. Fish, Bury St. Edmunds.*

— Either from drought, or imperfect setting, or both together, large quantities of Apples have fallen from the trees; still, there will be heavy crops. Pears set less freely than Apples, and crops are more partial. Plums are heavily cropped, and appeared to need rain more than other fruit trees. Cherries have withstood the dryness better than Plums, but fruit has been small in size. Peaches and Nectarines set freely, as also did Apricots, and trees of the latter are clean and healthy, carrying a heavy crop of fruit. Small fruits have been plentiful, but undersized, with the exception of Black Currants which have been good samples. Gooseberries have suffered much from the ravages of caterpillars; and Strawberries have been neither plentiful nor good. *J. Wallis, Orwell Park, near Ipswich.*

BEDFORDSHIRE.—Apples, the early ones, are of good flavour, and ripening much earlier than usual.

Plums small, through lack of moisture in the soil; and I may say the same of Strawberries and Raspberries, which have lasted a very short time, although well watered. Gooseberries and Currants very much eaten by caterpillars. *H. W. Nutt, Flitwick, Amphill.*

BEDFORDSHIRE.—Apples are an excellent crop. Pears on the walls and in the open very fine this season. All bush fruits are a good average crop, especially Gooseberries, and considering the dryness of the season, the bushes are making good clean growth. Strawberries promised wonderfully well in the spring, but the drought prevented many of the fruits from swelling. *G. H. Maycock, Luton Hoo, Luton.*

BUCKS.—The fruit crops, speaking generally, are fairly good in this district. All fruits are, and have been, rather under-sized, owing to the excessive drought. Of the kinds enumerated in the tabulated list, the two first, namely, Apples and Pears, are the worst; the former are much under the average; many orchard and dwarf trees are almost fruitless; green-fly has also been very troublesome. Cox's Orange Pippin, King of the Pippins, and Devonshire Quarrenden, among orchard trees, are well-cropped, while of dwarf pyramids on the Paradise stock, Ecklinville Seedling, Prince Albert, Lord Grosvenor, Potts' Seedling, Winter Hawthornden, Bismarck, and Cox's Orange Pippin are equally good. Pears on walls are thin, the best being Williams' Bon Chrétien, Pitmaston Duchess, and Seckle. Orchard trees of Williams' Bon Chrétien and Burré de Capiaumont are heavily cropped; they escaped the frost which destroyed the blossom on the dwarf pyramids of these latter; Burré Diel, Doyenné du Comice, Glou Morceau, Williams' Bon Chrétien, Louise Bonne of Jersey, and Madame Treve are carrying about half a crop. Plums are, in all instances, a heavy crop. Cherries, Peaches, Nectarines, and Apricots are also good crops. Bush fruits very abundant. Strawberries a fair crop, but rather under usual size. From north borders we are still gathering medium-sized fruits of Oxonian and Elton Pine. Filberts a good crop; cobs thin. *Chas. Herrin, Dropmore, Maidenhead.*

— The prolonged season of drought has not only been detrimental in its effects at the roots of fruit trees, it has moreover tended to foster the growth of insect pests. The green and black fly prevail enormously in some parts, and that terrible pest the red-spider literally covers the leaves of the trees in places, so much so, that the quantity of the fruit must certainly be somewhat affected by-and-by. The Cherry crops in this district have been enormous, and the fruit all that could be desired; scarcely any damage to be found in the way of cracking or otherwise. *S. G. Miles, Wycombe Abbey.*

— Apples abundant and good where watered and mulched, and the fruit thinned in time, both on pyramids and espaliers. Pears required thinning twice over on espalier trees, and the fruit is clean and good; but on pyramids the fruit is very thin. Plums a very light crop on close-clay land. Apricots on walls a very heavy crop of fair fruit. Gooseberries, red, white, and black Currants unusually heavy crops. Caterpillars, never seen in this immediate locality before, very troublesome. *J. Jaques, Waddesdon, Aylesbury.*

— The crops of Apples and Plums, including Damsons, are very large in this neighbourhood; the Apples are fairly clean, but Plums are blighted, and Filberts more so than ever I saw them. Among small fruits, Gooseberries, and black and red Currants, have been good and plentiful. Strawberries were soon over. We have been unfortunate in having had but few showers since early in March. *J. W. Shrimpton Aston Clinton, Tring.*

— The Apple crop is much over average, and very early. Wall fruit is early and abundant. Nuts and Walnuts both very heavy crops. Strawberries were ripe in the open air by the middle of May, and the first gatherings were large and fine; others were soon over. We began gathering Rivers' Early Prolific Plum on the 6th from bush trees in the open garden, the earliest date on record here. *J. Smith, Mentmore.*

4, MIDLAND COUNTIES.

CHESHIRE.—All kinds of fruit trees gave an abundant promise of a fruitful year, but the drought brought a lot of maggot and aphides, which completely crippled the bloom trees. The Codlin varieties of Apples are carrying good heavy crops, but late sorts are rather short. Pears are under average and poor; fair crops of Damsons are few and far between. All small fruits are good with the exception of Black Currants; Gooseberries and Strawberries very good. *J. V. Smith, Arley Hall Gardens, Northwich.*

— Apples are a very good crop, and the quality is good. They are also unusually early. Pears are about an average crop: Jargonelle, Louise Bonne, and Marie Louise are all bearing well as standards. Plums have suffered a good deal from fly, and are thin crops. The same may be said of Cherries. Peaches and Nectarines are not much grown outside here, though there is no doubt they would have succeeded well this year. Gooseberries are an immense crop. Red Currants are good, but black Currants have suffered from the dry weather, and in many places in this county the crop is ruined by the mite. Raspberries have been good, but the dry hot weather has ripened the fruit rapidly. Strawberries have been good. Noble as an early sort is useful, though the flavour is very indifferent. As a main-crop Strawberry President has been very good. From young runners of last year were gathered some fruit that weighed 1½ oz. each. Potatoes have been unusually early and good. *Robert Mackellar, Abney Hall, Cheddle.*

— There was abundance of bloom on fruit trees in most cases, but unfortunately, as so often happens at the critical time of the fruit-setting, there was a long period of hot dry days, and cold nights, which encouraged the growth of aphides and other insects, and was unfavourable to the healthy formation of the young fruit. The foliage at first rather unhealthy, has much improved, and now looks fresh and green, and seems uninjured by the long-continued hot and dry weather. *Wm. Whitaker, Crewe Hall, Crewe.*

HERTFORDSHIRE.—The Apple crop in this district is a very partial one, trees in sheltered places having an abundant crop of fruit, whilst others are very much under the average. A few of the favourite varieties are doing well, viz., Blenheim Orange and Cox's Orange, and King of the Pippins. Pears were badly damaged by the frost on April 17, most of the bloom being killed. *C. E. Martin, The Hoo Gardens, Welwyn.*

— Strawberries set more than average crop, but failed to swell off through drought. In low-lying districts the frosts in April did much damage to Apple blossom, and destroyed the chances of a crop in many instances. Either through drought or an imperfect set, or both combined, a great deal of the fruit has fallen from trees of most kinds of Apples; but this self-thinning is rather beneficial to the trees, whereas with us the trees are heavily laden with fruit. This is the second time only in twenty-five years that I can write of our fruit crops being so uniformly good. *J. Kipling, Knebworth.*

— Apples are below average, and at the present time small; blossom was most abundant, but very weak, owing to the unusual warmth and parching winds prevalent at the flowering season; consequently, a large proportion did not set. Pears on walls are more promising; they were protected when in blossom, and have been copiously watered. Plum trees on walls have good crops, but the fruit is also very small. Cherries the same. Strawberries, a medium crop, and small, and fully three weeks earlier than last year. We are suffering very seriously from long-continued drought. Our total rainfall since March 3 has not exceeded 1½ inch. *E. Hill, Tring Park, Tring.*

— Apples set well, many have fallen through the drought and the damage done by the caterpillars, which were unusually numerous this spring. Pears are a full average on pyramid and bush trees, but on the walls they are under. All stone fruit are over

the average, Cherries are exceptionally heavy crop, and of good quality, have suffered much from green and black aphid. *G. Norman, Hatfield House.*

NOTTINGHAMSHIRE.—We rarely ever saw a fuller lot of bloom on all sorts of fruits, but cold dry east winds continued all the time, more especially when Apricots, Apples, and Pears were in bloom; on examining, they looked to be a good set, but when they should have started to swell, quantities dropped off. *A. Henderson, Thorsby, Ollerton.*

OXFORDSHIRE.—Fruit crop good all round, with the exception of Cherries, which were much subject to black-fly. The trees are clean and healthy, owing in a great measure, to our good supply of water. As showing the earliness of the present season, Waterloo Peaches were gathered on June 22; Doyenné d'Été Pears on June 26 Citron des Carmes Pears on June 30, and Beurré Giffard on July 10. The Strawberry crop although good was of short duration. Laxton's Noble and President withstood the dry weather best. Peaches and Nectarines wonderfully good, every tree having a full crop. Plums, Rivers' Early Favourite, Rivers' Early Prolific were gathered on July 10; Apples, White Juneating on June 29, Gladstone and Red Juneating on July 5. *Geo. Stanton, Park Place, Henley-on-Thames.*

RUTLANDSHIRE.—Apples and Pears flowered most abundantly, but failed to set a heavy crop. Strawberries and Raspberries have been very small from the same reason. Bush fruits have cropped heavily, and swelled off to a good size. Alexander Peach was ripe here on a south wall on June 28, quite three weeks sooner than usual. *W. H. Divers, Ketton Hall Gardens, Stamford.*

SHROPSHIRE.—We planted over 100 Apple trees two years ago, and now they are heavily loaded with nice clean fruit. We had to prop several branches, Duchess of Oldenburg never fails to give a good crop here, and many other good varieties are very satisfactory. What a mistake it is that so many hesitate to plant reliable fruit trees. We see many old cankered trees very unsatisfactory. *Neil Sinclair, Park Hall Gardens, Oswestry.*

— This, I imagine, will be a good fruit year, although Apples are falling, leaf and fruit, to an alarming extent, and unless rain comes soon, they must be small. The above remarks are applicable to Pears, Plums on walls are plentiful, not so on standards, and Damsons hereabouts have been sadly blighted with aphid, and now red-spider is playing havoc amongst them, and also on most Apple trees. Gooseberries have sold at 1d. per quart. *A. S. Kemp, Broadway, Shifnal.*

— Considering the unusual dryness of the season, fruit crops are looking remarkably well in this district. Apricots and Plums against walls required much thinning, and in a lesser degree Pears, which in all cases except cordons, which are thin, are carrying full crops, both against walls and in the open. Apples are no exception—nearly all trees require thinning. All kinds of trees are healthy, and since the rains have swelled their fruits rapidly. Altogether, I think the season most favourable for out and indoor fruit. *S. Backhouse, Onslow Hall, Shrewsbury.*

STAFFORDSHIRE.—This year, without exception, is the most fruitful season we have had at Alton Towers the last twenty-five years. Every kind of fruit is most abundant and excellent. All kinds of vegetables are the same; and, although we have suffered somewhat from want of rain, being on a cool red sandstone soil, everything looks well. Our flower-garden is quite a blaze of bloom, and never looked better. Of course, we have watered copiously. *T. H. Rabone, Alton Towers.*

WARWICKSHIRE.—This season the fruit trees showed abundance of bloom, but owing to the drought, blight, and east wind, have not done as well as first anticipated. Apples have a good average crop, noticeable among which is the King of the Pippins, which still retains its popularity for being

a good cropper. *J. Ward, Aston Hall, Sutton Coldfield, Birmingham.*

WARWICKSHIRE.—Apples are a fair crop, and the quality good with us, but I hear of them dropping in the uplands on account of the long drought. Pears are not so good in quality, caterpillar having done considerable damage. Damsons are a full crop, but the trees are infested with red-spider, which will hurt the quality of the fruit. Cherries were very small. Small fruits abundant. As to Apricots, never have I seen such a crop these twenty years; scarcely one damaged, nearly all clean, and trees in robust health, notwithstanding the very heavy crop they are bearing. *James Rodger, The Gardens, Charlecote, Warwick.*

— Fruits of all kinds are rather small in size. In this district Plums are the crop of the season, trees of a great many varieties being heavily laden with fruit; Victoria, Early Favourite, Early Prolific, and Magnum Bonum being especially notable in this respect. Early varieties of Pears, such as Jargonelle, Clapp's Favourite, and Williams' Bon Chrétien are carrying enormous crops, fruit on late varieties being less abundant. Apples were an unusually heavy crop, but the continued drought caused many of the fruits to drop. Small fruits have suffered very much from the ravages of caterpillars. *Gardener, Warwick.*

5. SOUTHERN COUNTIES.

BERKSHIRE.—I have sent you my comparative survey, which, as a whole, I think, is a correct one for this district. Apples are erratic, some trees loaded, others bearing scarcely any, and all the fruit small at present. My Irish Peach and Gladstone are nil; Pay-the-Rent, Wellington, Cox's Orange Pippin, and Wheeler's Russet varieties more than make up for the early mentioned sorts; and I have a fair produce of Keswick Codlin as my favourite early cookers. Doyenné d'Été Pear a good crop, now in use, with Williams' Bon Chrétien, Beurré de Clairgeau, and Marie Louise the best croppers, amongst others, all on standards. If water had been at easy command, and fully taken advantage of, as very fortunately it has been with me, I have no doubt the small fruits could have been made to tell a different tale, as mine have been simply enormous. Water, nets, and labour have been "the man," as Beau Brummel observed of his shirt-collars or cravats. *Robt. Fean.*

— All the crops have suffered from drought; consequently, fruits of all sorts are small. Since March 5 the total rainfall here was 1.73 in. Watering has been persistently carried on to an enormous extent through fire-hose; but, although thousands of tons have been applied, this does not compensate for practically no rain. There was an excellent show for fruit all round, and though 10° of frost on April 14 thinned the bloom considerably, there would have been good crops had the season been favourable. Strawberries have been fine, fruit firm, and travelled well—very early. First, La Grosse Sucrée were gathered outside, May 21; and I am able now (July 12) to pick a few pounds daily of Waterloo. Of bush-fruit, Gooseberries and Black Currants are very thin crops. Red and white Currants and Raspberries, fair crops. Cherries plentiful, but not large. Black-fly and maggots are very troublesome. *Owen Thomas, Royal Gardens, Windsor.*

— The fruit crop in this district is somewhat disappointing in comparison to the early prospect in spring, great quantities of Apples having fallen owing to the drought. Pears are a light crop, and generally small. Ne Plus Meuris, that with us generally bears well, is quite barren. Strawberries, Raspberries, and all small fruits much smaller than usual. Walnuts are a failure, but Cobs plentiful. *J. Howard, Benham Park Gardens.*

— Apples here and in this district, although an average crop, are very small in size, in consequence of the lack of moisture in the soil. Pears, on the other hand, have withstood the dry weather better, the crop being an average one, and the fruit exceptionally clean. Of Plums, Victoria is the heaviest crop, both on walls and orchard standards.

Apricots are a very heavy crop, and they ripened satisfactorily. Peaches and Nectarines are also good crops, and the trees are very healthy. Figs are the best crop I have ever known out-of-doors. Cherries, both dessert and Morello, have been abundant and good, but black aphid was unusually troublesome early in the season. Raspberries and bush fruits have also been good. Strawberries, although quickly over in open quarters, gave abundance of fruit, Sir Joseph Paxton being especially fine. Both Walnuts and Cobs are very heavy crops. *T. Turton, The Gardens, Maiden Erlegh, Reading.*

DORSET.—The fruits in this neighbourhood are generally very good, free from blight, with the exception of Cherries—but when the blight was removed, by heavy syringings, these fruits ripened very satisfactorily. Peaches attacked a little with mildew, but dusting the leaves with sulphur has had excellent effects; and, generally, fruit is more satisfactory than was at one time expected. *Jas. Beck, Criche! Gardens, Wimborne.*

— The fruit crops in this district, with the exception of Pears and Plums, are very satisfactory. Cherries are carrying unusually heavy crops, and are very fine. Small fruits and Strawberries have been very good, but suffered greatly from the long drought and insect pests. *W. G. Pragnell, Castle Gardens, Sherborne.*

— Apples, on the whole, will be a very good crop, notwithstanding a considerable quantity fell from the trees in a small state, which I thought was from maggot; but, after examining them, conclude it was from the drought. Marie Louise, Williams' Bon Chrétien, Glou Morceau, Madame Treyve, Beurré Diel, and Beurré Rance Pears have heavy crops. Morello Cherries are very good indeed. Strawberries very light crop, small, owing to drought, and soon over. Nuts, Walnuts, especially good. *Thos. Denny, Down House Gardens, Blandford.*

HAMPSHIRE.—Strawberries are largely grown in this district; and, in spite of the excessive drought, the crop has been a good one. Prices have ruled high, making in all a good season for growers for market. Apples are a heavy crop, almost without exception; the fruit promises to be small owing to continued drought. Plums are an exceptionally heavy crop. Pears better than usual in this neighbourhood. Peaches and Nectarines are without exception carrying heavy crops; the recent hot weather having just suited these fruits where attention in the way of watering has been freely bestowed on the trees. *E. Molyneux, Swanmore Park Gardens, Bishop's Waltham.*

— Owing to the dry season, fruit generally will be small, unless time has been found to keep the trees copiously supplied with water. Apples bloomed early and well, but the hot dry weather seemed to dry off the blossom prematurely, owing to seemingly insufficient time to accomplish fertilisation. Old standard kinds, such as London Pippin, Blenheim, Goldwell's Keeper, Deux Ans, King of Pippins, and Cellini, are carrying good crops. Pears are small, except where water has been applied freely. Peaches and Nectarines are good, and trees wonderfully clean and healthy. Apricots seemed to set every bloom, and required heavy thinning. Strawberries were very small and inferior. Bush fruits not good. Gooseberries infested badly with spider, many of the trees dying. Plums abundant and good; the same remark applies to Cherries, except early kinds, which suffered from the late frosts. *A. Maxim, Heckfield Gardens, Winchfield.*

— Apples in this neighbourhood are very good. Pears not more than an average crop, fruit good. Peaches good. Plums are carrying heavy crops; Victoria, Monarch, Archduke, Prince Englebert, and Braby's Green Gage are the best. Apricots are the heaviest crop we have had for several years. Strawberries, fruit small, and a very short season, except where there was a plentiful supply of water. Gooseberries and Currants not more than half a crop, and fruit small. *J. Bowerman, Hackwood Park, Basingstoke.*

— The Apple a most abundant crop, the heaviest that I ever remember, fruit the largest and the

earliest for many years, the trees clean and healthy. Pears good crop, fruit large and very early, and the trees clean and healthy, and making good growth. Plums most abundant crop and very early; trees blighted. Peaches splendid crop, fruits good, trees clean and healthy, and very early. Strawberries good crop, very early, and the crop soon over for want of rain. Raspberries good crop, but small for want of rain. Gooseberries and Currants most abundant crop, very early and good; trees much blighted. All kinds of fruit are good crops, and very early. *W. Smythe, The Gardens, Basing Park, Alton.*

KENT.—It is a matter of general comment that all fruit crops have never been better. Cherry-growers have reaped a grand harvest; and where this fruit will do, and given a good season, this is one of the most profitable to grow. Fruit trees themselves look better than one would expect under the trying drought, but aphid is becoming very troublesome again. Perhaps, what is suffering most is the Hops. *Geo. Woodward, Barham Court Gardens, Maidstone.*

Apart from the long-continued spell of drought, the fruit crop generally may be said to be good. Soft fruits were plentiful, but quickly over, especially Strawberries. Apples are very good, but many have fallen. Peaches, Nectarines, and Apricots very heavy crops; and Nuts never more abundant, the clusters being exceptionally fine. All trees were early attacked by vermin, but with repeated washings they are now healthy and clean. Heavy showers of rain or waterings are needed to swell out the fruit, especially on walls. All fruits are fully three weeks earlier this year. *H. Markham, Moreworth Castle, Maidstone.*

MIDDLESEX.—Apple trees blossomed very abundantly and strong, and the bloom set remarkably well, and the fruit held on well till the prolonged and excessive drought began to tell on them, when they fell very badly, ten times as many under the trees as on them. Pear trees blossomed and set well, and have not felt the dry weather like the Apples, and are now holding on well, although the fruit is smaller than usual. Plum trees blossomed well, but the blooms did not set. Cherries set well, and being in a shady position here, have done well. Peaches, although bloom was plentiful, did not set very well, a few very sharp frosts occurring about the time of setting. *A. J. Ballhatchet, Fulham Palace, S.W.*

The Apple and Pear crops in this district are very thin, although there was abundance of bloom and a heavy set, but owing to the drought the fruits dropped badly. The best Apples are Manx Codlia (Alfreston very good), Lord Derby, Lord Grosvenor, Warner's King, Worcester Pearmain, King of Pippins, and Kerry Pippin; the best Pears being Williams' Bon Chrétien, Beurré Bachelier, Louise Bonne of Jersey, and Duchesse d'Angoulême. Plums are a failure, except on cordons. Of Cherries, Morellos are excellent. Peaches (Hale's Early, Grosse Mignonne, and Royal George) are fruiting freely. The best Nectarine this year is Lord Napier. Apricots set an enormous crop; some of the early kinds were ripe by the first week in July. Small fruits were much affected by drought. *Geo. Wythes, Syon Gardens, Brentford.*

SURREY.—The fruit crop in this district may be said to be a first-rate one. Of bush fruits I have never seen better. Strawberries very plentiful and good, but deficient in weight compared with other seasons. Pears are plentiful and clear, and varieties that are not good always, as Glout Morceau; Winter Nellis and some of the Bergamots are fully developed. Since the rain, which amounts to nearly 2 inches, the fruit is swelling fast. Apples are plentiful, but seem to have suffered very much for want of moisture. Plums are a very heavy crop, notwithstanding the two previous heavy crops; the theory of one heavy crop in three must now be considered exploded. My conviction is, that if trees get plenty of moisture at the roots when the strain is carrying their crops of fruit, they will mature the buds for the next year. *A. Evans, Lythe Hill.*

SURREY.—The early varieties of kitchen Apples are the heaviest croppers this season, such as Lord Suffield and the Codlins. Dessert Apples, Court of Wick, Cox's Orange Pippin, King of the Pippins, Margil, Braddick's Nonpareil, have good clean fruits. Pears are light in most cases. Plums very heavy crop, requiring much thinning of fruits. Peaches too have good crops, and very early; Waterloo and Alexander quite fit for table. *James Friend, Rooksnest Gardens, Godstone.*

After repeated waterings and mulchings of good farmyard-manure, our Strawberry crop turned out splendidly; fruit large, plentiful, luscious, and the flavour all that could be desired, Laxton's Noble being especially noticeable. The first fruits were ripe on May 16. All other fruits abundant, but suffered from lack of rain. *J. F. McLeod, Dover House Gardens, Rochampton.*

In this district fruit seems to be of quite an average crop. In the many places where trees are sheltered Apples are heavily laden. Pears are more partial, some varieties, as Williams' Bon Chrétien, Marie Louise, Louise Bonne of Jersey, and Beurré Clairgeau are carrying heavy crops. Peaches and Nectarines I have never seen set more freely, and Apricots are fully up to average. *G. B. Baskett, Eashing Park.*

Apple crops in gardens and orchards are below the average, but some sorts have a good crop. Fletcher's Seedling is one of the best that I know of. Stirling Castle has a fair crop. Pears on walls are a fair crop, but in the open air much under average. *T. Osman, Ottershaw Park Gardens, Chertsey.*

Apples are good where the trees were mulched and watered, otherwise the fruit is small; on chalk soils the trees are infested with red-spider. Pears on heavy soils look well, but on the chalk the trees look pale, and the fruit is small. In many gardens the trees were infested with white and black aphid, but since the rain came, trees of all kinds are looking better. Strawberries on the chalk were, in many places, a complete failure. *C. Popworth, Caterham.*

The varieties of Apples which are cropping well are Prince Albert, Peasgood's Nonsuch, Lord Derby, Eckliaville, Dumefow's Seedling, Greoadier, Lord Suffield, Lord Grosvenor, Stirling Castle, Cox's Orange, Kerry and Blenheim Orange Pippins, and Brownlee's Russet. Fruit trees, especially Plum and Cherry, have been smothered with black-fly. *C. J. Salter, Woodhatch Lodge Gardens, Reigate.*

SUSSEX.—Pears Beurré Superfin, Clairgeau, Marie Louise, Pitmaston Duchess, Duchesse d'Angoulême, Louise Bonne, and Bon Chrétien are carrying heavy crops. I never saw the fruit and trees look so healthy and clean. *E. Burberry, Castle Gardens, Arundel.*

The fruit crop in this district, with the exception of Pears, is one of the most abundant that I can remember. Some of the late kinds of Pears are very short, owing, no doubt, to the severe frost during April, for on the 13th, 14th, and 15th of that month we registered 13°, 11°, and 13° Fah. respectively. Apricots were ripe on July 8; Cherries, May 25; and Plums, July 10. *H. C. Princep, Burted Park, Uckfield.*

WILTSHIRE.—The profusion of blossom with which all kinds of fruit trees were clothed in spring gave promise of the fruit crop for 1893 being a most abundant one; but, alas! the frosts which we experienced every night during the last fortnight in March (varying from 6° to 14° every night), had the effect of reducing this fair prospect, as regards non-protected Pear and Plum trees, to a minimum; and the uniformly dry and excessively hot weather which prevailed in March and three following months had a like effect upon the Apple crop. The trees, through their roots having sucked up all the moisture from the soil, a general flagging of the sheets of blossom took place, except in the case of trees in low-lying districts, with their roots close to the water-line, and while in this flabby unresisting

state, were nearly all burnt up by the sun's rays; and this semi-tropical weather continuing, the majority of the fruit which then set dropped off the trees later on. Protected trees of the Apricot, Peach, Nectarine, and Green-Gage Plum set most abundant crops, and the first three mentioned had to be severely thinned. The following varieties of the Apple (espalier-trained) in the kitchen gardens are bearing heavy crops of clean fruit, namely, Emperor Alexander, Stirling Castle, Keswick Codfin (always a sure cropper), Early Nonpareil, Northern Greening, Worcester Pearmain, and Mr. Gladstone, two highly-coloured Apples. Cherries and bush fruit very plentiful. *H. W. Ward, Longford Castle, Salisbury.*

(To be continued.)

THE WEEK'S WORK.

THE HARDY FRUIT GARDEN.

By T. TUSTON, Gardener, Maiden Erlegh, Reading.

FIGS.—The first fruits now ripening, there is every possibility of getting a second crop ripened this season; thin off quite three-fourths of the fruits that are showing, leaving the largest and those best placed. Check any gross growths by pinching, and tie-in only those for which there is sufficient room.

ORCHARD FRUITS.—Now that the more pressing work of summer-pruning has received attention, advantage should be taken of the present somewhat quiet period to go over trees, the interior of which were thinned of spray and other branches last winter, and from which numerous shoots will have grown. These should be cleanly removed with a sharp knife, and if it be done now, there is less risk of other shoots growing from their base than would be the case if left till winter.

FRUIT ROOM.—The earliest opportunity must now be taken to clean and get this ready for the reception of the earliest Pears and Apples, as when once gathering commences, it is difficult to give the necessary cleansing. With the introduction during recent years of so many imposing-looking varieties of Apples and Pears, the gardener should take special care to make the fruit-room as interesting as possible to any who may visit it during the winter months. Should the walls and ceiling require to be whitened, it should be done, and afterwards with soap and water to wipe over the shelves. Last autumn, when doing this work, I had the posts and facing of the shelves stained and varnished, the smell of which soon passed off, by leaving windows and doors open for a few days. The object was to be the better able to keep it clean, the varnished parts requiring only to be wiped down occasionally with a damp cloth. The posts and fronts of the shelves, originally square, I had chamfered some time before. The shelves may be covered with sheets of stout brown paper, which prevents the air from passing up among the fruit through the open-work shelves; and should a decayed fruit escape notice, by being left clear, it soon dries up.

PEARS IN SEASON.—Owing to the plague of wasps, Jargonelle, Windsor, and Beurré Giffard Pears now beginning to ripen must be closely watched, and gathered, if possible, before the wasps attack them. Continue to destroy wasp's nests, and to trap the insects. Besides the trap, made by placing two hand-lights, one on the top of the other, as described in a former calendar, have recourse also to the beer and sugar traps, formed of moderately wide-mouthed bottles, which should be about half filled. Put the bottles a few yards from trees where fruit is ripening, and they will allure the wasps from the fruit. Large numbers may be got rid of in this manner.

THE ORCHID HOUSES.

By W. HOLMES, Gardener, Pickering Lodge, Timperley.

LÆLIA DAYANA AND L. PRÆSTANS.—These species are at this season growing away freely, and should be well supplied with water. They do best if grown in shallow baskets, with very little material about their roots, crocks and sphagnum moss being what they chiefly require. There is then not much fear of over-doing them with water if they are healthy, a point which is applicable to Orchids generally. We grow these two species with the *Miltonia vexillaria*, where they are afforded fresh air, and moisture abundantly; and the syringe is freely employed. *Sophranitis grandiflora*, which do

well in this house, are hung up close to the roof in shallow pans, with nothing more than living sphagnum moss about the roots.

CHYSIS BRACTESCENS AND C. AUREA, having now finished flowering, should be potted or top-dressed; and the flowers, coming with the new growths, the latter must be well encouraged with a warm moist atmosphere. Our plants of these species are accommodated in the Dendrobium-house; and peat and sphagnum moss, and well-drained pots are employed for them.

HINTS ON CYPRIPEDIUMS.—The varieties and species *C. Parishii*, *C. lævigatum*, *C. bellatulum*, *C. niveum*, *C. concolor*, *C. Godefroyæ*, or any others having thick leaves, do not require so much water at the root as other Cypripediums. The leaves of the first two have much substance, and being sappy, they contain a reserve of moisture which is available for the plants during a dry time. I place the plants with fleshy leaves on the north side of the Dendrobium-house, potting them in equal parts of peat, loam, sphagnum moss, and a good proportion of clean crocks and silver-sand. To moisten them, they are doused in a tub of water, and never watered overhead; one watering in a fortnight is sufficient for their needs, and care must be taken that it does not lodge in the growths. I have seen *C. lævigatum* nearly killed with watering because the grower was advised that all the Cypripediums required plenty of heat and water. A warm, moist atmosphere is what the plants require. In regard to *C. bellatulum*, *C. niveum*, *C. concolor*, and *C. Godefroyæ*, they are more successfully grown when they are kept on the dry side, dipping them up to the rims in a tub of water, but allowing no water to lodge in the heart of the growths, this tending to loss of leaves, and eventually the death of the plant. Our *C. bellatulum*s are potted in Kentish loam and crocks, and this compost suits the others, such as *C. niveum concolor* and *C. Godefroyæ*. These species we grow in a small span-roofed house on the northern side close up to the glass, the plants liking subdued light, but not a glare. Water Cypripedium *villosum* and *C. Boxalli* very sparingly, and grow them along with *C. insigne* at the warmer part of the Odontoglossum-house. *C. insigne*, by growing in different temperatures, and having a good number of the plants, will afford flowers during a long season; it is a plant that is at home in almost any of the houses. *C. insigne montanum* and *C. exul* are fine additions to this type. I pot the *insignes* in equal parts of peat and loam, with clean crocks and sharp silver sand. A number of *C. insigne crosses* and varieties succeed in an intermediate-house.

PLANTS UNDER GLASS.

By B. WADDS, Gardener, Birdsall Gardens, York.

CHRYSANTHEMUMS.—Careful attention must now be given to the training, watering, and cleaning of these plants, the shoots being tied-in from time to time, but not too close up to the young points, or they will be broken off with the wind and rain, and it is safest to afford them from 6 to 8 inches in length. Continue to remove laterals by pinching them out with the finger and thumb, and take care not to break the principal leaves whilst manipulating the plants. Suckers should be removed, using the handle of a budding-knife in doing this, and not breaking the roots. Afford water in abundance when the plants require water at the roots; and allow plants in large pots to get fairly dry before affording water, and then a thorough soaking should follow. Manure in some form should be supplied twice, and this should be varied from time to time. Farmyard manure-water in a much diluted form may be afforded; and to be sure it is not too powerful, try it first on a plant or two, diluting it for the one and not for the other. I use it at about one-half manure-water and one-half clean water. Soot-water in a clear state may be given once a fortnight, and sometimes cowdung-water, but never use water at any time in a turbid state. If plants have a yellow look, and do not grow away, a teaspoonful of sulphate of ammonia or nitrate of soda will help them if the drainage is right, and a smaller quantity to plants in 6 or 8-inch pots. Some fine soil should first be sprinkled over the surface to protect the top-roots from contact with the manure. Earwigs abound this season, and must be destroyed, or they will injure the young shoots and buds. Search for them night and morning at the points of the shoots; also invert small flower-pots stuffed with hay or moss, these act as good traps for earwigs. When emptying the pots into a bucketful of water, give the moss, &c., a twist

round the pots. Green or black aphid may be destroyed with tobacco-powder or quassia-chips solution applied by means of a syringe. For getting rid of mildew, dust the foliage with sulphur, or syringe with sulphur-in-water mixture. Cuttings that were put into 6-inch pots towards the end of June should be placed in the open as soon as possible, sprinkling them often with a fine-rose watering-pot to prevent flagging. They must be staked and tied at the same time.

SMILAX ASPERA, S. MAURITANICA, and other varieties, will now require attention; they are very useful in the winter months for cutting for table-decoration, and are best planted in a bed of loam and leaf-soil, the shoots being trained on pieces of string up to the roof. The points of the shoots do not bear handling, and if they do but touch the string they will run alone. In large pots they succeed pretty well. The flowers are sweet-scented. When kept clean, the plant furnishes yards of greenery for furnishing purposes.

NEPENTHES.—Among interesting and beautiful plants for growing in baskets in the moist-foilage-house, *N. distillatoria*, *N. sanguinea*, and their numerous hybrids, take high rank. The plants grow well in a temperature of from 65° to 85° during the summer, and 60° to 70° in the winter, in baskets filled with fibrous peat and sphagnum-moss, in about equal parts, to which should be added some fertilising moss or other manure, in moderate quantities. They are rather subject to be infested with thrips, and require copious syringing to rid them of these pests, and abundance of water during the summer, but not so much during the winter—but they must not be allowed to get dry even at that season.

FRUITS UNDER GLASS.

By M. TEMPLE, Gardener, Carron House, Falkirk, N.B.

PINES.—The advice often given regarding the watering of Pine-apple plants, is to afford them plenty of water, but this, in certain cases, is misleading, as Pines at any season require much less water than many other species of plants, because, being plunged, they do not require half so much water as plants standing on a stage. Now that the nights are longer, water will be needed in still less quantity, and only when it is certain that the soil is getting too dry. What causes the brown and debilitated appearance of Pine-apple plants at the end of the autumn is the sodden state of the soil, owing to the frequent applications of water, made worse, perhaps, by lack of bottom-heat. Too much bottom-heat is another cause. The injury to Pines by affording water too often, is more tardy when they are planted out in beds. Allowing Pine suckers to remain out of the soil till they have become dry is destructive to their vitality, and much time is thus lost in growing them into rooted plants.

VINES.—The canes of Vines grown in pots for early fruiting, should now be matured, and when the rind is brown, the canes firm, and the leaves dropping off, they may be removed to a place where they are shaded by a wall or hedge, and the pots laid on their sides. Canes still immature, should be kept dry at the roots, and in a dryish atmosphere, with air circulating through the house. Fire-heat may be necessary in northern parts to mature the fruit buds, but the leaves must not be forced off by too severe root drying, nor by allowing red-spider or thrips to infest them. Pot Vines for decorative purposes late in the season should not be forced into rest prematurely, as they may start into growth before the proper time; but the laterals should be well pinched in and the canes exposed to light and air. The syringe may be used with some force amongst them several times a week, and an insecticide should be employed against red-spider.

ORCHARD-HOUSES.—Water at the roots must be withheld to a great extent when fruit begins to ripen, but the foliage should not droop. The lateral shoots should be reduced so as to allow sun and air to reach the fruit, and manure-water will now be little needed, and then only to aid late fruits to swell to their full size. As soon as the fruits are removed from the trees, wash the latter with the garden engine, and ascertain what is the state of the soil as regards moisture. Plants which have already been removed to the open air must not become dust-dry, and the pots may be plunged in ashes to shield the roots from the sun.

MELONS.—Some gardeners plant Melons up to the second week of August, so as to have fruit to the end of the year; and I am about to plant some in pots for this purpose. The soil should have no

manure mixed with it at this season, and growth depends rather on liquid manure afforded when the fruits are swelling. Although late Melons cannot have high flavour, the fruits serve a useful purpose at dessert if Pine-apples are not cultivated.

STRAWBERRIES.—Frequent attention is now necessary to keep the roots from growing out of the pots, rubbing them off as soon as they can be seen, picking off runners, and keeping the surface of the soil stirred.

THE FLOWER GARDEN.

By T. H. CRASP.

ROSE-BUDDING.—With the showery weather of the past week, Rose-budding should have been pushed on with, the rind running freely with the accession of sap. When Rose-budding is finished, the ground between the Briars should be hoed, and, if necessary, the weeds raked out, and a neat appearance given to the quarter.

THE FLOWER BEDS.—The rain will have started numerous weeds into growth amongst the bedding plants, and these should also be carefully hoed amongst when the surface is dry enough not to clog the tool. Pelargoniums are seeding very freely this year, and the seed-vessels should be removed at short intervals, not necessarily sacrificing the whole truss for a few seed-vessels in the middle. To leave the seed to mature would spoil the successional blooming of the plants. Attention should be given to pegging-down Petunias, Verbenas, Calceolaria *amplexicaulis*, Ivy-leaved Pelargoniums, &c., which are growing very freely. The carpet-bedding plants, Pyrethrum Golden Feather, *Mentha pulgium*, *Alternanthera*, and others of low growth, should be clipped, or pinched with the finger and thumb, and arranged so as to bring out a distinct pattern, and afford at the same time light to the centres of the plants, causing them to have a better appearance, and assume their true colour, however uniformly green they may now appear. The soil in vases and window-boxes will now be full of roots, and waterings occasionally with liquid-manure—say, once or twice a week—will be beneficial; or where that may not be convenient to apply, a mulching of good light rich soil will serve the same purpose.

THE RESERVE GARDEN.—Double-flowered Daisies, and such of the Polyanthuses as may not have been lifted this season, should be taken up forthwith, divided, and replanted. Recently-sown seeds of *Myosotis*, *Silene*, *Saponaria*, and the seeds of biennials generally, if not germinating properly, should be supplemented by fresh sowings. The seed of Sweet William may still be sown. Seedling perennials of all sorts should be transplanted, when large enough to handle, into nursery beds for one season, and afterwards transferred to the borders, &c., where they will flower; for when small plants are shifted at once from the seed-beds into the borders, they are liable to become smothered with stronger and established neighbours. Sufficient space should be left in the rows of plants to enable the hoe to be used. *Rhododendrons* and other shrubs which may have suffered from drought should still receive heavy root-waterings, and these with the rain will tend to their full recovery.

THE KITCHEN GARDEN.

By H. C. PRINSEP, Gardener, Buxted Park, Uckfield.

THE SOWING OF CABBAGE-SEED.—In the southern counties, the main lot of Cabbage-seed should now be sown, and the rains having sufficiently moistened the soil, the seed will readily germinate. I usually make one sowing at the end of the present month, and another about the middle of the month of August; the seed, if sown earlier than this, will produce plants that are apt to become too large before the ground is ready for planting. I prefer to plant on the ground which has been cropped with Onions, as if such has been well-manured and deeply-dug, there will be no further need of manure in any form after the plants are put out. One of the secrets of Cabbage-growing is to start well, and to enable the gardener to do this, the plants should not remain longer in the seed-bed after they are sufficiently large for planting, and that is one reason why the seed should not be sown too early.

TOMATOS.—The growth of the plants since the rains having become strong, the points of the leading shoots may be removed, if a good set has been obtained. If mildew be present on the leaves, dust them with flowers-of-sulphur. Tomatos in the open must be kept securely tied to the stakes, and superfluous growths removed.

EDITORIAL NOTICES.

LETTERS FOR PUBLICATION.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for contributions, or to return unused communications, or illustrations, unless by special arrangement.

PLANTS, &c., TO BE NAMED.—Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be carefully packed and numbered, and not more than six should be sent at one time.

LOCAL NEWS.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

NEWSPAPERS.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Advertisements should be sent to the PUBLISHER.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETING.

SATURDAY, AUG. 5.—Dundee Horticultural Association.

SHOW.

SATURDAY, AUG. 5. { Southampton Horticultural Society's Show (two days).

SALES.

TUESDAY, AUG. 1. { Sale of Greenhouse Plants, &c., at Woodside Nursery, North Finchley, by Protheroe & Morris.

FRIDAY, AUG. 4. { Orchids, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—63°·2.

Phloxes at Chiswick.

The trial bed of Phloxes at Chiswick is well worth seeing, the plants having considerably improved since the recent rains. Among scarlets or salmon-scarlets, Etna and Albert Crousse are very brilliant; Adonis is a flower of good form, and white flushed with salmon-pink; Prof. Briquet is a good carmine; Eugenia Dangervillers is of pale lilac, and very free. But of the several varieties we may have to speak more fully later on. The herbaceous Phloxes are derived from the interbreeding of two or three species found wild in the eastern United States from Pennsylvania to Florida. *P. paniculata*, according to ASA GRAY, has unspotted stems, lanceolate leaves tapering at the base, broad pyramidal panicles with awn-pointed sepals; *P. maculata* has spotted stems, leaves rounded at the base, narrow panicles, acute, but not awn-pointed sepals; *P. glaberrima* has linear-lanceolate leaves, very smooth, unless at the margins, tapering gradually to a point, cymes few-flowered, calyx-teeth very sharp-pointed; *P. suffruticosa*, a native of the Southern United States, is stated to be only a variety of *P. glaberrima*. The glabrescence or hairiness of the stem is so variable that no reliance is placed upon it by ASA GRAY. In cultivation, however, the distinction seems a good one, and the range of colours in the flowers is different in the two cases. *P. decussata* of gardens has, it appears, no separate existence as a wild plant, but is a blend of *P. maculata* and *P. paniculata*. Gardeners and raisers have succeeded in completely breaking down the distinctions relied on by botanists, a circumstance which is highly inconvenient, no doubt, to those who have to note and classify, but which is of the greatest possible interest to those desirous of ascertaining what the real lineage and relationship of garden plants generally is. It is not to be expected that the

man of business will, as he thinks, waste his time upon such matters, but it is one of the main functions of a Society like the Horticultural to collect, sift, and record all available evidence.

In reference to this matter, we may suggest that another season a conference or conferences should be held at Chiswick on the plants grown for trial, whatever they may be. Take Phloxes, for instance: supposing them to be selected for a third trial, let notice be given of the fact, and let botanists and raisers be told in advance of what is intended to be done; let them be requested to gather, condense, and communicate all available evidence—cultural, æsthetic, and botanical, so as to have it ready to be laid before the Society, at the time when the illustrative specimens in the trial quarters may be expected to be at their best. It is true, there have been many conferences at Chiswick, and we hope there will be many more, for they have comprised much of the best work the Society has ever done. But not sufficient pains have yet been taken to bring the Conferences into direct relation with the annual trials, and to utilise the object lessons so afforded. Again, when it may not be convenient or desirable to meet at Chiswick, why should not cut specimens or pot plants, be brought to the Westminster meetings illustrative of the trials made in the garden, as, indeed, was done in the case of Apricots last Tuesday, and why should not means be taken to explain to the Fellows present the objects and general results of the trials, leaving the more detailed and systematic record to be inserted in the Journal of the Society? In this way the vital educational importance of the experimental garden might be brought home to the Fellows, the majority of whom under present circumstances know little about the garden, to the expenses of which they contribute.

We add from ASA GRAY'S *Synoptical Flora*, vol. i., part ii., the synonymy of the three principal species of Phlox above referred to:—

P. PANICULATA:

Syn. *P. undulata cordata acuminata corymbosa scabra Sickmanni decussata.*

P. MACULATA:

Syn. *P. pyramidalis reflexa penduliflora var. candida suaveolens tardiflora longiflora. decussata.*

P. GLABERRIMA:

Syn. *P. revoluta var. suffruticosa = P. nitida Carolina triflora carnea.*

CHISWICK.—In the Royal Horticultural Society's Gardens, Chiswick, in addition to the Phloxes, above mentioned, tuberous and hybrid Begonias growing in beds in the open are now coming into bloom. Violas, of which there is a very large collection grown here, are still laden with flowers. The collection of Fuchsias present a lovely appearance in one of the houses. Cannas cultivated under glass form an interesting feature, and are very attractive. The Grapes in the conservatory and in other houses are bearing, as usual, heavy crops of good fruit. Tomatoes are grown extensively under glass, but some are sadly infested with fungi of various kinds, and some are commencing to ripen in the open. All the best varieties are grown, thus affording a good opportunity for observation to those interested in their culture.

PROFESSOR THOMAS MEEHAN.—The citizens of Philadelphia, on July 4, presented Prof. MEEHAN, a born Englishman and a well-known botanist and eminent horticulturist, with a handsome silver plaque, in grateful acknowledgment of his services to the municipality, and specially for his efforts to promote the health and pleasure of his fellow-citizens by the securing of parks and open-spaces in the great city of brotherly love. The ceremonies attending the presentation took place almost immediately after the Fourth of July oration of SHELDON POTTER, Esq. A few opening remarks on the esteem in which Prof. MEEHAN was held by his fellow members in the municipal legislature were made by Select Councilman W. FINDLAY BROWN, and then CHARLES S. KEYSER, Esq., gave a brief account of the movement for more small parks, and Prof. MEEHAN'S connection with it:—

"Since Mr. MEEHAN'S work began, an increase of park acreage for the city of more than 244 acres, has been obtained, and all but twelve wards are now provided with at least one breathing spot—which parks, while not all are yet opened, are still on the city plans. Of all this work, of this extension of the original purpose of the founder, THOMAS MEEHAN is the acknowledged head. When his work in Councils began, there were, says the *Public Ledger*, but the original squares laid out by WILLIAM PENN and a few others, not more than a dozen in all, and for the remainder which make up the nearly forty now on the city plan, Philadelphia is indebted to the noble work of Mr. MEEHAN. Looking back on the extraordinary spectacle of a man elected and re-elected for a decade of years, by the consent—nay, by the urgent desire—of the leaders of all parties and factions, pursuing steadily a work for which he was both fitted by his good judgment and by his avocations, with the results before us, we must first and most singly honour him in this connection, and testify to the obligations we, his fellow-citizens, are under to him."

In reply to the address, Prof. MEEHAN said:—

"I felt early in my youth that life was not worth living unless some good could be done to humanity, and there was some good work to do. I tried ever to keep before me these lines: 'When there is a noble deed to be done, and we are able to do it, we need no other heaven,' and in all my life-work I think I may, without vanity, say, I never thought of thanks or reward. Indeed, I now feel that this beautiful work of art is not intended as a reward, but is only an evidence of appreciation of my efforts. Thinking that, I feel encouraged to go on, for my work is by no means done. Providence has been very kind in giving me health and strength until within a comparatively short period. Now I feel that the sere and yellow leaf of autumnal life is falling about me, but I am cheered by the thought that the good work in behalf of small parks will still go on. I feel further, that what has been done here to-day for me is not an honour, but a pledge of support, and so feeling I will continue on to the end, and do what I can for the help of my fellow-man."

RAILWAY RATES AND CHARGES FOR FRUIT, ETC.—The Select Committee of the House of Commons on Railway Rates and Charges sat again on Tuesday, July 11, under the presidency of Mr. SHAW-LEFEVRE, First Commissioner of Works. Mr. BERRY, a farmer and fruit grower in Kent, was one of the witnesses examined. He said he represented the Fruit-Growers' Association, and they had hoped that a stimulus would be given to fruit-growing by reduced railway charges in consequence of the new classification by the Board of Trade. In this, however, they had been disappointed. The North of England was now supplied with fruit by Kent. The trade began twenty years ago, when the Great Northern Railway Company agreed to put one coach for fruit on the mail every night. The rate then agreed upon was 4s. a cwt., and this was considered very heavy. Now, instead of one coach, there were two special train-loads on each of the great railway lines to the North, and the charge was 4s. 3d. per cwt., except in the case of large consignments, on which reductions were allowed. This rate was calculated from a group of stations in Kent to a group of stations in Lancashire, of which Manchester and Liverpool were the chief. The extra 3d. per cwt. was put on at the beginning

VIEW IN THE GARDENS AT TRING PARK.

of this year. There had been no reductions whatever in the rates for fruit to London, but there had been a reduction in hard fruit and Gooseberries by goods trains from Selling, in Kent, to Manchester of 1s. 2d. per ton. The Fruit Growers' Association were of opinion that the Railway Commission was of no use as a tribunal to the traders. In spite of high rates the fruit trade was increasing; but if it was encouraged by a low rate, farmers and land-owners, who did not know what to grow, would increase the acreage under fruit very largely.

EDINBURGH BOTANICAL SOCIETY.—A meeting of the Edinburgh Botanical Society was held on Thursday, July 13, in the Royal Botanic Garden, Dr. WILLIAM CRAIG presiding. Mr. R. LINDSAY, Curator, communicated his monthly report on the temperature and vegetation at the Royal Botanic Garden. The past month, he said, was remarkable for the excessive heat and dryness which prevailed. A heavy fall of rain took place on the 23rd of the month, after which all danger from drought was at an end. The lowest reading of the thermometer during June was 40°, which was registered on the 2nd of the month. On the night of the 16th the thermometer did not fall below 62°. The lowest dry day temperature was 50°, on the 23rd; and the highest 89°, on the 18th of the month. Hardy herbaceous plants flowered freely, and the earlier flowering kinds had ripened their seeds abundantly. In the rock garden, fewer plants came into flower than in any June during the last eleven years. In all 294 species and varieties came into flower during the month. A number of interesting plants from the Botanic Garden were exhibited. Among these was a specimen of the Azolla in fruit. It was stated that this was the first time the plant had been seen in fruit in Great Britain.

CARNATIONS.—Mr. MARTIN SMITH'S endeavours to bring the Carnation into prominence as a border flower is worthy of great praise. We do not appreciate the refined substance, elegant form, and delicate colouring of the show-board flowers less, but we admire the more the border-flower of hardy constitution and free-flowering quality. Moreover, Mr. MARTIN SMITH'S mode of putting up his flowers must surely be the death-warrant of the absurd card-board collars, on which it is still considered the correct thing, by the more conservative florists, to exhibit their cut blooms. The collars have gone from the pot-plants, laughed at out of existence; and if they are no longer necessary for them, they are no longer required for the cut blooms. Nor are receptacles of the ginger-beer-bottle type quite the most elegant and effective that could be devised. Mr. SMITH'S plan of showing the flowers in bunches is so much more attractive, that we do not despair even of seeing the florists' varieties so treated, at least in part, for individual blooms must always be shown side by side for purposes of comparison.

"THE JOURNAL OF MYCOLOGY."—This is an official publication of the division of vegetable pathology of the United States Department of Agriculture, and devoted solely to the study of fungi in their relation to plant-diseases, and edited by the chief of the division and his assistants, nine in number. Such a staff of experts and such a publication fills us with shame and apprehension—shame that we have not in this country a single establishment, nor a single expert even, devoted especially to vegetable pathology, and this in spite of the enormous commercial interests at stake in this country; apprehension that we may be (indeed, we are) distanced in the search for knowledge by all the greater nations of the civilised world. The present publication is invaluable to students, but it is not right, as is done in the record of literary notices, to assign unsigned articles in a journal to particular individuals. The "Editor" is a composite being, the mouthpiece of his contributors, but not in all cases, or necessarily, expressing any opinion of his own.

THE CAPE EVERLASTING-FLOWER TRADE.—The species most valued as a trade "everlasting" is

says Prof. McOWAN, in the *Cape Agricultural Journal*, *Helichrysum veitatum*. Shipments of some other species have, however, been made, but irregularly and in small quantity. Their use is chiefly local, in the manufacture of wreaths, bouquets, and fancy articles generally. Perhaps the one most sought after, and most often advanced to the dignity of export, is *Helichrysum fruticosum*; then follow the red strawberry-headed *Helipterum eximium*, and colour varieties of *Helichrysum felinum*. *H. sesamoidea* gives two colours—white and lemon-yellow; *H. stellatum*, several pink shades. *H. canescens*, a deeper pink, and *H. speciosissimum*, an almost dead white; *H. variegatum* is brown and white. The strongly radiating heads of *Phenocoma prolifera* are also used as a substitute for *H. canescens*. Of late years large quantities of the elegant panicles of *Restiaceæ* have been exported, and particularly those of *Elegia propinqua*, *E. verticillaris*, *Thamnochortus fruticosus*, *T. imbricatus*, *T. dichotomus*, and *Cannomois virgata*. Customs returns of this flower export for 1890-1892 show:—

EVERLASTINGS.		
1890.—134,007 lb.—	Value declared,	£4,006 0 0
1891.—123,105 lb.—	ditto	4,918 0 0
1892.—228,450 lb.—	ditto	12,055 0 0
DRIED GRASSES—i.e., <i>Restiaceæ</i> .		
1890.—Nil	£0 0 0
1891.—48,478 lb.	710 0 0
1892.—46,566 lb.	683 0 0

FREDERICK LAW OLDMSTED, LL.D.—Gardening was recently honoured, says *Garden and Forest*, in a manner which we believe is without a precedent. On the same day the two foremost universities of America, Harvard and Yale, conferred upon FREDERICK LAW OLDMSTED the degree of Doctor of Laws in recognition of his creative genius as a landscape-gardener, which in all parts of the country has continuously impressed itself upon American civilization from the day, forty years ago, when his conception of the Central Park, New York, marked a distinct era in the formation of great urban parks, until the celebration of the four-hundredth anniversary of the discovery of America, offered him the opportunity to show to the world assembled at Chicago the possibilities of his art in a work which of its kind has never been equalled in beauty or convenience. Harvard further honoured herself in placing upon her roll of honorary Masters of Arts the name of HORATIO HOLLIS HUNNEWELL, in recognition of his attainments in horticulture, which he has practised with singular success for more than half a century, and which he has advanced by his own knowledge and example, and by his generous and enlightened support of every effort which has been undertaken in his time in this country to increase the knowledge of plants and the love of cultivating them. Academic recognition of this character, we may add, is of far higher value in such cases, and much more appropriate than are the titles given by the State to politicians as a reward for party services, or to men of business merely because they have been successful in amassing wealth. The two American Universities have followed the lead of their older sisters in England, and it is not long since Trinity College, Dublin, conferred the honorary degree of M.A. on a distinguished gardener, Mr. BURBIDGE, the author of one of the most useful books in the gardeners' library, *Cultivated Plants, their Propagation and Improvement*.

COTTAGE AND ALLOTMENT GARDENS.—It is reported that the Countess of CAERLISLE, who takes a deep interest in all movements having for their objects the improvement of the social condition of the people, has fixed eight as the number of hours mechanics and labourers should work per day on the Castle Howard estate; and, it is added, that as garden allotments are much in vogue on this estate, it is only to be expected that the new rule will tend towards their increased popularity. Some significance attaches to this statement from the fact, that on the occasion of a recent examination of a number of cottage gardens in East Berkshire, with a view of awarding prizes, grievous signs of neglect were visible in many of them; and the remark of the wife was common, "My husband has so little time to

attend to the garden." It is only in the spring and summer evenings that a "little time" can be devoted to the garden—too little to do it justice. Many cottage gardens are much too large—altogether beyond the capacities of the tenant to properly till them; and they become, as was too frequently seen on the occasion referred to, deserts of weeds. It is impossible for a labourer to obtain the necessary manure with which to dress a large plot of ground, even if he had the time to do it thoroughly. Some of the best crops were seen where a pig was kept, but a hog-sty was the exception, not the rule. Lessened gardens, and more time to cultivate them with advantage, are requirements in many country districts.

CHAFFEY BROS., LTD.—At a recent meeting of the London Advisory Board of the Australian Irrigation Colonies (CHAFFEY BROTHERS, Limited), consisting of Lord KNUTSFORD, Mr. MITCHELL LENAY, and Mr. J. E. MATTHEW VINCENT, held at the offices, Queen Victoria Street, E.C., Lord KNUTSFORD being in the chair, reports exhibiting the progress of these settlements on the River Murray, in Victoria, South Australia, were presented by the chief commissioner, Mr. J. E. M. VINCENT. The reports were in all respects favourable as regards the growth and increasing productiveness of the fruit orchards generally, the output this year being estimated at several hundred tons, although the plantations are still in their very early stages of remunerativeness. It was mentioned that one planter, Lord RANFOLLY, would consign some 4000 cases of Oranges and Lemons to the English and other markets. It was further stated that arrangements were being made in this country and elsewhere for the formation of several cultivating companies for dealing with blocks of 5000 acres and upwards, with the view of the more rapid development of the settlements in the early future. These companies would engage in the production of oil, wine, brandy, dried fruit, and other staple articles of commerce which can be produced at the irrigation settlements in great abundance and excellence. The work which is being done at the Irrigation Colonies, in the opinion of the chairman, was one of essential value to the future prosperity of Australia. It is confidently believed that, by means of irrigation, the lands bounding the Murray will maintain an immense population, and be productive of enormous wealth to those concerned in the valuable productive industries which are now so successfully established.

FRANKFURT.—Dr. MOENIUS has been appointed Director of the Botanic Garden.

NARCISSUS EXHIBITION IN BIRMINGHAM.—The Council of the Birmingham Botanical Society purposed holding an extensive exhibition of Narcissus in April last, but owing to the season being such an early one, the date fixed upon proved to be too late, and there was but a scanty display of these lovely spring flowers. With a view to still further popularise the Narcissus in the Midland Counties, the Council of the Society have determined to hold another exhibition in their gardens at Edgbaston, Birmingham, on Wednesday and Thursday, April 18 and 19, 1894.

ATHENS.—Dr. SPYRIDON MILIAKARIS has been appointed Professor of Botany in the University of Athens.

SPECIAL PRIZES FOR A DISPLAY OF FLORAL DECORATION have been decided upon by the committee of the great Shrewsbury floral *fête*, in connection with their annual exhibition in August next, as will be seen by their advertisement last week, with a 1st prize of £5, and a 3-guinea Gold Medal for the best display in a space 10 by 4 feet. This will prove an additional attractive feature at this great exhibition.

POT PLANTS.—All gardeners are familiar with the way in which the roots press themselves up against the inside of the pot, away from the soil. It would seem as if those roots so placed could derive relatively little advantage from the soil in the centre of the pot, while at the circumference there is little or no food at all. To overcome this, M. SACS

smears the inside of the pot with a paste composed of 100 parts of gypsum (plaster of Paris), with 1 part each of saltpetre (potassic nitrate), magnesian sulphate, calcic phosphate, and sulphate of iron—all finely powdered, and then mixed into a paste with water. The results are stated to have been very satisfactory.

HYBRIDISATION.—Mr. W. ENGELMANN, Leipzig (WILLIAMS & NORGATE, London), has published a reprint of KÖLREUTER'S account of his experiments and observations on the sexuality of plants published originally in 1761, under the title of *Vorläufige Nachricht von Einigen das Geschlecht der Pflanzen betreffenden Versuchen und Beobachtungen*. FAIRCHILD, a nurseryman of Hoxton was the first to produce a hybrid plant, but KÖLREUTER was the first as SACHS says (*History of Botany*, p. 407), to investigate the question scientifically and thoroughly. As the book is published at the cost of a few shillings, many will be glad to possess a classical book of such importance.

"L'HORTICULTURE FRANÇAISE."—In this handsome treatise, M. CH. BALTET has published the address which he gave at the Trocadero in 1889, on the occasion of the International Exhibition. It deals with the progress of horticulture in France from 1789, and is enriched with portraits and other illustrations. Horticulture owes so much to French genius and enterprise, that many will be glad to read in M. BALTET'S pages a summary account of the salient points in the history of horticulture in France, and brief notices of the leading spirits from ANDRÉ THOUIN, the VILMORINS, and many famous raisers of the past, to DUCHATRE, and NAUDIN, and ALPHAND, in our own times. We have little doubt that, sooner or later, a reprint will be called for, which will afford the opportunity for compiling an index, and perhaps of supplying certain omissions in the enumeration of famous garden-hotanists.

PRODUCTION OF TUBERS WITHIN THE POTATO.—This not unusual occurrence has been investigated by Mr. A. B. RENDLE, who gives his results in the current number of the *Journal of Botany*. He shows that the tubers are formed at the base of a shoot, the upper part of which has been injured or destroyed. The nutritive matter which should have been devoted to the production and growth of the shoot or "chit" is now failing its proper use, devoted to the production of adventitious buds.

COSTA RICA.—MM. DUBAND and PITTIER contribute to the *Bulletin of the Royal Botanical Society of Belgium*, 1892, an account of the Flora of Costa Rica, preceded by an historical sketch, in which the labours of WARSCEWICZ are alluded to. His herbarium is at Berlin, but loses much of its value by reason of the nearly complete absence of indication as to the localities where particular specimens were collected. WENDLAND'S researches are also epitomised.

SISAL HEMP.—Referring to the culture of Sisal Hemp in Havana, it is stated in a recent report that limited attempts have been made to introduce this branch of industry, but up to date no profits have been derived from it, for want of special attention. In and about the port of Nuevitas more than 1800 acres have been planted close to the seashore, of the very best appearance and quality. Now that the plants have attained full growth, there seems to be no doubt but that the industry could be made a thriving one if some capital were invested in proper machinery to obtain the fibre, which is of remarkable strength, length, and whiteness.

ARTISTIC GARDENS IN JAPAN.—The *Studio* for July 15 has an illustrated article on this subject. The general nature of Japanese gardens has often been described and illustrated in these columns, and Mr. JAMES H. VEITCH'S articles on the subject now in course of publication will keep the matter fresh in the reader's mind. Mr. CHARLES HOLME, in the article to which we refer, points out how art is applied to the every-day wants of the people. So far as gardens go, while there is much that our

European taste would condemn, there is much, on the other hand from which we might derive profit, particularly in the arrangement of small gardens. We are not alluding to such childish efforts as the reproduction of Fusi Yama in a bowl or on a tea-tray, but to the skilful disposition of shrubs, the arrangement of color-effects, and the treatment of paths. We commend to the notice of designers who have to deal with the thousands of oblong patches in the suburbs of our great towns, the manner in which the Japanese "glorify their back-yards," to use an expression of the writer before us. The excessive pruning and distortion of trees and shrubs, on the other hand, is a barbarism as bad, or worse, than the cockney's rockwork, and on a par with certain of the ridiculous "ex libris" plates given in the same number of the *Studio*.

ARCHITECTS AND LANDSCAPE GARDENERS.—Readers of the *Gardeners' Chronicle* will remember sundry books, the production of well-known architects, which appeared not long since and held the landscape-gardener and his ways up to ridicule. It was abundantly evident that the architects in question were not competent to act as instructors on matters of landscape-gardening any more than garden-designers, as a class, would be likely to be good house-planners. So far as design goes that requires an artist, and he may be architect, or he may be a gardener. A church recently erected in a western suburb from the plans of one of the scoffers we have alluded to, certainly invites criticism. The west front consists of a huge recessed window, itself finely designed, but propped up on crutches, as if already the foundations had given way. Beneath this window is a ridiculously small doorway such as might be suitable for a vestry-door or a priest's entrance, but unfit for the passage of a large congregation. This door, by the way, is nearly, if not quite the only means of exit, and would be dangerously inadequate in case of accident or panic. Flanking the great window are two tiny embattled towers, quite out of proportion to the building, and up which a well-proportioned bell-ringer might have a difficulty in passing with comfort. Poking through the roof on either side is an arcade extending the whole length of the building, and broken here and there by small pepper-box turrets, useless we imagine except for decorative purposes. The whole building seems to be a travesty of the Gothic of the late Tudor period as it was about to pass into the Renaissance. Those landscape-gardeners who may happen to see it (it is at Ealing) are not likely to feel much distressed at the criticisms of such a designer on productions outside his own specialty.

THE SEASON.—A remarkable illustration of the effect of the season on Roses is cited by Mr. C. J. GRAHAM in the *Gardeners' Magazine*. He states that the number of blooms staged this year at the National Rose Society's show at the Crystal Palace was 4674, as contrasted with 7100 last year. The number, indeed, is more than enough to see comfortably, it is the falling off in quality that is to be regretted.

DOUBLE FLOWERS.—Much has been written concerning the "reason why" of the production of double flowers, and various methods have been described whereby the cultivator may make himself tolerably sure of a certain percentage of the desired form. The occurrence of a few cases to the contrary does not invalidate a general statement, but it is always well to chronicle them for future reference. Accordingly, we note that Messrs. WATKINS, SIMPSON & Co. of the Strand, have kindly forwarded us a Stock, the lower branches of which bear double flowers, whilst the central and upper branches have single flowers only.

WEATHER-PROOF PAINT.—On the northern coasts of Norway, the dwellings and outhouses are coated with paint mixed with cod-liver oil instead of linseed oil, and universally the inhabitants declare that it is better proof against the weather, and carries a more varnished appearance than the latter. The ordinary brown cod-liver oil is purchased for 13 pf. (about 1½d.) per litre, as against

about 55 pf. (= sixpence three and a-half farthings) for linseed oil. A Mr. ENDERLE, in Germany, made an experiment with this oil on a wooden house, the work being carried out during moist, cool weather, at the end of October and beginning of November. For two coats of paint, there were consumed for 2100 square ells of surface, 100 litres of oil. The first coat dried very rapidly into the wood-work, which had been painted the last time fifteen years previously; the second one dried in about one week. The paint used was prepared in the following proportions:—To 120 parts cod-liver oil, there were put 20 parts turpentine, 200 parts white-lead, 13 of yellow-ochre, and 3 of fluid driers. The first coat of paint was made rather more oily than the second. In the fifteen months which have elapsed, the experience of the Norwegians concerning the paint has been supported. *Illustrierte Nützlicher Blätter, Vienna.*

NEW BORDER PICOTEE, LOTTIE KIRLEW.—Mr. G. HOLMES, Haxby Road, York, sends flowers of a very beautiful Picotee, with yellow ground, flaked, and edged with bright rose—not a regular florists' flower, but highly pleasing, all the same. It has much-branched flower-stems, and is vigorous in growth.

JOHNSON'S "GARDENERS' DICTIONARY."—The new edition of this serviceable publication, produced under the superintendence of Mr. C. H. WRIGHT and Mr. DEWAR, is making steady progress. If less ambitious in its aim than some other publications of a similar nature, it has the advantage of being cheaper and more compact, whilst the reputation of the Editors affords a guarantee that the work will be carefully revised and brought up to date. Messrs. BELL & SONS are the publishers.

CLIVEIA MINIATA VAR. MISS ALICE RODIGAS.—A fine variety, raised by M. FORTEL of Ghent, and remarkable for its finely-formed flowers, of an orange colour, overlaid with vermilion, which extends even into the tube, which consequently displays less yellow than usual. *Cliveia miniata*, we are reminded, was introduced by Messrs. LEE of Hammersmith in 1854, since which time much progress has been made, and the flower, in a horticultural sense, greatly improved. The present variety is figured in the *Illustration Horticole*, t. 177.

DAMPING OF CHRYSANTHEMUMS.—A writer in the *Illustration Horticole* gives an accurate account of the phenomenon, and attributes it to various causes, one of which is the indiscreet use of artificial manure, such as sulphate of ammonia. We believe, however, that a fungus is the real source of the mischief, and the ammoniacal manure would be very much to its taste, no doubt.

ERNST ENDER.—The Curator of the Imperial Botanic Garden at St. Petersburg did not long outlive his Director, Dr. VON REBEL. Mr. ENDER, who was in his 56th year, died suddenly on April 16.

CATTLEYA LEOPOLDI.—Mr. BOLL kindly sends us a flower in which the three sepals are in their ordinary condition, and there are three petals—one median in position, but with the coloration peculiar to a lateral petal, and two lateral petals in the guise of lips. The column has three stamens, probably representing one of the outer and two of the inner whorl, thus:—a 1, A 1, a 2, of the Darwinian notation.

CANADA.—Canadian correspondence shows that the Dominion has come out bravely at Chicago—a fact which those who remember the magnificent display she made at the Indo-Colonial Exhibition a few years ago will not be surprised at. The Apple crop this year is likely to be deficient.

"DICTIONNAIRE PRATIQUE D'HORTICULTURE."—This, which is a French translation of NICHOLSON'S *Dictionary of Gardening*, is progressing steadily, its parts being published by O. DOIN, 8, Place de l'Odéon, Paris, and by Messrs. VILMORIN, ANDRIEU & Co. It is not only a translation, but contains much additional matter, and many new illustrations. To those who read French the work will be a great boon.

LADY GARDENERS.—The general aspects of the question relating to gardening by ladies whom circumstances may have bereft of sufficient means to obtain anything beyond bare subsistence, have often been discussed in these columns; and the success of the attempt questioned. At the same time, if those who engage in commercial horticulture have a modicum of Miss HURRIMAN'S gardening expertness, business capacity, and especially her optimism, they could scarcely fail to obtain some addition to their modest incomes. This lady, who engages in gardening pursuits herself, and has several small concerns in Derbyshire, Hertfordshire, and elsewhere, gave a lecture at the Earl's Court Exhibition, on Saturday, July 22, on the way in which a living could be got by a combination of Tomato, Cucumber and Apple growing as the chief industries. As regards the question of co-operation, she would only advise it in the case of tried and trusted friends; but in the case of sisters, or mother and daughters starting such an enterprise, a successful business ought, she said, to "run" easily. The capital required may be from £300 to £500 to cover the expenses of building a cottage and Tomato-house, and of stocking the ground, &c. Half an acre of land is enough, at least as a beginning, and it should be near a high road. All the details respecting the preparation of the soil, planting, and choice of fruit trees were gone into, and the lecturer showed how every bit of the ground could be made use of. It is, however, only in very exceptional cases, in our opinion, that commercial success is likely to be obtained by lady gardeners. These lectures will be continued on Saturday afternoons in the lecture hall at Earl's Court.

MIDDLESBROUGH FLORAL AND INDUSTRIAL SHOW.—The show held at Middlesbrough on Wednesday, July 19, was one of the best that the Society has held; fortunately the weather continued fine, and the show did not end as the shows of 1891 and 1892 did, in disaster. The exhibits were of excellent quality and of a comprehensive character. Compared with former shows in regard to the number and quality of the entries, it exhibits distinct advances, besides the fact that it took eight large marquees to display the exhibits. Altogether there were 2000 entries.

WATER EXCURSION.—A party of about ninety, principally comprised of employes at the Royal Nurseries, Slough, and their wives, had a very pleasant trip up the Thames on Wednesday, July 19.

FIRE AT CHERKLEY COURT.—We greatly regret to announce that on Wednesday last, during a thunderstorm, Cherkley Court, on Leatherhead Downs, the mansion of Mr. ABRAHAM DIXON, was set on fire by lightning, while the family were at lunch. A considerable portion of the mansion was destroyed. The water supply was indifferent. The valuable paintings and other costly articles acquired by Mr. Dixon during his varied and extensive travels were saved by people from the surrounding districts who flocked to the scene.

THE FESTIVAL OF FLOWERS AND LABOUR.—The Sixth National Co-operative Festival will be held on Saturday, August 19, at the Crystal Palace. The Flower Show will probably be as large as ever, notwithstanding the adverse season. The co-partnership exhibition of goods from workshops in which the workers share profits and management, will be extended, as several new and interesting societies will take part. Then there are the children's sports, athletic sports for members of co-operative societies, a contest of choirs; and a new feature, comprising a general muster on the terrace, for short speeches on co-operative subjects.

PUBLICATIONS RECEIVED.—*Relatorio sobre Trabalhos do Jardim Botânico Rio de Janeiro*, por J. BARBOSA RODRIGUES, Director; Report of the Botanic Garden, Rio de Janeiro.—*Vellozia, Contribuções do Museo Botânico do Amazonas*. In this publication, several numbers of which are before us the Director, J. BARBOSA RODRIGUES describes and figures numerous new species of Passifloraceæ, Palms, Orchids, &c., to

some of which we may refer on a future occasion. —*Enumeratio Plantarum in Horto Botanico Fluminense (Rio de Janeiro) cultarum*. Although the establishment has been founded ninety years, it has been treated mainly as a pleasure garden, containing a large number of plants, but of few species, and those not representative nor classified. Now, the Director, M. J. BARBOSA RODRIGUES, enumerates more than 1500 flowering plants, and 151 species of Ferns.—*Tropical Gardening in British Guiana*, by JOHN F. WARY, Demerara. (Argosy Press.)

PLANT PORTRAITS.

CARYODENDRON JANEIENSE (EUPHORBACEÆ), Barb. Rod., *Plantas Novas no Jardim Botânico do Rio de Janeiro*, ii.

COMARUM PALUSTRE, *Mechan's Monthly*, July.

HEMANTHUS COCCINEUS, *Garden*, July 15, with a review of the species from a cultivator's point of view, by "W. W."

RHODOBENDRON HYBRIDUM VICTOR CHAIRON.—A variety with flowers of a rich crimson, with bold foliage. It flowers late. It was raised by M. Fortie, of Ghent. *Illustration Horticole*, t. 178.

SEBENIA PAULENSIS, Barbosa Rodrigues, *Plant. Nov. Jard. Bot. Rio de Janeiro*, ii.

VANDA TRICOLOR WALLICHII, *Revue Horticole*, July 16.

TRING PARK, HERTFORDSHIRE.

[SEE SUPPLEMENTARY ILLUSTRATION.]

As if by magic, the recent rains have caused the gardens and pleasure grounds of the Right Hon. Lord Rothschild, to assume their wonted fresh and bright appearance; indeed, thanks to the unremitting exertions of his gardener, Mr. E. Hill, not even the protracted season of drought through which we have passed, has at any time produced any ill effects beyond the browning of the grass, but the maintenance of the gardens up to anything like their average standard during such a time must necessarily have entailed an enormous amount of labour. Each year fresh improvements are carried out in the gardens, and still the lofty old trees which here assume such an elegant and informal habit of growth, remain untouched, cool shady walks being formed beneath them which serve to link the modern gardens which are here and there arranged; the passage from the natural sylvan glade to the complete and beautiful modern garden being in each case in the nature of an agreeable surprise.

Each of these little gardens is complete in itself; once entered, the whole comes under the eye in an instant, but nothing is seen of the gardens beyond, for each of these separate designs is encircled by an irregular bank, planted with rare Conifers and shrubs, faced with flowering plants, Lilies, and Roses, and in all cases with as many annual or perennial sweet-scented flowering plants as possible.

The first of these beautiful nooks we entered had in the centre a large bed of purple Clematis, trained low, and with the scarlet-flowered Lobelia cardinalis planted among it, their brilliant heads overtopping the purple Clematis. It had a broad edging of Vinca minor. Around the centre, arranged in geometrical order on the verdant lawn, are beds of brilliant scarlet and of yellow-flowered Begonias; of Viola mixed with silver Pelargoniums, and other charming combinations, each bed, as a rule, having but one or two kinds of plants in it, and each has a suitable edging. Around the sides are splendid specimens of Golden Yews and Golden Queen Hollies, grown in standard manner, each being planted in a round bed filled with flowers to harmonise with the general design. The front of the encircling raised shrubbery is planted with Abies pumila, and here and there are fine specimen trees, some of which are historical, and notably the original plant of Cupressus Lawsoniana lutea, which is now over 20 feet in height, of a clear bright yellow, and perfect in shape.

Another of these charming little gardens is planted chiefly with sub-tropical plants, a specimen tree of

some rare species being in the centre of each bed, and having the usual surrounding of fragrant flowers backed by rare Conifers, and flowering shrubs rising high enough to isolate the little retreat. Here Cedrus atlantica glauca, and some of the glaucous Abies assume an almost blue tint; a specimen of Rhus Cotinus is a pretty object; the bushes of Olearia laastii, with snowy-white flowers; and the brilliant yellow of the Golden Yews, of which large numbers are planted with telling effect, and surpassingly beautiful.

Among the beds, the flowering Cannas are handsome in foliage and bright in flower; the early-flowering Dahlias are effective, the old Salvia patens makes beds of the prettiest blue imaginable, and the yellow Marguerites, white Nicotiana, Sweet Peas, and other flowers, are very judiciously placed. At one end is a more formal arrangement of clipped Box and flat-topped Junipers, and beyond, a little golden garden of Cupressus Lawsoniana lutea and other golden variegated trees, with Clematis Jackmanni planted beneath, and a fine bed of crimson Begonias in the centre. Other pretty arrangements are planted at various points, each one a study in itself; and around the mansion are some beds of brilliant Pelargoniums, &c., and everywhere the smooth, short greensward, and hard, well-kept gravel-walks, receive as much attention as the flowers, for nothing must be untidy or out of place at Tring Park; the gardens seem always in holiday garb.

Glancing over the fine expanse of pleasure-ground we note a large number of kangaroos, as well as Emus, and other foreign birds, which are quite at home, and breed freely at Tring Park, where natural history, as well as gardening, finds an enthusiastic patron in the Hon. Walter Rothschild, whose museum in the grounds has now a world-wide reputation.

In the fruit department there are grand crops of Grapes in the vineries. Peaches and Nectarines have given, and are giving, very fine crops. In the open ground, Currants and Gooseberries are reported to have been unusually prolific, and Apples and Pears beyond the average.

Our illustration was prepared from a photograph by Bedford Lemere & Co., 147, Strand.

(To be continued.)

HOME CORRESPONDENCE.

THE SUMMER-PRUNING OF FRUIT TREES.—I do not think that "Extension," under the shelter of an assumed signature, should describe this or that system of summer-pruning, and deliberately write under them. "Now this is the practice ridiculed by Mr. Fish," and again, column a, p. 69, under the experimental trees at Chiswick, "so that Mr. Fish's censure has a pretty wide application." Again, on p. 68, he says, "I am clear enough in condemning 'E. M.'s' description of the usual practice of pinching to 2 or 3 inches or two or three eyes." In the face of these three distinct charges, and there are more of a similar sort on pp. 68, 69, most of your readers will be surprised to learn that, up till now, not a word or line has appeared from me in your columns this year on the length of the cuts, nor of the base-shoots, left after summer-pruning. Unless "Extension's" positive assertions are mere myths, or the laboured nightmares of a midsummer's night dream, they can only be based on my only published criticism of "E. M.'s" system, June 3, p. 667. If Editor and readers will oblige by turning to that page, I offer either of them, or the smartest P.-d. in the office, a sovereign, who can find in that column either a word or a line against "E. M.'s" cuts or their length, so that this charge has no more solid foundation than the censure and the ridicule launched against other systems, and is equally the offspring of "Extension's" fertile imagination. My chief objections to "E. M.'s" views were, that while disparaging summer-pruning, he practised it to excess; to cut in June and July, and again in September, being too much of a good thing for our climate, and also that he limited his prunings to "surplus shoots," whatever those might mean, but not a word from first to last as to the length of his cuts, or the number of eyes left at the base of his summer-pruned shoots. D. T. Fish. [We have had

further communications on the subject from Mr. Fish in support of his contention, but the excessive demands on our space prevent us from giving them a place. Ed.]

— It is refreshing to find Mr. Fish stating a clear and precise issue, and putting it in a nutshell, thus:—"Does or does not summer-pruning augment or accelerate fertility?" Summer-pruning is an elastic phrase used by Mr. Fish now, but holding him to his position, as stated or implied on June 3, I can answer him decisively in this way:—If you plant two Apple, Pear, or stone-fruits under exactly equal conditions, and summer-pinch one and leave the other untouched by the knife, the latter from the first will be by far the more fruitful or productive, and the fruit of it at least equal to the other in every way. But please note, that I deprive both trees of the benefits of root-pruning or root-restriction in any form, because I find wherever I go, that much that is credited to pinching is really due to root-pruning or transplanting, and these practices are acknowledged and common to all systems of fruit culture. Deprive your pincher of this aid, then you have him quite safe, and that is the true way to put his theories to the test. As you put in your leader of June 3, the extensionist provides a safety valve for the "abounding energies" of the tree in his pinched branches, whereas the summer-pincher shuts the valve off and the trees explode—to carry the simile a little further. I say again, cut off his root-pruning and you will soon reduce your pincher to absolute despair when the extensionist will be gathering his fruit. It will be noticed, I dare say, that although summer-pinching is really the subject of dispute, Mr. Fish is constantly bringing in root-pruning in an unobtrusive way, knowing perfectly well, I doubt not, that without it his defence of pinching has not a leg to stand on. The close-pinching system, founded on pure "rule of thumb," has caused more trouble to fruit growers than anything else I know of, and it is not creditable to gardeners or gardening that we should still be wrangling over such a simple problem. *Extension.*

BLACKMORIANA.—A well-known fruiterer told his crowd of customers in Kingston market on Saturday last, that his Apricots were that morning gathered in Hampton Court Gardens, and his Peaches were grown by the celebrated author of *Larry Doony*. We have long been familiar with "flowery rhetoric." Now we hear of the "fruits of literature." D.

FRUIT TREES IN POTS ON THE DINNER TABLE.—These have a somewhat bizarre appearance, but when not of enormous size, they are permissible on large tables. Vines some years ago were so grown, notably by Sage when gardener to Lord Brownlow at Ashridge, Berkhamsted. These plants were arranged on iron stands or trellises, either table or pyramidal in form, and carried from eight to twelve bunches. Oranges, grown on small plants, and ripened in suitable warmth, are very ornamental on the table. Peaches, Cherries, Figs, Pears, and Apples are unsuitable for the purpose, by reason of the size of the pots in which it is necessary to grow them. A. Y. E.

NEW VARIETY OF ACHIMENES LONGIFLORA—The letter of your correspondent ("The Old-un") in the current number of the *Gardeners' Chronicle*, no doubt refers to the Achimenes staged by us at the Chiswick Show. If he had paid a little more attention to the exhibit, he would have seen that we had two varieties of Achimenes longiflora—the old blue major, and a new one, quite distinct, and of a much deeper blue in colour. If your correspondent is fond of Achimenes, we have no doubt he would be much interested in a visit to our houses, where he would see the different varieties growing side by side. *Sutton & Sons.* [Messrs. Sutton kindly send a few blooms of the old and the new varieties, which, on inspection, show a slight difference, the new one having blooms of a slightly deeper tint of blue, and the reverse of the leaves is reddish-brown; whilst in the old variety it is green, which proves the contention of the exhibitors. Ed.]

ANEMONOPSIS MACROPHYLLA.—Can anyone yet tell me—for I asked the question before, three years ago—in what part of England, and in what soil and situation this elegant and remarkable plant does well? It is, I believe, the only species of its genus, and is a native of Japan. It flowers in July on wiry stems, 18 inches high, four or five flowers coming singly on very slender deflexed branches. The pendent pale purple flower is something between a Columbine and an Anemone, but quite distinct from

either. I have grown it for several years, but it never seems quite happy, and the plant disappears after two or three years. I have tried light soil and strong soil, sun and shade, without satisfactory results. It is looking less badly than usual this year, on light raised beds, with an eastern aspect, sheltered by a wall, and kept watered. It ripens a little seed, from which I have two or three times raised about a dozen plants, so that I have not been without material for experiment, but I do not make progress with it. The leaves wither, as if from damp, before the flowers come out, which gives a shabby appearance to what might be one of the choicest of hardy perennials. *C. Wolley Dod, Edge Hall, Malpas.*

POLYGONUM AS FODDER.—I can show a bank 6 feet wide and 150 long, with finer var. of Polygonum than have been growing for some years; some I have cut for my cows, but some are standing, and it will show how they have stood the drought. I am shipping the seed and roots to India for growing on embankments by the side of the rivers and watercourses, for it stops the silt, and prevents the banks being washed away. It is grown on sandhills, near the sea, and if the dry canes are not cut for fuel, they greatly assist in stopping the sand. *Thos. Christy.*

TOMATO DUNEDIN FAVOURITE.—This Tomato, which will, I believe, be sent out by Messrs. Hurst & Son, is in my opinion of great commercial value. Among fifteen varieties which I am growing this season it was the earliest to ripen, and the first fruits were as perfectly symmetrical as those that have followed. This is the result of long-continued and careful selection. The flesh of Dunedin Favourite is peculiarly rich, and it contains but few seeds; a very attractive combination of deep scarlet and crimson with glossy skin distinguishes the fruit. In weight it exceeds other Tomatoes, very solid, and with little or no core. Its level and regular shape is an advantage in packing for market. Some specimens of this Tomato were exhibited on July 11 at the show in the Chiswick Gardens. *W. R., Streatham Hill.*

FLORISTS' FLOWERS.

HEPATICAS.

My pretty Hepaticas lead the way among the spring-flowering plants. Large clumps of the single white and the single blue, growing at the foot of a wall on a west aspect, were cushions of bloom, and it is surprising how well the plants did, although the position is a very warm one in summer, and especially so during a time of drought. When planted, a deep hole was dug, and a foot or so of good loam and leaf-soil placed in it. In pots plunged in a bed of cocoa-nut fibre, the single and double red angulosa and Barlowii were early in bloom. The double blue is always latest in blooming, but it is a beauty when flowered in its best form. But it makes increase very slowly, and appears to be very impatient of division, and these no doubt are the main reasons why it is always scarce and dear. I find the best way is to grow three or four plants on undisturbed for a few years until they have five or six strong crowns; then detach the outer crowns and place round the sides of pots until they are strong enough to admit of being potted singly. I frequently get asked for plants of the Double blue Hepatica with four or six strong crowns, but it is difficult to find them.

How seldom one sees Hepaticas in the open border. They are no doubt frequently planted, but I fear little cared for after being planted, and a hot summer, or a dry and exposed position, results in their being roasted up. I think that if the plants were potted in the deep sort of Hyacinth pots, and the pots plunged in the open border, the plants would stand a better chance of succeeding. I have tried this experiment with other subjects requiring coolness and moisture at the roots during summer, and with decided success. The sides of the pots would help to keep the roots cool, and then the tops will stand a little roasting. They are greatly helped too by some fresh soil being placed around them as soon as they go out of flower, and over this some cocoa-nut fibre.

I regard *H. angulosa* as a very much overrated plant. It is a strong grower, and increases more rapidly than any other, but unless there are fine selections from it that I have not seen, the flowers are pale in colour, and somewhat starchy, and in my own experience not so freely produced as either of the other single-flowered types. It is easily recognised by its very robust habit of growth.

I very rarely get a self-sown seedling from the plants under my wall, though they are very strong. I take the precaution of surfacing the soil round the plants with a fine compost as soon as they have done flowering, so that if any seeds are shed they may have something to assist germination. But the plants plunged in the cocoa-nut fibre bed occasionally give me a few chance seedlings; perhaps the fibre is more favourable to germination than the soil in the border, and in the latter case drought may interfere with the sprouting of the seeds.

It would tend materially to the interest in the Hepatica if a good representation of the leading varieties could be seen at one of the spring meetings of the Royal Horticultural Society. It could be furnished only by those who grow large collections in the neighbourhood of the metropolis. *R. D.*

A TRAVELLER'S NOTES.

(Continued from p. 42.)

Kyoto, May 10, 1892.—On leaving Miyanoshta, I proceeded over the summit of Otome-toge (3300 feet elevation) to Gotemba, a village at the foot of Fuji-yama, chiefly known as the starting-place for those making the ascent from Yokohama. The ascent of Otome-toge, as of other hills I have been up, is particularly steep and fatiguing—scarcely a vestige of a path in some places, what there is, having arisen from the passing to and fro of woodcutters and their pack-horses. In some places the pathway (*Murray* calls it "almost like scaling a wall") ascends sheer and straight, even the pack-horses having to be provided with straw shoes tied around each hoof.

From the summit of Otome-toge, commonly known as the "Maiden's Pass," one of the most complete views possible of the Sacred Mountain is obtained, as well as the fertile plain at its base. The view is extremely fine, Fuji rising in the form of an unbroken snow-capped pyramid right ahead, completely dominating the surrounding chains of hills. Its regular pyramidal form, its great height (13,000 feet), four times as high as any mountain within sight, and, above all, its isolation in the centre of a huge plain, render the sight a most impressive one.

Descending from Otome-toge, with Fuji all the time in view, one passes through grass-covered slopes, which commence some 1500 feet from the summit. The Aster I mentioned in my last letter—which Professor Ito, of Najoya, informs me is *Aster incisus*—was largely represented, springing up on all sides, a few inches above the grass. *Pyrus japonica*, but a few inches high, was also freely flowering. *Pieris (Andromeda) japonica*, though not so fine as round the crater of Ojigoku, was to be seen, and in many places the undulating slopes of the mountain, especially near the summit, were covered with the low-growing "Maus Bambon."

On the plain round Gotemba the vegetation was much richer. Nearly every vacant space was naturally cultivated, chiefly under Barley and Turnip, but the hedges round the homesteads contained many tall and pleasing specimens of Camellias, *Retinospora pisifera*, small *Cryptomerias*, and *Thuopsis dolabrata* was more frequent than I had yet seen it.

Bushes of *Berberis* were covered with yellow buds just bursting, and *Pandelions* were common on all the hedgerows. The amount of water round this village and spread over the plain is at all times great, doubtless at this moment greater on account of the recent heavy rains. All the fields are splendidly and systematically irrigated for the sake of the Rice—a crop which goes on when the Barley comes off—which should be in a few weeks now. The seedling beds of Rice, just a few inches high at present, will be by that time in a fit state for transplanting.

From Gotemba I came through by rail to Njoya, the fourth largest town in Japan—the distance is 217 miles from Yokohama. The line for the most part travels through fertile plains, or over huge

beds of rivers. It is curious in this part how out of all proportion are the beds of rivers to the amount of water they contain. The beds are extremely wide—about a quarter of a mile usually—in one instance nearly a mile, whereas the stream of water is often only a few yards in width, even after the recent heavy rains. That part of the bed one sees is very shallow, only a few feet deep, and invariably composed of sand, broken by stone boulders, and without a trace of any vegetation whatever.

The fertility of the country is surprising, and it nearly all seems to be under Barley. The quantity grown is out of all proportion to any other crop, and it looks in magnificent condition, and is evidently carefully cultivated. Just now the ears are pretty well fully formed, and will soon commence to ripen. It is cultivated in elevated rows like Asparagus, with trenches between, and has just recently been again earthed-up; that is to say, coolies with a long kind of flat spade (often the blade is 18 inches long) walk along each trench, take off a thin spit from the bottom, and lay it on the ridge, close to the stout stiff stems of the Barley. When this crop comes off, as I have said, Rice is put on, being transplanted from seedling beds. Many fields are pink with a low-growing plant, not unlike a Silene in colour—the effect in the distance is pretty. I am led to understand the fields are lying fallow for a season, and have been sown with this plant, *Astragalus lotoides*, useful for no other purpose except manure. The crest of the most celebrated and powerful family of the Shoguns is three Asarum leaves enclosed in a circle, their tips inwards. That of the imperial family is an ideal Chrysanthemum (though in its regularity and symmetry it looks like a perfect florist's Cineraria). The imperial family also frequently use (particularly the Empress) a crest composed of the leaves and flowers of *Paulownia imperialis*, now flowering well, a very beautiful tree.

The great Tokaido route is, for the most part, lined with Pines, some of them fine specimens. Without the castle a row of *Rhus vernicifera*, the Lacquer Plant, is just bursting into leaf; it does not attain a great height apparently.

I made an excursion to Iburi, a village 15 miles out of Najoya, reached by rickshaws over a very bad road—the usual condition of all country roads in Japan. This mode of travelling long distances is most trying, and after several hours every bone in one's body seems to ache. No wonder Europeans rarely ever leave the beaten track, and confine their attention to a few of the big towns.

In this village are several small nurseries, chiefly containing neat rows of variegated Maples, *Sciadopitys*, *Cryptomerias*, *Retinosporas*, *Podocarpus*, &c. *Azalea mollis*, big bushes, were flowering well. Round this part of the country, the sides of the hills are often covered with low-growing *Azaleas*, chiefly a small-flowered brick-red one. Thus massed, they produce a charming effect. It may with truth be said, the *Azaleas* are to Japan what the Heaths are to Europe.

A very pretty plant I saw flowering in one of these nurseries was *Rehmannia glutinosa*; there were several clumps, beneath the shade of a *Cycas*. Though only growing some few inches high, it produces long Scrophulariaceous flowers, of a pleasing purple colour, and about 2 inches long, in sufficient quantity to make the plant distinctly decorative.

In the village is nothing remarkable, except an old Pine, with a straight stem, some 6 feet high, and a flat-trained head covering many square yards; it is most neatly and cleverly trained.

From Otsu I came to Kyoto, via the Temple of Midera, the village of Karasaki, and the mountain Hiei-zan. The temple, not far from Otsu, along the shores of the lake, covers, with its adjacent buildings, a considerable area. Many of these are hidden by the fine groves of *Cryptomerias* and Oaks surrounding the temple. The Maples, chiefly the ordinary palmatum (polymorphum), are also fine, and justly famous.

The village of Karasaki, about 3 miles further along the shores, is nothing but a fishing hamlet, yet celebrated all over Japan for the most curious Pine known. Its height is not great, about 50 feet; the circumference of the trunk at the base is about 20 feet, though at a few feet from the ground, owing to its dividing into three main forks, it is 37 feet. The following dimensions are also given: length of branches from east to west, 240 feet; length of branches from north to south, 288 feet; number of branches, 380.

It is impossible to step out these distances to see if they are even approximately correct, owing to the

numerous supports, both stone pedestals and wood, on which the great main branches rest. There are many dozen forming a whole scaffolding of wooden legs and stone cushions, but nevertheless, I see no reason to doubt them. Old wounds, caused by time and decay have been stopped by plaster; in one instance, a small roof has been erected over a particularly bad spot. A small Humbo shrine stands in front of this tree, which from its great age, has obtained the reputation of sanctity.

Proceeding still further between cultivated fields on the one hand, and the blue waters of the great lake on the other, the foot of Hiei-zan is soon reached, and then commences as toilsome and as steep a four-mile climb as one can well wish for. I am not surprised at the Japs considering it a pilgrimage to ascend some of these mountains. *James H. Veitch.*

(To be continued.)

SOCIETIES.

ROYAL HORTICULTURAL.

JULY 26.—The show held in the Drill Hall, James Street, Westminster, on Tuesday last, was not by any means so large, or so well attended, as usual, but there were many plants of interest, and a good collection of fruit from amateurs and nurserymen.

Floral Committee.

Present: W. Marshall, Esq., in the Chair; and Messrs. C. T. Drury, H. B. May, H. Herbat, David W. Thompson, R. Dean, O. Thomas, G. Stevens, C. F. Bause, C. J. Salter, H. Cannell, J. D. Pawle, W. Bennett Peck, C. E. Shea, T. W. Girdlestone, C. E. Pearson, T. Baines, G. Gordon, and H. H. D'Ombrian.

Messrs. John Laing & Son, Forest Hill, London, S.E., staged a miscellaneous group of stove and greenhouse plants, including some fine *Caladiums* and *Begonias*, also a plant in flower of *Caragasta cardioalis*, and some *Disa grandiflora*. *Caladium Le Nain Rouge* is one of the small-leaved type, a very colour (Award of Merit). *Begonia Mrs. Joseph*, also given an Award of Merit, is a large double variety, flowers red (Silver Flora Medal).

A collection of Sweet Peas was brought by Mr. Henry Eckford, Wem, Salop. Most of the best varieties were there, and a few seedlings from this well-known raiser were granted Awards of Merit. These were the following: *The Belle*, a pretty mottled Rose variety; *Eliza Eckford*, white, with a little pink, very attractive. A number of Pansy and *Viola* blooms also accompanied this exhibit (Silver Banksian Medal).

Messrs. H. Cannell & Sons, Swanley, Kent, staged a group of *Begonias*, cultivated from seed sown as late as last February. The plants were good, and carried large double flowers. Also a number of plants of *Begonia Octavia*, that pretty double white *Begonia* of nice dwarf habit (Silver Banksian Medal).

From Messrs. Paul & Son, The Old Nurseries, Chesham, came a few hardy flowers, also a plant of *Clematis viticella* var. *Kermesina*. The flowers of this section are small, and this variety is a shade of violet-rose.

Amongst some hardy plants from the same firm was one of a *Campanula Mariesii* (Awarded a First-class Certificate) This is a dwarf plant, with erect habit, about 4 inches high as shown. The flowers are about 3 inches across, terminal, and of a pretty blue, with a narrow band in each segment of darker hue, pistil light blue. Leaves are small, rather stiff and serrated, light green, produced in threes, in shape lanceolate-ovate. Mode of extension by rhizomes or underground runners.

Amongst some plants exhibited by Messrs. Jas. Veitch & Son, Chelsea, were plants of *Cupressus Lawsoniana versicolor*, and *Retinospora squarrosa sulphurea*. The former has slight white variegation, and the latter has but faint variegation of yellow. Also the following:—*Rhododendron* var. *Sylvia*, one of the smaller-flowered varieties raised by the firm—a very lovely yellow. Plants of *Lantana Drap d'Or*, not more than 6 inches high, but blooming very freely; it is a good yellow variety. *Didymocarpus lacunosa* was awarded a Botanical Certificate; the species are from tropical Asia, and produce flowers very like those of *Streptocarpus*. This one has flowers of violet-purple—a stemless herb. (See p. 120.)

Messrs. E. D. Shuttleworth & Co., Peckham Rise, and Fleet, Hants, had a group of *Crotons* arranged with Ferns, included were large, well-coloured plants of *C. Hawkerii* and *C. Queen Victoria*. Amongst

the smaller plants were those of *C. Countess*, *C. acunbæfolius*, *C. Lady Zetland*, &c. (Silver Banksian Medal).

J. T. Hopwood, Esq., Ketton Hall, Stamford (gr., Mr. W. H. Divers), showed a collection of border Carnations, Ketton Rose, a very fine variety of that colour (Bronze Banksian Medal).

Mrs. Darwin, The Grove, Huntingdon Road, Cambridge, showed a plant of *Begonia Mrs. Bourne*, one of the tuberous-rooted varieties, with large single yellow flowers of very great substance. The stem of the plant shown was fasciated, and some of the petals of most of the flowers were modified into leaves.

Mr. Anthony Waterer, Knop Hill Nursery, near Woking, again showed sprays of the variety of *Spiræa Bumalda*, var. *Anthony Waterer*; it is a fine deep crimson colour, and was given a First-class Certificate.

Mr. Fred. Bull, Wormingford, Colchester, had some Carnation seedlings—*Divea*, a scarlet self of fair quality; and *Esmeralda*, a large yellow ground, with lilac flakes (Award of Merit).

Messrs. Dickson & Co., Chester, showed a plant of *Cupressus macrocarpa lutea*; it was of very slender and rather loose habit. Nearly the whole of the needles were light yellow. The specimen shown had probably been taken from a greenhouse (First-class Certificate).

Two plants of *Humulus japonica variegatus* were sent from M. F. Roemer, Quedlinburg. The variegation was very general. Messrs. F. Sander & Co., St. Albans, had a very fine plant of the new *Strobilanthes Dyerianus*, which was first shown at the Ghent show, and then described and figured in our columns.

Mr. P. McArthur, Maida Vale Nursery, staged a good group of miscellaneous plants, including a few Orchids, *Crotons*, Ferns, Palms, &c.; also three plants in flower of *Eucomis undulata* (Bronze Banksian Medal). Some bunches of *Carnation La Villette* were from Mr. E. Domaille, La Colombille, Guernsey.

Orchid Committee.

Present: H. J. Veitch, Esq., in the chair; and Messrs. Jas. O'Brien (Sec.), Dr. M. T. Masters, F.R.S., Thos. Statter, H. Ballantine, T. W. Bond, E. Hill, A. H. Smea, and H. M. Pollett.

Messrs. B. S. Williams & Son, Victoria and Paradise Nursery, Upper Holloway, N., staged a very effective group of Orchids, in which were good specimens of *Anguloa Ruckeri sanguinea*, *Epidendrum Imperator*, *Cattleya Acklandæ*, *C. gigas*, *Oncidium Gardneri*, *O. litum*, *Pascatorea Dayana*, *Paphinia cristata grandis*, *Trichocentrum tigrinum*, *Platyclinis filiformis*, *Cypripedium* × *Morganie*, *C. × orphanum*, and others; *Miltonia vexillaria Cobbiana*, *M. Roezlii*, and various fine species of *Odontoglossums* (Silver Banksian Medal). Messrs. F. Sander & Co., St. Albans, also had a group of rare Orchids, comprising fine plants of the beautiful *Aërides Sanderianum*, *Habenaria militaris*, *Cypripedium* × *Massaianum* (superciliare ♂, *Rothschildianum* ♀), *C. × Fausianum* (*Dauthieri* ♀, *calophyllum superbum* ♂), *C. × Youngianum*, *C. × Venus* (albansæ ♀, *reticulatum* ♂), *Mormodes citrinum*, *Cattleya Batalini*, *Miltonia Roezlii alba*, *Zygopetalum* (*Promenæa*) *citrinum*, *Dendrobium transparens*, &c. (Silver Banksian Medal).

T. B. Haywood, Esq., Woodhatch, Reigate (gr., Mr. Salter), showed by far the best Orchid of the meeting in a grand spike of the large pure white *Miltonia vexillaria* "Daisy Haywood," the largest and best white form of the genus (First-class Certificate).

Thos. Statter, Esq., Stand Hall, Whitefield, Manchester (gr., Mr. R. Johnson), showed a small collection of cut spikes of grandly-grown *Cattleyas* and *Lælias*, for which a Cultural Commendation was awarded. They consisted of *Lælia elegans prasiata*, *L. e. superbiens*, *L. crispata superba*—a noble form (First-class Certificate); two varieties of *C. Rex*, *Lælia* × *Amesiana*, and a plant of *Vanda lamellata*.

Messrs. Pitcher & Manda, the United States Nurseries, Hextable, Swanley, Kent, showed *Sobralia macrantha Princess May*, a delicately-tinted form, with white sepals and petals, and pale yellow lip, the front portion tinged with lavender; and *Cypripedium* × *Edwardii* (*Fairrieanum* × *superbiens*), a charming hybrid, as all hybrids of *C. Fairrieanum* always are. The upper sepal was white, with numerous purple lines branching into each other; petals white, tinged with green on the upper edge, and profusely spotted with purple; lip greenish-white, tinged lilac (Award of Merit).

H. Tate, Esq., Jr., Allerton Beeches, near Liverpool (gr., Mr. J. Edwards), sent flowers of his beautiful and richly-tinted *Cattleya Hardyana*, Tate's var., which received an Award of Merit; and *Cypripedium* × *Tryonianum* (*Harrisianum* × *superbiens*). W. R. Lee, Esq., Bach Lawn, Audenshaw, near Manchester, showed *Cattleya Gaskelliana*, Audenshaw var., very fine in form and colour. Messrs. W. L. Lewis & Co., Chase Side, Southgate, N., sent *Cattleya Warscewiczii*, Turnbull's var., with large light-coloured flowers of a pale rose hue, the lip mottled with a slightly darker tint than the petals—a very singular form; and a flower of their form of *C. Dowiana*, in which the petals are tipped with crimson; and T. A. Gledstanes, Esq., Manor House, Gunnersbury (gr., Mr. H. Denison), showed three fine plants of *Cattleya superba splendens*, which had been successfully cultivated in a warm sunny house for some years, the plants blooming magnificently, as a rule, twice a year. A Cultural Commendation was justly awarded.

Fruit Committee.

Present: T. Francis Rivers, Esq., in the chair; and Messrs. W. Wilks, G. Bunyard, J. Cheal, W. Warren, A. Dan, G. Woodward, W. H. Divers, G. Wythes, G. Reynolds, F. Q. Lane, H. Balderson, and J. Smith.

A box of well-coloured fruits of Peaches and Nectarines came from J. T. Hootwood, Esq., Ketton Hall, Stamford (gr., Mr. W. H. Divers). Peaches were *Crèmeon Galande* and *Dagmar*; the Nectarine, *Lord Napier*.

From Roger Leigh, Esq., Barham Court, Maidstone (gr., Mr. Geo. Woodward) came a dish of *Alexander* Peach, from an east wall; they were of good size, and high colour; also a dish of large Nectarines *Lord Napier*, from a standard tree in an unheated house. A *Smooth Cayenne* Pineapple, weighing 5 lb. 12 oz., produced by an unrooted sucker planted September 15, 1892, was shown by Mr. Owen Thomas, Royal Gardens, Windsor.

Messrs. Geo. Bunyard & Co., Maidstone, had a very nice collection of Apples, the quality of which was very good, noticeable were *Lady Sudeley*, *Quarrenden*, *Duchess of Oldenburg*, *Stirling Castle*, *Lord Suffield*, *Sugar Loaf*, *Lord Grosvenor*, *Beauty of Bath*, *Grenadier*, and *Peter the Great* (*Silver Knightian Medal*). Also a collection of Apricots in seven varieties from the cool orchard-house.

Another collection of handsome fruits was from Messrs. T. F. Rivers & Co., Sawbridgeworth. These were *Pears Souvenir du Congrès* and *Louise Bonne of Jersey*, Apples *Ribston Pippin*, Nectarines *Lord Napier* and *Dryden*, Apricots *Grosse Pêche* and *Mexican*; Plums, *Early Transparent Gage*, *Late Transparent Gage*, and *Monarch*; Cherries *Bigarreau*, *Empress Frances*, and *Géant d'Edelfinger* (*Silver Knightian Medal*).

Lord Foley, *Ruxley Lodge*, Esher (gr., Mr. J. W. Miller), showed dishes of large Peaches, *Grosse Mignonne*, *Royal George*, *Alexander*, and *Noblesse*, the latter not quite ripe (*Cultural Commendation*).

An Award of Merit was given to a seedling Melon, called *Lee's Perfection*, exhibited by F. Lee, Esq., Lynford Hall, Mundford, Norfolk, a yellow, medium-sized fruit, and white, deep flesh; flavour good, rather sharp. Others were from Mr. J. Rodbourn, Haling Park, Croydon, who had *Croydon Hero*, and *Rodbourn's Green-flesh*.

From the Society's Gardens at Chiswick came nine dishes of Apricots grown in the open. They were *Turkey*, *Hemskirk*, *Grosse Pêche*, *Moor Park*, *Kaisha*, *St. Ambrose*, *Royal George*, *Shipley's Early*, and *Breda*, a very small variety. Also a collection of Tomatos in thirty-four varieties, including about eight yellow varieties, and the very distinct peach-yellow *Ponderosa* was the largest shown. Mr. J. Smith, Mentmore, sent six dishes of Apricots; his *Hemskirk*, *Moor Park*, and *Turkey* were very good (*Vote of Thanks*).

Mr. O. Thomas, gr. to Her Majesty at the Royal Gardens, Frogmore, showed dishes of Apricot *Moor Park*, *Powell's Late*, *Shipley*, and *Frogmore Early*, all good. The Duke of Northumberland, Syon House, Brentford (gr., Mr. Wythes), showed eighteen fruits of the new Melon raised by him, and certificated last October, called *Beauty of Syon*. It has rather small fruits, in some cases well netted, has a thin skin, and is of good flavour; also four boxes of Morello Cherries and six of Apricots, in six varieties (*Bronze Medal*). S. G. Lutwyche, Esq., Oakfield, Eden Park, Beckenham (gr., Mr. J. May), had a box of *Tomato Perfection*, very fine, smooth, heavy fruits (*Cultural Commenda-*

tion). A very slightly-made small fruit-basket, to hold about a pound, with a wire handle over top, exhibited by Messrs. Cooper, Denison, & Walkden, 7 and 9, Bride Street, E.C., was Commended.

Lecture.

ON HOUSES FOR ALPINE PLANTS.

Mr. H. Selge Leonard, in commencing his lecture on this subject, said that by alpine plants he meant mountainous plants in temperate climates, but the word had been often used to include many that are dwarf in habit, but not at all identical in their origin or in their requirements to the true alpine. On the other hand, there were some that are not exactly alpine in their origin, but whose requirements in respect to culture and climate were but little different to those strictly alpine, and which in a subject of this kind might be included. The lecturer said that there often arose the question, How far is artificial protection needed by this family, and how much are they benefited by it? He might answer those questions by saying that in his opinion it was essential to come and desirable to many. Mr. Leonard then explained that protection was not needed so much from frost, as from the wet during autumn and winter, and the east winds prevalent in spring, and then referred to the different methods of protection that had been adopted. The handlight was very favourable from many points of view, but its worst characteristic was that the rain from the top of the light was all poured on the ground immediately surrounding the exterior. Sloping glass for individual plants, the system of collecting those that generally need protection, and planting them together in an ordinary part of the rockery, and then covered with sloping lights, unheated frames and pits were all discussed, and the lecturer thought that one was best in some cases, the other in others, but not any system was equal to the alpine-house, which could be visited without inconvenience, and offered shelter to those who, in any weather, wished to look at them, and also offered means of procuring a dryer winter atmosphere or condition. It could be ventilated better by means of bottom ventilation, and it could be made bright throughout the year by having some of the plants in pots, and by growing these in frames during the time protection is needed. The house should have a moveable roof, and must be constructed so that drip is prevented. A large amount of air must always be available, the house should never be entirely closed, indeed, it need not quite meet at the top, but a space be left unglazed over the centre path, and the plants should be placed very near to the glass. Apart from these special requirements, ordinary houses that are used for growing *Auriculas* would answer the purpose. The roof could be removed during late spring, summer, and early autumn. The houses should run from north to south, and the plants could be shaded very thinly during extremely hot weather. In regard to the arrangement of the plants, the lecturer thought that there was much to be said in favour of planting them out, but if some were kept in pots, they are most under control, and they can be moved outside when required, and suitable soil accorded to each of them.

Mr. Leonard had written a list of plants suitable for the alpine-house, but this, which was not read at the meeting, will be published in the *Society's Journal*.

Mr. Geo. Paul, who was in the chair, said he did not like to take any plant under protection if it would succeed equally well outside, but he thought that Mr. Leonard had made out his case, and that some of the alpine were the better for protection from the wet autumn, and cold, damp atmosphere of winter.

THE DEVON AND EXETER GARDENERS' ASSOCIATION.

July 12.—The annual summer excursion of the above includes, besides the Englishman's dinner, visits to several gardens of note, of which flowery and fruity Devon boasts so many. There is no doubt that these annual and social gatherings do very much towards the success which has attended the Society since its formation, and account for the promise of a useful session next season. It was arranged for the members to meet at *Streatham Hall*, the residence of Mrs. Thornton West, Exeter, when Mr. Franklin, the head gardener, undertook to pilot them through the grounds and the numerous houses under his charge; notably the *Palm-house*, a recent erection, a description of which was given in these pages recently. I will only say that it

reflected great credit on Messrs. Veitch & Sons, of Exeter, who built the rockwork and arranged the whole of the interior, no less than on Mr. Franklin, for the skill and good culture which have been brought to bear on the plants with which it is filled; the *Palms*, *Tree Ferns*, and everything besides, were in perfect health, and showed much vigour. The *vineries*, *pinery*, *peacheries*, and *Orchid-houses*, the huge plant-stove (containing a vast number of specimens in great variety), and exotic fernery, and other plant and fruit-houses, all exhibited the head gardener's cultural abilities. The grounds, which are marred only by the numerous angles of the slopes and the terraces, are well kept, showing admirably-used and liberal expenditure of money, now, alas! so often lacking in fine old gardens. The *Coniferae* are numerous, varied, and give promise of making handsome specimens.

The party subsequently proceeded to *Killerton*, the seat of Sir Thomas Acland, Bart., M.P., a distance of eight miles. Through the fertile valley of the Exe, the route lay between splendid fields of golden *Wheat* and bearded *Barley*, orchards laden with *Apples* and *Pears* on each side of the road, the recent glorious rains having vastly changed the appearance of the crops that in this fertile part of the county one would scarcely think there had been a long period of drought. Onward through narrow roads arched with lofty *Elms* and other trees, all tokens of good soil, till *Killerton* was reached. Mr. Garland, the well-known gardener, who was on the look-out for the party, took the party through the flower garden, which was ablaze with colour. A corridor running the whole length of it on one side was filled with a good selection of flowering plants, with *creepers* and *Fuchsias*, *Bougainvilleas*, *Plumbagos* covering the roof. Sir Thomas and Lady Acland kindly invited the company to view the picture-gallery, which contained many beautiful specimens of the art of Sir Joshua Reynolds, notably among them many of the ancestors of the Acland family. The visitors then partook of refreshments, provided by Sir Thomas. The company then further explored the grounds, under Mr. Garland's conduct, which, with art and Nature most artfully combined, make a lovely whole. Trailing on large *Rhododendrons* and *Kalmias* were long festoons and wreaths of the crimson flowers of *Tropaeolum speciosum*. The *Rhus Cotinus* exhibited a rare effect by its spreading branches intermixed with other shrubs. The grounds abound with fine specimens of noble *Conifers*, hardly excelled elsewhere. The *Deodar Glen* was a grand sight with a large number of *Deodar Cedars* on each side, coning most abundantly. The vegetable garden is in admirable order, a row of *Tender-and-True Bean*, the new running variety of the Canadian *Wonder Dwarf*, fruiting most abundantly.

After leaving *Killerton*, a two hours' drive took the party to *Escott*, Sir J. Kennaway's seat. The visitors were conducted round the place by Mr. Anderson, the head gardener. Many choice specimen trees of *Coniferae* were also to be seen. *Bambusa Metake* flourishes most luxuriantly here, and the plants were raised on the place from seed many years ago. The plants afford sufficient stakes for all purposes in the plant-houses. The kitchen garden was found in excellent order. Crops of *Apples*, *Pears*, *Peaches*, and *Nectarines*, abundant and fine; the *Vines* were carrying excellent crops, and the trees in the *Peach-houses* were laden with promising crops, everything betokening good culture. The excursion from first to last was a very enjoyable one.

THE CARNATION AND PICOTEE EXHIBITION AT OXFORD.

July 18.—The annual exhibition in Mr. Dodwell's gardens took place on the 18th inst., but the extreme heat and drought had put many of the Southern growers out of competition.

In the class for twelve *Carnations*, 1st, Mr. Tom Lord, *Todmorden*, with a capital stand of flowers, *Bruce Findlay*, *Duke of York*, a new and fine scarlet bizarre; *Master Fred* and *Gordon Lewis*, being very fine in this stand; 2nd, J. Whitham, *Hilden Bridge*, *Master Fred*, *Joe Edwards*, and *Admiral Curzon*, very fine in this stand; 3rd, Mr. Robert Sydenham.

In the class for six *Carnations*, 1st, Mr. J. Edwards, *Manchester*, *Master Fred* and *Chaundy's Guardman* being in this stand; 2nd, Mr. E. Shaw, *Manchester*, with a very fine *Robert Houllgrave* in this stand; five other prizes following.

For twelve white-ground *Picotées*, there was an unusually fine lot of exhibits with eleven stands in close competition, and some of our leading Northern

growers declared it to be the finest lot they ever saw. Messrs. Thomson & Co., Birmingham, were 1st with a fresh-looking bright lot of flowers, Mrs. Sharp, Amelia, Nellie, Little Phil, and Lady Louise, being especially fine; 2nd, Mr. Robert Sydenham, and in this stand we noticed Lakin's Ne Plus Ultra, new, as being very fine; and 3rd, Mr. T. Whitham, and eight other prizes awarded.

In the class for twelve selfs, fancies, or yellow-ground flowers: 1st, Mr. R. Sydenham, with an excellent lot of blooms, A. W. Jones, Janira, and Robert Sydenham being striking flowers in this stand. 2nd, Messrs. Thomson & Co., Negroes, King of Purplea and Von Beningra being especially fine. 3rd, Mr. George Chaundy, Oxford; with five other prizes following.

In the class for six white ground Picotees: 1st, Mr. A. W. Jones, Birmingham; 2nd, Mr. J. P. Sharp, Birmingham, with four other prizes following.

Other classes were well filled; and in the single specimen classes, the prizes were:—

Scarlet bizarrea: 1st, Mr. Whitham, with Robert Houlgrave; 2nd, 3rd, and 4th, Mr. Tom Lord, with Admiral Curzon and two blooms of Duke of York; 5th, Mr. Phillips, with Robert Houlgrave.

Crimson bizarrea: 1st, Mr. Whitham, with Master Fred; 2nd and 3rd, Mr. Robert Sydenham, with Master Fred and J. D. Hextall; 4th and 5th, Mr. Lord, with Thaddeus and J. D. Hextall.

Pink and purple bizarrea: 1st, Mr. Lord, with Bruce Findlay; 2nd and 3rd, Mr. Lord, with Arline.

Purple flakes: 1st and 3rd, Mr. T. Lord, with Mayor of Nottingham; 2nd, Mr. R. Sydenham, with Chas. Henwood.

Scarlet flakes: 1st, Mr. G. Chandy, with William Dean; and 2nd, Messrs. Thomson & Co., with J. P. Sharp, a fine seedling.

Rose flakes: 1st, Mr. W. Read, Oxford, with a seedling; 2nd and 3rd, Mr. T. Lord, with Sybil and Thalia.

Heavy edge Picotees: 1st, Mr. A. R. Brown, with Little Phil; and 2nd, Mr. R. Sydenham, with Polly Brazil.

Medium edge Picotee: 1st, Messrs. Thomson, with Zerlina; and 2nd, Mr. Sydenham, with Mrs. Payne.

Light edge Picotee: 1st and 3rd, Mr. Jones, with Elizabeth and Mrs. Gorton; 2nd, Mr. Brown, with Thos. Williams.

Selfs: 1st, Mr. A. W. Jones, with Germania; 2nd, Mr. Chaundy, with a seedling.

Fancies: 1st and 2nd, Mr. Dodwell, with seedlings. Yellow Grounds: 1st, Mr. W. Spencer, Jr., Birmingham, with Mr. Robert Sydenham; and 2nd, Mr. A. W. Jones, with Stadrath Bail. Premier Carnation, Master Fred, exhibited by Mr. Lord; Premier Picotee, Little Phil, exhibited by Mr. Whitham; Premier yellow ground, Mrs. Robert Sydenham, a bloom of the finest quality, exhibited by Mr. Wm. Spencer, Birmingham; Premier self, Germania, exhibited by Mr. A. W. Jones.

BRISTOL AND WEST OF ENGLAND CARNATION AND PICOTEE SHOW.

JULY 19.—This new Society held its first exhibition in the Clifton Zoological Gardens on the above date, but owing to the very early season, and the Carnation shows running so close to each other, there were not many collections present. For twelve Carnations, Mr. A. R. Brown, Birmingham, was 1st; Mr. F. Hooper, Bath, 2nd. For six Carnations, 1st, Mr. Dowell, Chew Magna, Bristol. For twelve Picotees, 1st, Mr. Chas. Turner, Slough; 2nd, Mr. A. R. Brown. For six Picotees, 1st, Mr. F. W. Baker, Bristol. For twelve yellow ground Picotees, 1st, Mr. Chas. Turner; 2nd, Mr. A. R. Brown. For six yellow grounds, 1st, Rev. G. R. Brown, Iron Acton, Bristol; 2nd, Mr. F. W. Baker, Keynsham, Bristol. For twelve selfs or fancies, 1st, Mr. C. Turner, Slough; 2nd, Mr. A. R. Brown.

The Charles Turner Medal, for twelve selfs, was won by Mr. A. R. Brown, and the premier Carnation was Admiral Curzon; premier Picotee, Thomas Williams; and premier yellow ground, Mrs. Robt. Sydenham. A First-class Certificate was awarded to Mr. Ambrose, gr. to F. R. Rubinson, Esq., Sneyd Park, Bristol, for a very fine pure white Tree Carnation, named Blagdon Surprise.

NEWCASTLE-ON-TYNE, Great Summer Show.

JULY 20, 21, AND 22.—This year the annual exhibition has been held in July, instead of August, and in connection with the Northumberland Agricultural

Society, whose meeting has been held at this town. In this arrangement the executive of both societies are to be congratulated, and we should think that the gain has been mutual.

PLANTS.

The plant classes were well filled, both those for flowering plants and for fine foliage. For eight plants in bloom, Mr. Letts, gr. to the Marquis of Zetland, Aske Gardens, was a grand 1st with an even lot, all of which were in fine condition; these were Erica Candulleana (extra), E. effusa, Dipladenia amabilis, D. boliviensis (both very fine), Anthurium Scherzerianum, in two distinct forms; Allamanda nobilis, and A. Hendersoni. Mr. Morris of Park Road, Felling, was 2nd, his best being Ivora Pilgrimi, in profuse flower; a smaller plant of I. salicifolia, and a good Statice profusa.

With six plants, Mr. Nicholas, the Marquis of Zetland's gardener at Upleatham, was easily 1st, his plants being as fine as those from Aske; Erica Austriana (highly coloured), E. Shannoni, Statice profusa, Stephanotis floribunda, Dipladenia boliviensis, and Allamanda nobilis, being the selection.

In the amateur class for three plants, Mr. Liddle, Fellingate, showed well, and took the 1st prize.

For four Ericas, Mr. Nicholas was 1st, with healthy plants of medium size, but bright and free; these were Ne plus Ultra, annula, Austriana, and retorta major.

Fuchsias were shown extremely well, the plants being profusely flowered. Mr. Russell, Felling-on-Tyne, being 1st in two classes, and Mr. Bell, High Felling, in another. For eight foliage plants, Mr. Letts was 1st with large examples of good culture, Croton angustifolius and C. Queen Victoria, both being highly coloured, and Cycas circinalis, Dionedule, Dasyllirion acrotrichum and Kentia Forsteriana, each alike good. Mr. J. Smith, gr. to Theo. Lange, Esq., Gateshead, was 2nd, with plants equally as large, but which lacked colour. Phoenix rupicola and an extra good Kentia Forsteriana were the best of these. In the class for six plants with fine foliage, Mr. Nicholas again stood 1st, his best being Croton angustifolius and C. Johannis, with a fine Dasyllirion acrotrichum. W. McIntyre, gr. to Mrs. G. Pease, Darlington, was in this class an extremely close 2nd, there being but little to choose between the two lots. His best were Croton angustifolius, and Cycas revoluta.

With three Crotons, Mr. Letts was 1st, the plants dwarf and finely coloured, C. Thompsoni and C. aigburthiensis being the best; Mr. McIntyre followed. For three Dracenas, Mr. Wm. Stewart, gr. to Sir W. Lawson, Carlisle, was 1st, with D. Mooreana, D. Youngii and D. Shepherdi. Mr. McIntyre following again very closely.

The Fern classes were also well filled. In the open class for six, Mr. Nicholas was 1st, with remarkably fresh examples, some of which are rarely seen in a show; these were Sadleria cyathoides, a noble Tree Fern, and Lomaria zamiaefolia, with Leucostegia immersa, Davallia tenuifolia Veitchiana (extra fine), D. filijensis plumosa, and Gleichenia Mendeli. Mr. McIntyre followed with smaller plants in this class, but took 1st in the amateurs' class for six, with Davallia filijensis, D. tenuifolia Veitchiana, and other good plants, in this class being followed by Mr. Smith.

Table plants were of good useful size, and bright in colour. Mr. McIndoe, gr. to Sir J. W. Pease, Hutton Hall, was 1st in the open class, and Mr. Stewart in the amateurs. The pots in all of the exhibits in these classes were covered with ornamental but suitable pot-covers, thus enhancing the effect as a whole.

CUT FLOWERS.

These were throughout finer than at any show in the south this year, the season being favourable to the northern growers. Messrs. Harkness & Sons were 1st for forty-eight Roses, with a grand lot of blooms, very fresh and bright in colour, H.P.'s predominating, the best being Duc de Rohan, Harrison Weir, Emille Hausberg, Avocat Davivier, Madame Hansmann, Marie Baumann, Comte de Raimbaud, and Duke of Pife, the latter a distinct dark kind, with a violet shading. Messrs. D. & W. Croll, Dundee, were 2nd, with rather smaller flowers, but well set up. In the next class, for thirty-six kinds, Messrs. Harkness still maintained 1st position.

For twelve yellow Roses, Mr. D. Robertson, Helensburgh, N.B., was 1st, with bright flowers of Francisca Kruger; and Messrs. Croll 2nd, with Marie Van Houthe.

For twelve of one sort, any variety, Mr. H. May, Bedale, was 1st, with very fine blooms of Alfred

Colomb; and Mesara. Croll 2nd, with Merveille de Lyon.

For twelve Tea-scented, Messrs. Croll were deservedly 1st, their finest being Devoniensis, Madame Lombard, and Madame Hoste; Messrs. J. Cocker & Sons, Aberdeen, were 2nd.

Messrs. Harkness & Son were 1st with eighteen kinds of hardy herbaceous and border flowers, showing the best kinds in season, and in large bunches; Mr. T. Battenby, Blaydon, being a very near 2nd, his flowers being too much crowded to be seen to advantage.

Pansies were quite a feature, the finest being in the fancy class for twenty-four blooms, in which Mr. Bailey, Jun., Sunderland, was 1st, staging some of the finest blooms seen this year at any show.

The best twenty-four show varieties came from Mr. Proudlock, Holywell.

Carnations and Picotees were quite up to the standard of the National Society. Mr. T. Flowdy, Sunderland Street, Gateshead, had the finest Carnations, and also the best Picotee in the larger classes, both exhibits being first-class.

For a box of twelve kinds of exotic cut flowers, Mr. Nicholas was a good 1st, with choice kinds, Ericas, Orchids, and Lapagerias all being prominent. In a smaller class Mr. McIndoe was 1st, with larger bunches.

Floral arrangements are always an important feature at Newcastle, and at no show this season, North or South, have we seen such a fine display, with such a keen competition as on this occasion.

In the open classes, Mr. Morris, Felling, was 1st for a single epergne, with a light and tasteful arrangement of good proportions; Mr. Edmondson, Green Market, Newcastle, following with a somewhat bolder vase, and a lightly arranged basket. Mr. Robertson was 1st, Orchids, Pancratiums, and light-coloured foliage of Asparagus plumosus predominating; Mr. Jennings coming 2nd with a heavier design, in which Cattleya blooms was the important feature. The 1st prize for a bridal bouquet went to Mr. Robertson also. Mr. Edmondson followed. Mr. Jennings was 1st for a hand bouquet, with a beautiful example, pale colours predominating therein. Mr. Thos. Battenby had the best ladies' spray, and also the best button-hole.

In the amateur classes the arrangements were equally good, the best epergne being that arranged by Miss Edmondson. The lady being equally successful with a basket arrangement, and with a hand bouquet. Mr. T. Battenby was 1st for bridal bouquet in this division with a free design.

FRUIT.

The competition in the sixteen classes was all that could be desired, the best features being the Grapes and the collections. Mr. McIndoe, was 1st for eight dishes, with a strong lot, Muscats and Black Hamburg Grapes, Smooth Cayenne Pine, Beurré Superfin Pears, Bietigheimer Red Apples (extra fine), and Pitmaston Orange Nectarines, being the best dishes; Mr. Hunter, Lambton Castle Gardens, Durham, was a good 2nd. Mr. Hunter and Mr. McIndoe were 1st and 2nd respectively for four dishes, both showing well.

For four bunches Grapes, not fewer than two varieties, Mr. Hunter was 1st, with Black Hamburg and Gros Maroc, both finely coloured, and of extra size. Mr. McIndoe, who was 2nd, had good bunches, but the Madresfield Court lacked colour. Mr. McIndoe was 1st, with Muscat of Alexandria against larger bunches of Cannon Hall, from Mr. Hunter. For any other white kind, Buckland Sweetwater was the favourite kind, from Mr. Stewart and Mr. Atkinson, Matten Gardens, Corbridge, respectively. The best Black Hamburgs were from Mr. Atkinson, very fine bunches.

Mr. McDonald, gr., Hartford House, Cramlington, had the best Peaches in Barrington, and Mr. Marr, Clitheroe, the best Nectarines in Pitmaston Orange. The two best dishes of Figs were those from Mr. Hunter and Mr. McIndoe. The last-named had by far the best Cherries in Bgarieau Napoleon; and Mr. T. Battenby the best Strawberries in Maréchal McMahon. A fine dish of Perfection (type) of Tomato from Mr. J. Punton, B-nwell Dene, Newcastle, was easily 1st in the class for Tomatoes.

Miscellaneous exhibits were hardly so numerous as last year. Messrs. W. Fell & Co., Hexham, had a remarkably fine exhibit of Conifers in pots and tubs, with other shrubs, making an effective display; with these were cut flowers. Messrs. Little & Ballantyne, Carlisle, had a beautifully arranged group of decorative stove and greenhouse, fine-foliage, and flowering plants, in which Crotons, small Palms, and grasses were conspicuous. Messrs. J. Robson &

Sons showed a good stand of plants, so also did Messrs. Kent & Brydon. Mr. John Jennings also contributed plants. Messrs. Dobbie & Co., Rothesay, had a splendid exhibit of Pansies, Sweet Peas, and other cut flowers. Mr. Forbes, of Hawick, had Carnations in bunches, &c.

THE MIDLAND COUNTIES CARNATION AND PICOTEE.

JULY 22.—The third annual exhibition was held in the Edgbaston Botanical Gardens, Birmingham, on the above date, in fine weather, with a large attendance of visitors, and a very fair display of blooms, and an exceptionally large number of exhibits for the season, as so many of the southern and northern collections were out of flower.

For twelve Carnations, 1st, Mr. T. Lord, Todmorden; 2nd, Mr. R. Sydenham, Birmingham; and five other prizes besides these.

For twelve Picotees, 1st, Mr. R. Sydenham; 2nd, Messrs. Thomson & Co. Eleven stands were staged—a fine lot.

For twelve yellow grounds, Mr. R. Sydenham was 1st; Messrs. Thomson & Co., 2nd.

For twelve selfs, 1st, Mr. R. Sydenham; 2nd, Mr. A. Midhurst.

The classes for six Carnations and six Picotees were also well filled, Mr. Crossley Head, Hebden Bridge, taking the 1st prize in each class.

For six fancy or yellow ground flowers, 1st, Mr. A. W. Jones; 2nd, Mr. A. R. Brown, with five other prizes following.

For six selfs, 1st, Mr. Wm. Kenyon, Bury, Lancashire; 2nd, Mr. E. Shaw, Manchester; with five other prizes following.

Nineteen classes were devoted to single blooms, with four prizes in seventeen classes, and seven each for selfs and fancies; a large number of blooms were staged. The premiers were:—Bizarre Carnation, Master Fred, exhibited by Mr. T. Lord; flake, do., Sportsman, exhibited by Mr. B. Simonite; self, do., Germania, exhibited by Mr. C. Turner; yellow-ground Picotee, Mrs. Robert Sydenham, exhibited by Mr. W. Spencer; heavy-edge, do., Mrs. Payne, exhibited by Mr. R. W. Jones; light-edge, do., Thomas Williams, exhibited by Mr. R. Sydenham.

In the class for twelve varieties of Border Carnations, five stems of each, Messrs. Thomson & Co. were 1st, with four other prizes following; and in the class for six varieties of Border flowers, three stems of each, Mr. C. F. Thurstan, Wolverhampton, was 1st, with three other prizes following.

Shower bouquets, sprays and baskets of Carnations and Picotees, were numerous and well done, Messrs. Thomson & Co. taking the 1st prize for bouquet; Mr. Thurles, Floral Depot, 1st for sprays; and Mr. Herbert, for a basket.

For six Carnations in pots, Mr. Sydenham was 1st; and Messrs. Thomson & Co. 2nd.

There were other classes also for Border Carnations, and for twelve blooms arranged for effect, and good competition in each.

MISCELLANEOUS.

To give more variety to the exhibition, special prizes were offered for bouquets and sprays of Sweet Peas, and some charming exhibits were brought out, Mrs. Thurles being 1st for a lovely shower bouquet; and Miss Francis Mayell 1st for a spray.

Certificates of Merit were awarded to Messrs. Thomson & Co., Sparkhill Nurseries, for seedling self Carnation Topsy, and seedling yellow-ground Picotee Mrs. Spencer, a very fine flower. To Mr. George Chaundy, Oxford, for a fine seedling scarlet bizarre Carnation Albert Whitham.

The Birmingham Botanical Society's Silver Medals were awarded to Mr. Robert Sydenham, for most meritorious exhibits in classes 1 to 4; and to Messrs. Hewitt & Co., Solihull Nurseries, for most meritorious exhibits in classes 29 and 30.

The Botanical Society's Bronze Medals, to Messrs. Thomson & Co. and to Mr. F. Perkins, Leamington, for second-best meritorious exhibits in each section.

Very handsome Medals, given by the Midland Counties Carnation Society, were awarded to honorary exhibits as follows:—Messrs. Hewitt & Co., Solihull, for tuberous Begonias and herbaceous and other cut blooms, a Silver-gilt Medal; Mr. J. White, nurseryman, Worcester, for herbaceous and other cut flowers, a Silver Medal; Mr. B. R. Davis, Yeovil, for a superb display of double Begonia flowers, a Silver Medal; Messrs. Thomson & Co., Sparkhill Nurseries, for a collection of border Carnations, a Silver Medal; Messrs. Jarman & Co., Chard,

Somerset, for herbaceous and other cut blooms, a Bronze Medal; Mr. Henry Eckford, Wem, Salop, for new and choice Sweet Peas, a Bronze Medal.

The *Gardeners' Magazine* Silver Medal was awarded to Mr. A. W. Jones, Handsworth, Birmingham, for general excellence of culture of exhibits.

GARDENING AND FORESTRY EXHIBITION.

JULY 26.—Another of the special fortnightly shows was held at Earl's Court on Wednesday last. The principal classes had been arranged for Carnations and Picotees, but these are very much past their best, and there were but few entries.

Mr. E. Shaw, Moston, Manchester, was 1st in the class for twenty-four Carnations of not fewer than twelve dissimilar varieties; and for twenty-four yellow grounds, Mr. Charles Turner, Royal Nurseries, Slough, was 1st, with a better lot than we had expected.

In the class for twelve, the 1st place was taken by Mr. G. Chaundry, New Marston, Oxford. Mr. Chas. Turner was again 1st for twenty-four selfs and fancies; and Mr. E. Shaw in the class for twelve, who also took 1st for twenty-four Picotees.

Mr. G. H. Sage, gr. to the Earl of Dysart, Ham House, Richmond, was 1st for six varieties of self-coloured border Carnations, and Mr. Chas. Turner 1st for twelve bunches of any border variety or self-coloured Carnation, with Mrs. Apsley Smith a very fine scarlet. Messrs. Paul & Son, The Old Nurseries, Cheshunt, were 2nd for twelve bunches of border Carnations, in as many distinct varieties.

Hardy flowers, in twelve bunches, were best shown by Mr. G. H. Sage, with a very fine lot.

The class for twenty-four bunches of hardy flowers created quite a show. A very fine lot was staged by Messrs. Paul & Son, Cheshunt; and Mr. G. H. Sage was 2nd.

The 1st prize for six bunches of Sweet Peas, distinct, went to Mr. A. Newell, gr. to Sir E. Saunders, Fairlawn, Wimbledon.

Fruit was shown in quantity in all the classes, and the quality was good. The first class was for three varieties of Grapes, two bunches of each, Mr. T. Osman, Ottershaw Park Gardens, Chertsey, being 1st, with extremely good Black Hamburg, Foster's Seedling, and Muscat of Alexandria. Mr. Tidy, gr. to W. K. D'Arcy, Esq., Stanmore Hall, Great Stanmore, was a good 2nd.

Mr. J. Friend, gr. to the Hon. P. C. Glyn, Rook's Nest, Godstone, was 1st for three bunches of Black Grapes, with Black Hamburg; and Mr. W. H. Lees, The Gardens, Trent Park, New Barnet, 1st, for three bunches of white, with Muscat of Alexandria, large and good berries, but not quite coloured. The same exhibitor was 1st for one dish of Apricots.

The 1st prize for six Peaches went to Mr. A. Maxim, gr. to Hon. Miss Shaw Lefevre, Heckfield Place, Winchfield, for a rather uneven dish of Sea Eagle; Mr. W. H. Lees was 2nd.

Mr. W. Tidy had the best Plums, showing Jefferson's; and Mr. R. Gridrod, Whitfield Gardens, Herefordshire, the best Apples, with Irish Peach. The best dessert Pears came from Mr. J. Friend.

Amongst the miscellaneous exhibits, the most noteworthy were the following:—A large collection of hardy flowers and Begonia blooms, from Messrs. John Laing & Sons, Forest Hill, London, S.E. A group of Phloxes and Gaillardias, from Mr. E. F. Such, The Nurseries, Maidenhead. A collection of Sweet Peas, from Mr. Henry Eckford, Wem, Salop. A fine collection of Roses and Carnations, from Messrs. Paul & Son, Cheshunt. Messrs. D. Prior & Son, Colchester, had a large number of Roses. Mr. Geo. Wythes, gr. to the Duke of Northumberland at Syon House, Brentford, a large group of stove and greenhouse plants, and a collection of Melons and other fruits.

A large group of hardy flowers, in great variety, came from Messrs. Barr & Son, Covent Garden; and a collection of orchard-house trees, with fruit in variety, from Messrs. W. Paul & Son, Waltham Cross, Herts.

PLANT NOTES.

HYPERICUM MOSERIANUM.

This is a hybrid raised by M. Moser, of Versailles, from *Hypericum calycinum*—now a naturalised plant in Britain—and the Japanese species *H. patulum*. Mr. Wolley Dod, writing in the *Gardeners' Chronicle*

last April (p. 476), notes that with him in Cheshire it is not hardy, last winter having killed it to the roots beyond recovery. Within a dozen miles of London, however, it appears, so far as the two last winters afford experience, to be hardy enough, even in fairly exposed positions. Certainly it does not stand the cold as well as *H. calycinum*, which retains a certain amount of foliage throughout the winter, but, like *H. patulum*, is herbaceous, and killed back to the ground each year. Owing to long drought, the growth made this season is not so long or so stout as usual, but the plants are already blossoming very freely, and the flowers are remarkably bright in colour. In general character the plant is intermediate between the parents, the golden-yellow flowers measuring 2 inches across, the conspicuous tuft of stamens being brightened by red anthers. One flower only is open on a stem at one time, but a quick succession is maintained, and for a month or six weeks there will be no lack of blossom. *W. J. B.*

LAW NOTES.

ROYAL HORTICULTURAL SOCIETY OF ABERDEEN v. MESSRS. JAMES COCKER AND SONS, ABERDEEN.

IN our issue of April 8 last, we gave the decision of the Sheriff-Principal of Aberdeen, Banff, and Kincardineshire, in the case of Messrs. James Cocker & Sons, rosarians, Aberdeen v. the Royal Horticultural Society of Aberdeen, in which the Messrs. Cocker sought to have the Society "ordained" to receive various exhibits sent in by them, and intended for exhibition at the grand floral *fête* to be held in the Central Park, Kittybrewster, Aberdeen, in August last year, and to submit the same to the judges, in order that the pursuers might get such of the prize-money as might be awarded them. The Messrs. Cocker had been connected with the Society for many years, but in the spring of last year Mr. Cocker, senior, disapproved of the new departure the Society was making in taking their show from the Duthie Public Park and holding it at the Central Park, ultimately resigning his position as a director, and intimating his withdrawal of a contribution which his firm had promised towards the expenses of the show. The pursuers tendered their subscription some days after the last day fixed for payment, but it was returned to them by the directors, who further informed them that they could not accept their exhibits. Sheriff-Substitute Robertson found that the pursuers were barred from competing at the competition, as they had not paid their subscription within the stipulated time. He expressed his doubts as to the remedy sought, but explained that the defenders had waived that point. Defenders were found entitled to expenses. Sheriff-Principal Guthrie Smith, on appeal, recalled the interlocutor of the Sheriff-Substitute, and, although it was too late to pronounce an operative decree, he thought the action was properly brought, and found the defenders liable in expenses. The Society carried the case to the Court of Session in Edinburgh, and the Second Division has just given their decision, dismissing the action, with expenses. The Lord Justice-Clerk, who gave the leading decision, said the Messrs. Cocker had not sought the proper remedy, which was one of damages. An application before a sheriff, to have it ordered that certain plants should be put into a certain competition was unprecedented. As this show was to be held within six days of the application, it was quite impossible, even if the Court had jurisdiction, that any judgment could have been given effect to in time. Lord Young, who followed, remarked that if the pursuers were wronged, they had their remedy in an action of damages. He did not see how the Court could deal with an application for specific performance. It was manifest that to have an order for specific performance carried out in this case was an impossibility. He hoped, however, that the pursuers would not carry the action any further.

A PARTICK GARDENER'S ACTION.

An interesting case has recently been decided by Sheriff Guthrie at Glasgow. James Downes, gardener, Broomhill, Partick, brought an action against his employer, Geo. Breen, for damages for unjustifiable dismissal between terms. Mr. Breen brought a counter-action against Downes, whom he tried to hold responsible for certain plants in the hothouse and garden. The proof lasted several days, and after taking the case to avizandum, the Sheriff found Downes entitled to £10 damages; while in the counter-action he found that the dismissal had not been justified by sufficient evidence of gross failure of duty. Downes was allowed expenses in the joint actions. Mr. Breen has since intimated an appeal to Sheriff-Principal Berry.

TRADE NOTICE.

THE manufacturing firm of Mark Smith, Limited, carrying on the business of manufacturing chemists at Louth, Lincolnshire, have amalgamated with the Horticultural and Agricultural Chemical Co., Glasgow, under the title of Mark Smith, Limited.

CUCUMBER DISEASES.

WITHIN the present month we have received from correspondents residing in widely-separated parts of England, specimens of Cucumber-plants, fruit, leaves, bine, and roots, which were affected with some kind of fungous disease, against which the cultivators were unable to contend by the use of the usual remedies—charcoal-dust, lime, and soot; and in their embarrassment, with, in some cases, large sums of money involved in the cultivation of the plant, they have sought our assistance.

Dr. M. C. Cooke, to whom we forwarded two of the specimens, writes as follows:—

"C. U. The plants are rightly described as containing 'hard black substances enclosed with fluffy-white, which cause the bine to bleed and rot.' These hard substances are a "sclerotium," which is at first whitish, surrounded by a white woolly mycelium, like a white mould, but wholly barren. At length the nodules become harder, naked, and the surface turns black. In this condition, which is a resting-stage, the nodules are like a compact mycelium, or spawn, of a new growth. What this new growth may be can only be determined by watching, and artificial cultivation. In all essentials this disease resembles a disease of Potato haulms, first noticed in *Gardeners' Chronicle*, August 20, 1880, and afterwards traced to its development in a *Peziza* in *Gardeners' Chronicle*, September 15, 1883. This is the first time that we have heard of this disease as affecting Cucumber plants, although in the present case it is stated that it has been observed, more or less, for the past four years; and this year, attributing the disease as in some measure resulting from the soil, all fresh soil and manure were employed in the cultivation. We are assured that the only thing which keeps this disease in check is air, and to use no more water than is positively necessary. The use of sulphur, in any form, is not likely to be of any service, but with such a new form of disease, it is difficult to suggest any remedy or any provision for the future, except burning the diseased portions, so as to destroy the hibernating sclerotia. This disease is known in the United States, and Dr. Humphrey reports that the sclerotium has been cultivated, and found to produce a small *Peziza* (*Sclerotinia Libertiana*), closely allied to the one developed from the Sclerotium of Potato haulms."

"T. W.—The roots of the plants sent in are in a perfectly healthy state, and there are no galls, or trace of Nematode worms. The fruits are rotting at the ends, and the foliage also, but there are none of the symptoms of the disease attributed to bacteria, and none of the microbes have been observed in the diseased portions. All the rotting parts contain

mycelium, and a profusion of spores of one of the 'rots,' called 'Anthracnose' in the United States. As far as can be determined from the present specimens, it is probable that the fungus causing the mischief is *Glœosporium lagenarium*, with sporules 10 or 12 micromillimetres long—that is to say, smaller than in the typical form. Mixed with this fungus is another, but more sparingly, and more superficial, with curved, fusiform, three-septate conidia, which seems to be *Fusarium reticulatum*. It is noteworthy that this same *Fusarium* has always been recorded in company with *Glœosporium lagenarium*. The only remedy yet found to be of service in combating these mischievous and destructive fungi of the *Glœosporium*-type are the copper solutions, such as modifications of the Bordeaux Mixture or Eau Celeste. It would be far better to try a solution of 2 lb. of sulphate of iron in five gallons of water, as, for manifest reasons, sulphate of iron would be preferable to sulphate of copper, where articles of food are concerned." M. C. C.

FRUIT REGISTER.

In a *Bulletin* of the Cornell University Agricultural Experiment Station, Professor L. H. Bailey reports on four recently-introduced fruits, viz.:—

Prunus Simoni, introduced from China, probably, and sent out by Simon Louis, of Metz. By some it is considered so close to the Nectarine as not worth botanical separation—which Nectarine it is like, however, is not stated. The flavour, nevertheless, is "mawkish and bitter," though the fruit is exceedingly attractive to look on. Professor Bailey, though commending it as an ornamental tree, and for the sake of its handsome fruit, says it is worthless for orchard cultivation, but may be useful for hybridising.

The Wine-berry (*Rubus phœnicolasius*) is a handsome Japanese Bramble, described by Maximowicz in 1872, and introduced to Kew in 1875, and figured in our columns in September, 1886. It is ornamental, but useless for fruit. Mr. Berckmans says the plant was known in Holland a generation ago.

The Crandall Currant.—This is none other than the fruit of *Ribes aureum*, one of the commonest of our spring-flowering deciduous shrubs, which does not often produce fruit in this country. Professor Bailey considers this type of Currant to have great promise, as the parent of a new and valuable race of small fruit. The fruits are borne singly, like those of the Gooseberry.

The Dwarf June-berry (*Amelanchier canadensis* var. *oblongifolia*).—The fruits are as large as Marrow Peas, with a pleasant sweet taste, and an agreeable aroma, exceedingly attractive to robins [American ones].

Obituary.

EBENEZER SEWARD—A genial old florist was taken away in a sudden manner yesterday (July 21). Mr. Ebenezer Seward, who for many years had carried on a small business as Florist and Seedsmen, at Godmanchester, walked over to Huntingdon on business, and whilst conversing with the gentleman whom he came to see, died suddenly in the chair in which he was sitting. He will be best remembered in the gardening world as the raiser or originator of *Pvethrum Golden Feather* (raised from a sport). Unfortunately for himself, he parted with it to E. G. Henderson & Son, of the Pineapple Nursery, Edgware Road, at the suggestion of the Rev. G. Pinder, late Vicar of Harford, before its great qualities as a carpet-bedder and edging-plant had been discovered, and before it had been ascertained that the plant reproduced itself perfectly from seed [Mr. Seward was, at that time, gardener to P. E. Tillard, Esq., of Godmanchester. See *Gardeners' Chronicle*, May 29, 1880, Ed.]. I have often conversed with him, and condoled with him on the nice little fortune he seemed to have missed by parting with a plant which became of universal importance. F. H. Cooper.

MR. J. PITHERS—Cultivators of the *Chrysanthemum* will learn with regret of the death of Mr. J. PITHERS, which took place at Chilwell, on Wednesday, the 26th inst. The deceased was *Chrysanthemum* grower to Messrs. J. R. Pearson & Sons for several years, and had proved himself to be an excellent cultivator; but he was well-known in the south of England as a successful exhibitor before going to the midland firm.

VARIORUM.

"THE NORTH BRITISH AGRICULTURIST."—We heartily congratulate this excellent Scottish Agricultural Journal on attaining its jubilee, a circumstance which has been happily celebrated by the issue of a special number, very much enlarged, and enclosed in a smart red cover. It is freely illustrated by portraits of distinguished agriculturists, and by a supplement presenting the portraits of twenty-four of the principal makers and dealers connected with the Scottish Agricultural Implement trade.

LIGHT, AND ANIMAL COLORATION.—The influence of light on vegetable coloration is well understood, and its physical and chemical effects have been carefully observed and explained by Sachs and other morphologists. But the physiological causes of animal coloration have not hitherto been revealed to us, though the matter has frequently been the subject of research. It is well known that several fresh-water and marine fishes change their colour from white to dark as soon as they have been transferred from a medium with a light-coloured bottom to another with a dark-coloured bottom. The common frog can change its colour to some extent in harmony with its surroundings; and so, too, can the green tree-frog, which is bright green among green leaves, but dark green when on the earth or among brown leaves. The causes of these changes have been recently investigated by W. Biedermann, who has discovered three different layers of cells which contribute to give the frog its varying colours. There is first, deeply seated in the skin, a layer of pigment-cells, which contain black pigment both in their interior and in their ramified processes, spreading within the skin. These cells are covered by a second layer of interference cells, containing bright yellow granules as well as granules of a pigment which sometimes appears blue or purple, and sometimes grey—the whole being covered with a transparent outer skin. The normal green colour of the frog is produced by a combination of blue and yellow interference cells appearing on a black background; but if the black pigment of the deepest layer is protruded into its ramifications, the colour of the animal becomes darker; if it retires deeper, the yellow granules of the middle layer become more apparent, and the frog assumes its lemon-yellow colour. Finally, when the yellow pigment gathers into round drops between the bluish interference cells, the skin acquires a whitish-grey tint. The same arrangement exists in other reptiles and amphibia. By a series of experiments it has been proved that light acts in a direct way upon these pigment cells as it does upon the chlorophyll grains in the leaves of plants. *Newcastle Daily Chronicle*.

CERCIDIPHYLLUM JAPONICUM.—The second of the Japanese trees of the *Magnolia* family, is the representative of a monotypic endemic genus. It is the most interesting, as it is the largest deciduous tree of the empire, and more than any other of its inhabitants, gives their peculiar appearance and character to the forests of Yezo. Of the botanical characters and relationship of this tree we shall have something to say in a later issue, in connection with a figure of the male and female flowers, for *Cercidiphyllum* is dioecious, and produces its minute apetalous precocious staminate and pistillate flowers on different individuals. In Yezo, *Cercidiphyllum* inhabits the slopes of low hills, and selects a moist

situation and rich deep soil, from which the denseness of the forest and the impenetrable growth of dwarf Bamboo, which covers the forest floor, effectually check evaporation. In such situations it attains its greatest size, often rising to the height of 100 feet, and developing a cluster of stems 8 or 10 feet through. Sometimes *Cercidiphyllum* forms a single trunk 3 or 4 feet in diameter, and free of branches for 50 feet above the ground; but more commonly it sends up a number of stems, which are united together for several feet into a stout trunk, and then gradually diverge. The trunk of *Cercidiphyllum* is covered with thick pale bark, deeply furrowed, and broken into narrow ridges. Similar bark covers the principal branches; these are very stout, and issue from the stem nearly at right angles, gradually drooping, the slender reddish branchlets in which they end are often decidedly pendulous. The upper branches and branchlets are erect, the whole skeleton of the tree showing even in summer through the sparse, small, nearly circular leaves, which are placed remotely on the branches; in the autumn they turn clear bright yellow. In port and in the general appearance of its foliage, *Cercidiphyllum*, as it appears in the forests of Yezo, might at first sight be mistaken for a venerable Ginkgo tree, which, in old age, has the same habit, with pendulous branches below and erect branches above; but the trunk and its covering are very different in the two trees. *Cercidiphyllum* is distributed from central Yezo southward nearly through the entire length of the Japanese islands. At the north, it grows at the sea-level, and is very common; but on the main island it is confined to high elevations, and is rather rare. Except in Yezo, it seldom grows more than 20 or 30 feet high, and I never saw it, except in that island, below 5000 feet elevation, where, as at Yumoto, in the Nikko Mountains, it is scattered through the lower borders of the Hemlock forest. *Cercidiphyllum* is a valuable timber tree, producing soft, straight-grained, light yellow wood, which resembles the wood of *Liriodendron*, although rather lighter and softer, and probably inferior in quality. It is very straight-grained, and easily worked, and in Yezo it is a favourite material for the interior finish of cheap houses, and for cases, packing-boxes, &c. From its great trunks the Ainos hollowed their canoes, and it is from this wood that they make the mortars found in every Aino house, and used in pounding grain. *C. S. Sargent, in Garden and Forest.*

BOTANY AND ART.—It is the duty of the artist to study congruity in the vegetable forms he brings together, to place every plant in a natural situation, and to imitate the general outline of plants correctly. Some knowledge of botany is required to enable him to do so with confidence, and the greater his acquaintance with the science, the greater will be his capacity for imparting variety to his scenes, without trenching on their truth to Nature. But when the artist has to compose a group of small extent, where a few figures are represented, of a large size, in a limited space, so near the eye of the spectator that every feature and emotion of the countenance is a part of the picture, then, whether it be a sylvan or a garden scene, there cannot be too faithful a representation of surrounding objects. The simple trunk of a tree has its character, varying with the species—the stem of the Oak, of the Pine, of the Beech, or of the Birch—each has its own peculiar surface to be studied by the artist, not to speak of the widely different ramification and foliage of those trees. And so also, and in a greater degree, of the small plants in the foreground. The commonest way-side weeds have a picturesque character. But how seldom do we see a Braubole or a wild Rose naturally represented, or even a Thistle or a Dock. The things that figure in many modern pictures for Brambles or Roses (where the artist is so far ambitious as to attempt a definite representation of them) have no prototype in Nature, and would simply remind us of the ornaments of Christabel's chamber, which were "All cut out of the carver's brain," save that they

are deficient in the grace and delicacy of the great fancies described by the poet. Surely we want a Wilkie or a Teniers for our woods and hedges, to picture faithfully the wildlings of Nature. If a stable-yard and a village alehouse can be refined into a graceful picture, how much more might the thousand picturesque nooks of our island supply subjects to the artist who would be contented to study them minutely, and still with freedom, not in the servility of a mere copyist. Even a subject so homely as the garden of the sluggard, where "the wild Briar, the Thorn and the Thistle grew broader and higher," painted with botanical truth, and in a genial spirit, would form no bad picture. *The Architect.*

DROPSY IN THE TOMATO.—Mr. G. F. ALLANSON records in one of the Bulletins of the Cornell University Experiment Station (May, 1893) a diseased condition of the Tomato, in which the leaves were bent downwards, whilst the leaflets were upturned. The veinlets, midrib, petioles, and surface of the stem, presented numerous elevated areas of a "frosty" aspect, not unnaturally attributed to fungus growths. Microscopic examination, however, showed no fungi, but an overgrowth of the cells of the epiderm and subjacent layers. Experiments were made (1) by inoculating healthy plants with diseased material, and (2) by endeavouring to separate any germs that might be present, to cultivate them, and inoculate with them. Although various bacteria were thus found, and isolated, yet they produced no effect on the healthy plant. It was therefore considered probable that the trouble was due to excess of root pressure over transpiration, in other words that more water was absorbed than the plant could deal with. Transpiration is therefore affected, and the process still further obstructed by the humidity of the house, and the diminished intensity of the light. If the temperature of the soil be high in proportion to that of the air, water is apt to accumulate in the plant. The aim should be to have the temperature of the air considerably higher than that of the roots, to secure sufficient exposure to light, and adequate ventilation. To prove the correctness or otherwise of the inferences, experiments were made by injecting water into the tissues of the Tomato-plant. In this way, changes in the construction of the tissues were produced of a similar character to those observed. The subject is treated in a thoroughly scientific method, so that the Bulletin, within its limits, is one of the most complete applications of science to the explanation of healthy and of diseased function and structure that we have seen.

BANANAS IN COSTA RICA.—It is stated, says Mr. JOHN R. JACKSON, of Kew, that the cultivation and export of Bananas from Costa Rica continues to increase, and that a large company, called the "Banana Company of Matura" has now about 2000 acres under cultivation, and expect in course of time to export 40,000 bunches a month, which would increase the value of the present exports by about £35,000.

MARKETS.

COVENT GARDEN, July 27.

[We cannot accept any editorial responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day, Ed.]

The soft fruit is now finished, and heavy supplies of top fruit are now taking their place, prices ruling low. Trade quieting down. *James Webber, Wholesale Apple Market.*

POTATOS.

Supplies are heavy, and prices are much easier. Best samples, 6s. to 6s. 6d.; medium, 5s. to 5s. 6d.; ordinary, 4s. 6d.

SEEDS.

LONDON: July 26.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., write that the chief interest just now is centred in *Trifolium incarnatum*, a good quantity of which, on early contract purchases, is due shortly in England. Whether the whole of same can be delivered here in time is a puzzling problem. The new Essex Giant Seed Rye is cheap and good. Extreme prices are at present asked for new winter Vetches. For spring Tares there is still a free sale. Mustard keeps scarce and dear. New Rapeseed, on the other hand, is very reasonable. Peas and Haricots keep steady. For Canary-seed there is a quiet sale, on former terms.

FRUITS AND VEGETABLES.

BOROUGH: July 25.—Quotations:—Peas, 2s. 6d. to 3s. per bushel; Cabbages, 3s. to 5s. per tally; Parsley, 1s. 6d. to 2s. per dozen bunches; Turnips, 2s. 6d. to 4s.; Onions, Egyptian, 4s. 6d. to 5s. per cwt.; Cherries, 4s. to 5s.; Plums, 3s. to 4s. per half-sieve.

SPITALFIELDS: July 25.—Quotations:—Peas, 2s. 6d. to 3s. 6d. per bushel; Cabbages, 3s. to 5s. per tally; Turnips, 2s. 6d. to 4s.; Onions, Egyptian, 4s. 6d. to 5s. per cwt.; Cherries, 4s. to 5s.; Plums, 3s. to 4s. per half-sieve.

STRATFORD: July 24.—This market has been well supplied with all kinds of produce during the past week, and a good trade done at the undermentioned prices:—Cabbages, 2s. to 5s. per tally; Cauliflowers, 9d. to 1s. per dozen; Turnips, 3s. to 3s. 6d. per dozen bunches; Carrots, household, 2s. to 4s. 6d.; Mangels, 30s. to 25s. per ton; Onions, Egyptian, 5s. to 6s. per bag; Apples, English, 2s. to 8s. per bushel; Plums, 2s. to 3s. 6d. per half-sieve; do. flats, 4s. 6d. to 6s. per flat; Gages, 2s. 6d. to 3s. 6d. per half-flat; do. baskets, 2s. to 2s. 6d. per basket; Peas, 1s. 6d. to 2s. 6d. per half-sieve; 3s. to 4s. per flat.

FARRINGTON: July 27.—Quotations:—Apples, 4s. per bushel; William Peas, 3s. per case; Greengages, 2s. per basket; English Plums, 3s. 6d. per half-bushel; Melons, 7s. per case; Lettuce, 1s. 6d. per score; Cabbages, 1s. 3d. per dozen; Tomatoes, 5d. per lb.; Peas, 2s. 6d. to 3s. 6d. per bushel; Turnips, 2s. 6d. to 4s. per cwt.; Marrows, 1s. 6d. per dozen; Onions, Egyptian, 4s. 6d. to 5s. per cwt.; Parsley, 1s. 6d. to 2s. per dozen bunches.

POTATOS.

BOROUGH: July 25.—Quotations:—New: 5s. to 7s. per cwt. No quotations for Old.

SPITALFIELDS: July 25.—Quotations:—New: 5s. to 7s. per cwt.

STRAFORD: July 26.—Quotations:—English Kidneys, 90s. to 160s.; Hebrons, 110s. to 120s.; Snowdrops, 100s. to 120s.; Bruces, 100s. to 110s. per ton.

FARRINGTON: July 27.—Quotations: Red Beauties, 120s. to 130s.; white do., 120s. to 130s.; Snowdrops, 130s. to 140s.; Regents, 120s. per ton.

LONDON AVERAGES: July 26.—New: English Hebrons, 100s. to 120s.; Snowdrops, 100s. to 120; Kidneys, 90s. to 120s. per ton; Canary, 7s. to 9s., and other foreign kinds, 4s. to 6s. per cwt.

CORN.

Averages.—Official statement of the average prices of British corn, imperial measure (quarter) for the week ending July 22, and for the corresponding period in the previous year:—1893: Wheat, 28s. 5d.; Barley, 20s. 3d.; Oats, 21s. 9d. 1892: Wheat, 29s. 3d.; Barley, 22s. 10d.; Oats, 21s.

HAY.

Averages.—The following are the averages of the prices during the past week at the principal metropolitan markets:—Clover, prime, 140s. to 165s.; u-w, do., 115s. to 130s.; inferior, do., 100s. to 120s.; hay, best, 145s. to 165s.; inferior, do., 90s. to 100s.; new, mixture, 115s. to 130s.; and straw, 12s. to 50s. per load.

(By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.)

The districts indicated by number in the first column are the following:—

- 0, Scotland, N. Principal Wheat-producing Districts—
- 1, Scotland, E.; 2, England, N.E.; 3, England, E.;
- 4, Midland Counties; 5, England, including London, S.;
- Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.;
- 10, Ireland, S.; * Channel Islands.

THE PAST WEEK.

The following summary record of the weather for the week ending July 22, is furnished from the Meteorological Office:—

"The weather was again very unsettled, with heavy falls of rain in many parts of the kingdom. Thunderstorms occurred at several of our northern stations on the 16th or 17th.

"The temperature was slightly below the mean in most of the 'Wheat-producing' districts, as well as in 'Scotland, W.,' but in other localities it agreed almost precisely with the normal. The highest readings, which occurred at various times in the different districts, but mostly about the middle of

the week, were, as a rule, a little above 70°. In the West and North of Scotland, however, the thermometer did not reach that point; while in 'England, N.W.' (at Stonyhurst), it rose to 76°. The lowest readings, which were also observed on varying dates, ranged from 30° or 40° in the 'Scotch districts,' to 48° in 'England, S.' and 'England, N.W.,' and to 56° in the 'Channel Islands.' On the night of the 19th, the thermometer in many parts of England did not fall below 60°.

"The rainfall varied considerably, not only in different parts of the kingdom, but also in neighbouring portions of each district. In 'England, N.E.,' the 'Midland Counties,' 'England, N.W.,' and 'Ireland, S.,' there was a deficit—mostly very slight; but in other districts the amount was more than the mean, the excess being large at many of our western and extreme northern stations.

"The bright sunshine was also very irregularly distributed. In the eastern and southern parts of England, as well as in 'Scotland, N.,' there was a deficiency; but in other districts the amount was in excess of the mean. The percentage of the possible duration ranged from 15 in 'Scotland, N.,' 29 in 'England, E.,' and 30 in 'England, S.,' to 17 in 'Ireland, N.,"

** The great demands on our space compel us to postpone some, and pass over other communications that were marked for insertion.

ARECA NUTS: W. G. The fruit of a species of Palm—Areca Catechu.

BEGONIAS: J. C. The leaves are affected by a species of rust fungus such as occurs on Gloxinias, Grapes, &c., and may be induced by the same errors in culture. It cannot be cured; avoid checking growth by cool currents of air blowing through the lower ventilators.

BRICK WALLED GLASSHOUSE: A. P. If the foundations be made in the ground, it becomes a landlord's fixture, and may not be removed by the tenant, unless the former is willing.

CARNATION: J. Cobban & Son. Your seedling of a dark crimson colour, is an excellent border variety; hardy, very double, large, full, and fragrant, and being fit for cutting earlier than most; it is an acquisition for market growers.

CARNATIONS AND TOMATOS: J. B. Send your full address, and we will communicate with you. You will do well to use the Bordeaux Mixture on your Tomatos, if they have not got too bad. We gave the recipe for this mixture in our issue for July 1.

CORRECTION.—Owing to a misprint in our notice of the Royal Horticultural Society's show at Islington, the date was given in our last issue as August 22 instead of August 29. It will remain open till September 1.

DISEASED LILIES: Lily. The too-common Lily fungus. Try spraying with Bordeaux Mixture next early season. We are aware the fungus is internal, but the copper solution may be useful nevertheless. Burn the diseased stems.

FUNGUS FROM A COAL-PIT: G. W. It is a Polyporus (Fomes annosus, Fr.), not uncommon in mines, but stunted and deformed.

HEDGE UNDER SHADE TREES: B. O. P. Amongst deciduous shrubs the best for the purpose is the Cornelian Cherry (Cornus mas), as it may be close clipped twice or thrice a year for a number of years without apparently being the worse for it. There are variegated forms of it.

HYACINTHS GROWN IN WATER: D. B. Philip Miller was, we believe, the first to bring this practice into notice, by a publication of an article in the Philosophical Transactions, vol. xxxvii.

LETTUCE: A. M. The plants were injured by the young of woodlice, and in the case of those sent by "A. M." a fungus had completed their destruction.

LETTUCES TO CUT IN HOUSES, AT END OF FEBRUARY: New Reader. We assume that the seed will be sown in the open air, and the plants also grown there till they have become somewhat less than half-grown before they are lifted early in November, and planted in the houses. Good varieties of Cabbage Lettuce are:—(Veitch's) Golden Queen, early dwarf, compact, remaining a long time in good condition, and one of the best for early forcing; Perfect Gem (Veitch's), compact, close, solid, does not bolt readily; All the Year Round, Early Paris Market, and Lee's Hardy Green. Cus varieties: Brown Bath, Hick's Hardy White, and London White. The seeds of the above may be sown in the first week in September, thickly, in drills, and great care be taken to prevent drawing, thinning them early to 6 or 8 inches apart. We should not recommend sowing seed in the houses before the first week in February, and then it should be done in pans or boxes placed close to the glass in a temperature at night of 55° to 60° by 65° to 68°. Very little forcing can be done before the sun has gained some power—say, in the middle of February—and then it must be very gradual; all the more reason to have strong plants raised in the autumn. Great attention must be paid to ventilation, so as to avoid loss by damp, and every ray of light should reach the plants from November to February; therefore, keep the glass as clean as possible. The temperature at that period may be 45° to 50°, with a 5° rise by day.

MARKET CUCUMBERS: New Reader. Sion House Improved and Masters' Prolific for winter fruiting, Lockie's Perfection and Telegraph for summer, also the second-named variety.

MELONS: T. W. The germination of the seeds within the fruit is not uncommon.

NAMES OF FRUITS: J. S. Apple, Red Astrachan.—F. D. 1, New Hawthornden; 2, Duchess of Oldenburgh; 3, Probably Stone's Apple.—M. I. Gooseberries: 5, Crown Bob; 6, Yellow Rumbullion. Peach: Pavie de Pemponne, a worthless clingstone; the other Peaches were quite rotten.

NAMES OF PLANTS: E. C. C. D. Lord Anson's Pea.—J. A. C. Lysimachia thyriflora.—Wm. W. 1, the Orchid cannot be recognized from the bad specimen sent; 2, Campanula persicifolia; 3, Campanula persicifolia, double-fl.; 4, Campanula persicifolia; 5, Campanula isophylla; 6, Campanula Trachelium, double white.—J. S. Turkey Oak, Quercus cerris.—W. C. & Son. We cannot name your Oak with certainty. We believe it to be one of the numerous forms between Q. suber and Q. ilex.—G. H. Balm, Melissa officinalis, broad; Savory, Satureia montana, narrow, both S. European.—Folkstone. Burnet, Poterium Sanguisorba; the young leaves are used in salads in France. We have very rarely seen them so used here.—Dr. Slims. Melilotus officinalis.—J. S., Sevenoaks. 1, Athyrium filix-femina; 2, Lomaria procerca; 3, Onychium japonicum; 4, Todea africana (barbara); 5, Litobrochia vespertilionis; 6, Lomaria nuda.—S. S., Crawley. 1, Adiantum hispidulum; 2, Adiantum tenerum; 3, the same; 4, Aspidium coriaceum; 5, Aspidium aristatum variegatum; 6, Pteris serrulata cristata; 7, Pteris longifolia.—J. J. 1, Justicia carnea; 2, Lantana, a garden variety; 3, Campylobotrys retulgens.—C. S., Stirling. 1, Helianthus punicus; 2, Lythrum Salicaria; 3, Sanguisorba canadensis grandiflora; 4, Sedum spurium; 5, Helenium autumnale; 6, Panicum plicatum.—J. R. 1, Odontoglossum Lindleyanum; 2, Selaginella Brownii; 3, S. denticulata; the other, without number, is S. Wildenovii.—F. P. D. J. Aspidium spinulosum (Lestree); 2, Aspidium (Polystichum) angulare; 3, the same species; 4, Lomaria alpina; 5, Lestree filix-mas; 6, Pteris quadriaurita; 7, Dicksonia antarctica; 8, Aspidium lepidum.—G. H. S. 1, Carica papaya; 2, Clerodendron fragrans flore-pleno; 3, Solanum Warszewiczii; 4, Send fair specimen; 5, Apheandra Portuana; 6, Bignonia argyrea volucrens; 7, Momordica charantia.—Ipomoea. Convolvulus mauritanica.—G. McKenzie. 1, Sidalcea oregana; 2, Thalictrum angustifolium.

NOTICE OF LEAVING EMPLOYMENT: A. P. Being a weekly servant, a week's notice is sufficient on either side.

PORTLAND CEMENT HOT-WATER PIPE JOINTS: A. P. It is safe enough as a joint, if the space between the pipe and collar is filled with a rather liquid cement, and the pipes are firmly supported. It is well to put into the joint a ring of tow or oakum before running in the cement.

PRUNUS PISSARDI: J. B. This may be expected to fruit freely in future. It has not long been introduced.

ROSES: Jersey. We believe that the Rose finds no place in the sculptures or paintings of ancient Egypt. Hehn (Wanderings of Plants) says that the Greeks were earlier acquainted with the Rose than the Hebrews. Basing his statement upon linguistic considerations, Hehn traces the spread of the Rose from Media by way of Armenia and Porygia to Greece.

SHANKING: A. Y. Z. It is due to some fault of nutrition; the balance between absorption by the roots and transpiration by the leaves is somehow upset, how we cannot tell; you should be the best judge.

SIX CHRYSANTHEMUMS FOR CUTTING FOR MARKET: New Reader. Elaine, white early; La Nympe, white early; La Triomphante, white, suffused with purple-rose, mid-season, tall; William Holmes, chestnut-red, tipped gold, early; Val d'Andorre, orange-red, mid-season; Margot, rosy-salmon, early, large recurring petals. The above are Japanese reflexed varieties. Six Japanese, not reflexed:—Source d'Or, orange, gold shading, mid-season; Thunberg, soft yellow, mid-season; Mr. H. Cannell is like the last, but finer; Mdlle. Lacroix, white, large, full, early, not tall; L'He des Paisirs, yellowish-crimson, early, very free; Lady Selborne, white, early; Flamme de Punch, orange, shaded red or crimson, early.

SPAWN: S. H. M. H. Probably, toad's spawn.

TOMATO DISEASE: J. J. Dress the foliage with the Bordeaux Mixture. See our issue for July 1 and July 22 this year. The fungus is a Peronospora allied to that of Potatoes.—F. G. M. The name and nature of the disease affecting your Tomatoes, and the cure for the same, have been very frequently given in these pages, and so lately as July 1 (p. 19) and July 22 (p. 108).

VINE DISEASE: J. S. and J. K. The disease is the same as commented on by Mr. Blackmore. It is now known to be caused by a fungus-like creature allied to that which causes clubbing in Cabbages. We shall have more to say about it when the pressure on our space abates.

WOODLICE IN CUCUMBER PITS: G. T. Pour boiling water into their haunts. Diluted carbolic acid would have a good effect used in the same manner. Many could be trapped in flower-pots or drains stuffed with hay.

WANTED, a HEAD WORKING GARDENER at Winchmore Hill. No Children. Use of Cottage. Must thoroughly understand Vegetables and Fruit. Under Gardener kept.—Apply in first instance by letter, stating full particulars, to G. A. R., Messrs. Deacon's Leadenhall Street, E. C.

WANTED, a Married MAN, as HEAD WORKING GARDENER. Wife to take charge of house in winter months; 40 miles from London. Personal characters indispensable. Total abstainers preferred.—Apply, by letter, stating ages and full particulars, to H., Mr. Bachhoffner, High Street, Clapham, S.W.

WANTED, an UNDER GARDENER.—Church of England. Abstainer. Not under 20. To live in the house. Fair knowledge of Garden and Greenhouse Work.—Mrs. ROE, Kendall Hall, Elstree, Herts.

WANTED, a WORKING FOREMAN in a Gentleman's Garden, near London, where five or six hands are kept. He must be a middle-aged married Man, without children or grown-up family, civil and obliging, who thoroughly understands his business as a practical hard-working Gardener (Inside and Out), able to produce a constant supply of Vegetables, Flowers, and Fruit, and to take charge of place when wanted. Wages, £1 per week and lodge. Wife must be a clean, tidy, and domesticated woman (used to service), as she would be employed in the House from time to time, for which she would be paid in addition to her husband's wages. It is hoped that no one will reply to this Advertisement unless the very best personal characters can be produced.—Reply, by letter only, O. P. Q., Messrs. D. Gosden & Co., 17, Tavistock Street, Covent Garden, W. C.

WANTED, by October 1, a NURSERY FOREMAN (Working, married), experienced in the Propagation and Management of Ornamental Shrubs, Fruit Trees, and Roses. References must bear testimony of method and accuracy, sobriety, and general good character.—Full particulars of experience, age, and wages expected, to CANDOR, *Gardeners' Chronicle* Office, 41, Wellington St., Strand, W. C.

WANTED MAN and WIFE; Ages 40 to 50, without family, to live in the house in an Eastern Suburb of London. The man is required to Manage a Small Garden and Greenhouse (no Kitchen Garden), and to make himself generally useful; the wife to act as a good plain Cook. The family consists of two ladies. Wages to begin at £10 a year, all found, except beer.—Address, F. R. S., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W. C.

WANTED, an UNDER FOREMAN.—Thoroughly experienced in Mushroom Growing in Sheds and in the Open. One who is a good Grape Thinner preferred.—D. B., Calcut Gardens, near Reading.

WANTED, a MAN, who thoroughly understands the Growth of Cucumbers, Tomatos, Chrysanthemums, Melon-croons, Bedding Plants, &c., for market work. State wages required.—JOHN HEYWARD, Market Gardener, Harlington, Hounslow, Middlesex.

WANTED AT ONCE, owing to sudden death of our Grower, a MAN thoroughly well up in Chrysanthemums.—J. and R. PEARSON, Chillwell Nurseries, Notts.

WANTED, a PROPAGATOR and GROWER for Market Nursery; used to Palms, Ferns, and soft-wooded plants. State age; wages expected with experience, to Wm. TROUGHTON, Nurseryman, Preston, Lancashire.

WANTED, a SECOND HAND (for a Market Nursery. Good Stoker, and used to Roses and Carnations.—T., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W. C.

WANTED, a young MAN, to Grow Plants, &c., for Market. Good character indispensable; abstainer preferred. Apply, stating wages, &c., to S. SPOONER AND SONS, Cart Bridge, Woking.

WANTED, a young MAN, well accustomed to Stove Stuff. Scotchman preferred. Only practical man with good character need apply.—State wages required, experience, &c., to H., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W. C.

WANTED, a JOURNEYMAN for the Vineries.—Can any Gardener recommend a good man as above?—Apply GEO. ABBEY, Avery Hill, Eltham, Kent.

WANTED, a GARDEN LABOURER, young, strong, and active, and a good character.—Write, stating age, and last and present employers, to ROBERT REID, Esq., Barra Hall, Hayes, Middlesex.

WANTED, a young MAN, about 19 or 20, to assist in the Orchard-houses.—State wages required, and experience, if with Orchards.—CHARLES WINN, Selly Hill, near Birmingham.

WANTED, a strong, active, intelligent LAD, as Improver in the Houses.—Apply, GARDENER, Holkham, Norfolk.

WANTED, an IMPROVER, in a Market Garden, under Glass, where Bloom is grown for sale. Must be quick and active; if able to act as Clerk occasionally, would be preferred. Wages from 10s. to 12s., and bothy.—L., The Oaks, Emsworth.

WANT PLACES.

F. SANDER AND CO. can recommend several highly qualified and energetic HEAD and UNDER GARDENERS, of excellent character, and proved ability; men thoroughly fitted for all the various duties of their profession. For all particulars, please apply to—
F. SANDER AND CO., St. Albans.

TO NURSERYMEN and FLORISTS.—A young man, age 26, sober habits, good Wreath and Bouquet Hand, also Plant and Flower Salesman, is desirous of a good situation.—**B., 48**, Carnarvon Street, Cheetham, Manchester.

TO FLORISTS.—Re-engagement wanted by a Young Lady (age 18). First-class experience.—**J. Y.,** Messrs. W. Clabran & Son, 10 and 12, Market Street, Manchester.

"A FRIEND IN NEED IS A FRIEND INDEED" may be classed amongst the most time-honoured of our old proverbs. Although it has not escaped the lynx-eye of the modern humorist. He denies its truth, and argues that the "friend in need" is often a great nuisance, calling upon friends in better circumstances at inopportune moments with a flesh-creeching tale of woe, and the modest request for a man of a ten-pound note. This puny jockey, however, does not impair the truth of the proverb. Holloway's Pills and Ointment have been true friends in need to many a poor sufferer when all hope of relief has fled. There is no known disease that can withstand their healing influence.

Send for ILLUSTRATED LIST of

JOHN BLAKE'S PATENT SELF-ACTING HYDRAULIC RAMS,

For Raising Water for the Supply of Towns, Villages, Irrigation, Railway Stations, Mansions, Fountains, Farms, &c.

No cost for Motive Power, which is obtained from a Stream of Water passing through the Ram. No Oiling or Packing required. Made in sizes to raise from 300 to 200,000 gallons per day. Will force to a height of 1500 feet.

SPECIAL RAMS for HIGH FALLS to send up One-third of the Water passing through them.

Fig. A.

This Ram raises a portion of the same water that works it.

View of Ram worked by water from a spring, and supplying the house and garden on the hill.

Fig. B.

This Ram, whilst worked by a stream of impure water, will pump clean water from a well or spring.

TESTIMONIALS FOR JOHN BLAKE'S PATENT SELF-ACTING HYDRAULIC RAMS:—

From T. DYNE STEEL, Esq., M.I.C.E., Past Pres. South Wales Inst. of Engineers, Bank Chamb., Newport, Mon., April 24, 1891. Usk Waterworks.

"DEAR SIR.—In September of last year I applied to you for a Hydraulic Ram for the purpose of the Usk Waterworks, to be capable of raising 27,000 gallons per day a height of 127 feet, with a working fall of driving water of 27 feet, and on your guaranteeing that performance, I gave you an order for the Ram. The Machine you supplied has now been put to work, and I have much satisfaction in saying that it far and away exceeds in its performance my most sanguine expectations, and possibly yours also. I have just completed a series of exhaustive tests with the following results:—

"Working fall of driving water, 30 feet; vertical height raised, 127 feet; length of rising main, 850 feet from Ram to outflow; length of supply pipe, 200 feet; gallons per hour raised 1512; driving water used per hour, 885 gallons, showing the remarkable and gratifying result of 83 per cent. of efficiency.

"The tests were carefully made and repeated, the water measured, and levels properly taken. Several trials were made, and I shall be glad to give any Engineer interested in the subject facilities for repeating the tests at the spot.

"I may here state that for the rising main I used a large diameter of pipe in order to reduce friction, with excellent effect.

"Yours faithfully, T. DYNE STEEL."

From C. PAGE WOOD, Esq., Wakes Hall, Wakes Colne, Essex, January 11, 1889.

"SIR.—In reply to your inquiry, the Hydraulic Ram you put down for me in 1884 has cost me only 6d. in repairs (for a new stud my blacksmith made); the second Ram you put down to supply an off hand farm has been running three years, and has cost not a penny in repairs; the third and largest Ram you put down two months ago, which is for the supply of water to my neighbours, is running satisfactorily. All three Rams throw up more water than you guaranteed. From enquiries I have made from friends who have Rams of other makers, I am convinced of the superiority of yours, and my third order is a proof of my good opinion. My abundant water supply is the greatest possible comfort to me.

Yours faithfully, C. PAGE WOOD."

From Mr. THOMAS VARLEY, Agent to the Trustees of the late WILLIAM ROUNDELL, Esq., Gledstone Estate, West Marton, Skipton, August 11, 1887.

"DEAR SIR.—The Patent Hydraulic Ram you fixed five years ago on this estate is still working as well as it did on the day it started. It is driven by spring water carried along the hillside in 950 yards of iron pipe, and forces up an abundant supply to an underground tank on the hill at a distance of two miles from and at an elevation of 280 feet above the Ram. The water is then gravitated through several pipes and branches, having a total length of about four miles, for the supply of the mansion, garden, stables, estate work-shop, and steam boiler, the village of West Marton, and several farms. There are five fire-plugs inside the mansion and seven outside; and as the underground reservoir is 70 feet above the mansion, seven jets of water can be thrown over the house in case of fire. As there is still a considerable overflow from the underground reservoir running to waste, I intend to form a second reservoir at a lower level, and utilize the water for other farms. I have much pleasure in being able to report as above."

Blake's Hydraulic Rams have been supplied to the following amongst others:—

- His Royal Highness the Duke of Connaught
- His Highness the Maharajah of Kishnur
- His Grace The Duke of Devonshire
- His Grace The Duke of Westminster
- His Grace The Duke of Cleveland

ROBERT WARNER & Co., Engineers, 27, Jewin Crescent, E.C.
 Dear Sirs,—It affords me much pleasure to inform you that the 25 ft. Annular Sash Windmill, on 40 feet timbers, working a set of 3 in. x 3 in. stroke treble pumps, that you had here for Baron Schroder, is giving very great satisfaction, pumping the water through 4,224 feet of pipe, to a vertical height of about 80 feet. I must also express my thorough appreciation of the manner in which the whole of the work has been so successfully carried out.—Yours faithfully,
H. BALLANTINE, Head Gardener to Baron Schroder.

THE
Gardeners' Chronicle.

SATURDAY, AUGUST 5, 1893.

ROSES AND THE SEASON.

THE Metropolitan Show of the National Rose Society on July 1 will be long remembered in many ways; it was without doubt the worst show the Society has ever held since 1879. In that year the incessant downpour during the blooming season caused the utter collapse of a great many exhibitors, and the very bedraggled and faded exhibition of the Roses which did appear. In 1893 the conditions were just the reverse, the inferiority of the show was not owing to excessive moisture but to excessive drought, and although in a few instances where thunderstorms have prevailed there were some weather-beaten flowers, yet on the whole, the falling off was not in the form or colour of the flowers, but in deficiency of size, which could, of course, be easily accounted for by the long spell of dry weather.

Exhibitors who had a good supply of water had an immense advantage, and hence some amateurs were able to overcome the difficulties of the season.

Another notable feature was the utter collapse of the Southern and Western growers, and the triumph of the North and East. Messrs. Harkness & Son, of Bedale, swept everything before them, as they have done in every show where they exhibited this season. The cooler climate of Yorkshire and the abundant rains which they have experienced, helped them to attain this end. Other exhibitors from the North and North-Midlands also came to the front, Messrs. Mack of Catterick and Croll of Dundee, amongst nurserymen, and Mr. H. V. Machin, Worksop, amongst amateurs, being successful exhibitors; but the renowned Colchester growers, the Tea champions from the West of England, and growers from the southern counties had, with few exceptions, to bite the dust. I asked one of the champion growers from Exeter, "Have you any Roses here?" His reply was, "Mine were over weeks ago," and I believe this was literally true. The collapse also of the two growers who had held the Champion Tea Challenge Cup was unmistakable; and so much was this the case that even at the show in their own neighbourhood at Gloucester they did not put in an appearance. Another notable feature was the manner in which some of the older and more highly-coloured Roses were shown. One would have supposed that the intense sunlight would have quite bleached such flowers as Horace Vernet, Duke of Wellington, Earl of Dufferin, Louis Van Houtte, Camille de Rohan, and others; but rarely have these and other old favourites been better exhibited, while the light Roses were many of them remarkably fresh and clean. It is not often that we see light and dark Roses equally well shown in the same season; the

bloom of Horace Vernet by which Messrs. Harkness & Sons obtained the Silver Medal, was perfect in form, colour, and size; but the same can hardly be said of the Ulrich Brunner which obtained the Silver Medal in the amateur class.

The Tea classes were not nearly so well represented as on some occasions, or, indeed, as at the Drill Hall on June 20, but the victor on that occasion, the Rev. A. Foster-Melliard, carried all before him; no finer bloom of Madame Cusin was ever exhibited as that in his stand, indeed, it is questionable whether it was ever shown so well, and some have even said that it was the best Tea Rose ever exhibited. The Bride, which won the Silver Medal in the nurseryman's class for Mr. B. R. Cant as the best Tea Rose, was perfect in every respect; another Tea Rose which was well shown was Jean Ducher, so disappointing to the exhibitor in wet seasons, but rejoicing very much in the long spell of dry weather. Among the Tea Roses which disappointed us was Ernest Metz. For three consecutive years the National Rose Society has singled it out for special exhibition. In 1891 and 1892 there was no competition, and when the subject was debated as to whether it should have the same place this year, it was said, "Give it another trial, as the two wet seasons have not been in its favour." The class was retained, and with the same result; only two stands of it were shown, and it must be uncertain in its blooming, for many exhibitors who grow it to some extent were unable to stage it. It does not seem to have been a favourable season for Comtesse de Nadaillac; for, although there were some pretty blooms of it, I did not see a first-rate one; on the other hand, Marie Van Houtte seems to have found a season which specially suited it. Its beautiful yellow-ground and pink edges were never more distinctly seen; a bloom of it in the Rev. A. Foster-Melliard's stand, which had been cut from the bush the Monday previous, was specially noticeable. Again, Her Majesty was well exhibited by Mr. F. Cant and others, but I think few would care to have it in the large Pæony-like form of the half-dozen blooms shown by Dr. Tucker of Farningham.

Remarkable, too, was the exhibition of new Roses, not for its extent, but from the fact that three Gold Medals were awarded, two of these going to one firm, Messrs. Alex. Dickson & Sons, of Newtownards—a feat never before accomplished by any firm; and the third being given for the first time to a garden and non-exhibition Rose. Two Roses shown by Messrs. Dickson were, Marchioness of Londonderry, a large pure white and full Rose, and Mrs. Sharman Crawford, a brilliant rosy-pink flower, of fine form, large petals, and bright in colour. They had a third, Miss Kellar, which some of the judges looked upon with favour, but there was no ground plant exhibited with the blooms, and consequently it could not be entered for competition. The garden Rose for which the Gold Medal was awarded, was that fine Crimson Rambler, shown by Mr. C. Turner of Slough, a crimson semi-double Rose of the Polyantha section, blooming in immense clusters, and evidently most vigorous in habit; a plant of it was exhibited in the pot about 9 or 10 feet high: this Rose has already received the highest awards it was possible to obtain, including a Gold Medal from the Central Horticultural Society of France, and there is no doubt it will be immensely popular as a pillar Rose. Of the French Roses of the last two years, next to nothing was seen. Gustave Piganeau was well shown, but did not obtain the same high position as it did last year,

for neither here nor at Worksop was it placed as the premier Rose.

Garden Roses were, as might have been expected, a disappointment; June was the month for them this season. The Gallicas, Hybrid Bourbons, and Hybrid Chinas were conspicuous by their absence; so also were the single Roses, most of which, at any rate in the South, had been over for a fortnight or more. Hence, in many cases the exhibitors were so hard pushed, that they had to put in Roses which, under a strict interpretation of the Society's rules, would have been excluded. L'Idéale has again shown itself to be a most valuable and beautiful flower, and a worthy rival of William Allen Richardson, although very distinct from it in colour; another Rose, a Hybrid Tea, Gustave Regis, is likely to become a favourite as a garden Rose; it has a very long pointed bud, only semi-double, clear yellow in colour, and having long strong shoots, which will bear pegging down, and most likely form a valuable bedding Rose. A semi-double—almost single—Rose was shown by Mr. F. Cant, but it was generally considered too much like Bardon to be of very special value.

There were no complaints as at last year's show about want of space or accommodation, which, as was pointed out at the time, arose then simply from the existence of the Electrical Exhibition, and the opinion was general that there is no place like the Crystal Palace (notwithstanding the difficulty of getting to and leaving it) for the Society's Metropolitan Exhibition. *Wild Rose.*

NEW OR NOTEWORTHY PLANTS.

HYMENOCALLIS CONCINNA, Baker, n. sp.*

This new species of *Hymenocallis* has been imported lately by Messrs. Dammann, from Mexico. In habit it resembles the small forms of the West Indian *H. caribæa*; but it is quite hardy at Naples, whilst *H. caribæa* needs protection, and the leaves remain upon the bulb all the year, whilst *H. caribæa* loses its leaves in August, and is at rest till March.

Bulb small for the genus. Leaves lorate, sessile, an inch broad, and as long as the peduncle when the plant is in flower. Peduncle slender, a foot long. Flowers many in an umbel, quite sessile; spathe-valves few, ovate-acuminate or lanceolate. Perianth-tube slender, 2 inches long; lobes linear, as long as the tube. Filaments shorter than the lobes; basal cup funnel-shaped, half an inch long, the edges not at all spreading; anthers very long and slender. *J. G. Baker, Herbarium, Kew.*

POLYSTACHYA LAWRENCEANA, Kränzlín.†

This *Polystachya* is certainly one of the most showy of the genus, the flowers being more than half an inch in diameter, and of comparatively bright colour. It is very near to *Polystachya laxiflora*, Lindl., from Fernando Po, and *P. puberula*, Lindl.;

* *Hymenocallis concinna*, Baker, n. sp.—Bulbo parvo; foliis persistentibus sessilibus loratis; pedunculo gracili pedali; umbellis multifloris, pedicellis nullis; perianthii tubo gracili b. pollicari, segmentis linearibus tubo æquilongis; filamentorum tubo brevi infundibulari, margine suberecto.

† *Polystachya Lawrenceana*, Kränzlín.—Bulbis subglobosis; foliis oblongo-lanceolatis acutis late viridibus sub anthesi 3½ pollic. longis et 1 pollic. latis; seapo 12–15 cm. alto, cataphyllis destituto puberulo; racemo simplice paucifloro distichantho; bracteis magnis rhombicis acutis apice reflexis, 3 ovarii pedicellati æqualibus ipsis et toto flore extus puberulis; sepalis dorsali oblongo acuto; petalis æquilongis linearibus acutis vix semilatis; sepalis lateralibus latissime triangularibus extus carinatis basi coalitis; labelli lobis lateralibus dolabratis antice rotundatis auratis; lobo intermedio multo majore fere orbiculari medio sulcato antice deflexo coarctato; disco inter lobos laterales pulvinari triangulari depresso piloso instructo; superficie lobi intermedii rugulosa ceterum calva; gynostemio perbreve ceterum generis. Flores inter majores generis sub anthesi 1.5 cm. dimetro; sepala petalisque luteo-viridia; labellum pallide lilacinum. *F. Kränzlín.*

but it differs from the latter by the larger flowers, and from the first-named by its simple raceme (*P. laxiflora* has a many-branched flower-stalk), the tip of the labellum (three-toothed in *P. laxiflora*, simple in our species), the hairy cushion and the colour of the flower, which is green and pale lilac in our species, whilst the flower of *P. laxiflora* (which flowered at Kew in May, 1861) is of a pale yellow colour. In spite of all these differences, which are more than sufficient to establish a new species, *P. laxiflora* is the next to *P. Lawrenceana* and all the others, even *P. odorata*, Lindl., from Fernando Po, show greater difference. The plant was imported by Mr. J. O'Brien from Sierra Leone, and flowered by Mr. White, Orchid grower to Sir Trevor Lawrence, M.P., at Burford Lodge, Dorking. A revision and compilation of the species of *Polystachya* described in the botanical works, prove how rapidly the number of known species of this genus is increasing. Lindley in his *Genera and Species* enumerates five species; in his *West African Tropical Orchids* he adds nine new ones. Reichenbach in the sixth volume of *Walper's Annalen* (only a compilation of newly-described species), enumerates twenty-two; in Bentham and Hooker's *Genera Plantarum*, forty species are admitted; and for myself I dare say, that after a careful examination of all materials I could reach, at least sixty species are described, all without exception by authors of high range in botany, or at least, by men well acquainted with Orchids. I received fresh materials from the collection of Sir Trevor Lawrence, Burford, Dorking. *F. Kränzlín.* [We learn that the species was sent to Mr. O'Brien by Mr. John Buchanan from the Upper Zambesi, not from Sierra Leone. Ed.]

CATTLEYA WARSCWICZII VAR. FRANCONVILLENSIS.

In a chastely beautiful white form of that most noble of all Cattleyas—*C. Warszewiczii*—comes a fresh surprise from the collection of M. le Duc de Massa, Chateau de Franconville, France. Not even the long journey the specimen had undergone could dim its beauty, and it arrived almost as fresh as when cut.

The flower is fine in form and size; the sepals and petals pure white. The lip is of a lighter hue of bright purplish-crimson than in the ordinary form, the front portion being simply marbled with that colour on a pure white ground, a broad margin of white also running round the edge. The eye-like blotches on each side of the middle of the labellum peculiar to all the forms of *C. Warszewiczii* except that magnificent novelty, *C. W. Rothchildiana*, which was imported in the same lot as *C. W. var. Franconvillensis*, are cream-white, with a yellow tinge on the portion nearest the base. It is an altogether unexpected novelty, occupying the same position with regard to *C. Warszewiczii* as *C. labiata Reineckiana* does to *C. Mossiae*. It came out of the importation by Messrs. F. Sander & Co., now generally known as *C. Warszewiczii Sanderæ*, and which has produced such fine novelties lately. *James O'Brien.*

ORCHID NOTES AND GLEANINGS.

CATTLEYA GRANULOSA DUBUYSSONII.

From the gardens of C. Mitchell, Esq., Jesmond Towers, Newcastle-on-Tyne, Mr. T. J. Wheeler, the gardener, sends for name the finest form of this variety which we have seen. Its broad, wax-like, clear, pale yellow sepals and petals measure over 6 inches across. The side lobes and isthmus of the lip are orange-colour, the front lobe white, tinged and veined with rosy-purple. There are a few small purple dots on the segments. It is a yellow and nearly unspotted form of *C. granulosa Schofieldiana*, and a very ornate flower.

REARING OF CITRUS AND DECIDUOUS TREES FROM SEED.

A CAPITAL little pamphlet has recently issued from the pen of B. M. Lelong, secretary of the Californian State Board of Horticulture, on the rearing of Citrus and deciduous trees from seed, budding, grafting,

and appliances, of which we give a few extracts on the growing of seedlings.

APPLE.

In France there are numerous orchards of seedling trees bearing common fruit. This fruit is sold there to the growers at very low figures, and the cheapness of labour and other conditions being equal, many have emerged into the business of raising seedlings for the export trade.

Apple seedlings are propagated from seeds obtained from various kinds of Apples having an abundance of seeds, and while the windfalls and culls can be used for this purpose, it should be borne in mind that such fruit must be matured fruit, as the kernels in the seeds of immature or undeveloped fruit are generally only half developed, and only a small percentage grow, and those that do grow do not make thrifty stocks.

The well-ripened fruit nearly always contains plump seeds, and their producing a thrifty tree is borne out by the fact that the seedlings from such seeds are always the largest trees in the nursery or seed-bed, while those from half-grown, unripe, or undeveloped fruit generally remain small and very slender, requiring at least another year's growth before they attain the size of seedlings (of one season's growth) from plump seeds of ripe and developed fruit.

The Apple pips are planted in February or March, and there are several requirements that should necessarily be observed, as the ones following, and they should not be lost sight of if one wishes to succeed in germinating Apple seeds:—

Seeds that have been allowed to become dry are put into a sack and then immersed in water, and allowed to remain therein (sack and all) for four or five minutes; the sack is then strung up, to allow the water to escape. This operation is repeated several times for two or three days, or till the seeds have begun to swell; then they can be planted, and the soil must not be allowed to become dry. In the East, they throw the seed, when it has been allowed to become dry, into boiling water, then turning quickly into cold water, repeating the process two or three times, until the hard shell is softened. Apple seeds that have been allowed to become dry, when treated in this way will germinate in a few days after they are planted. Great care should be exercised in this operation; it does not mean that they should be left in the water till the heat destroys their germinating power, but by a short quick scald and sudden cooling the heat does not have time to reach the germ. After a season's growth the plants or seedlings are large enough to transplant into the nursery.

CHERRY.

The seeds from the Black Mazzard Cherry produce the best stocks for raising standard Cherry trees. The raising of Cherry seedlings is not very difficult, yet to be successful it requires considerable attention, and the following of details closely. Cherry seedlings do not grow as rapidly as the Peach or Apricot, and the plants are seldom budded until the second year's growth. The fruit is collected when fully ripe, and the pulp washed off; the pits are soon thereafter placed in boxes, covered with alternating layers of sand, and thus kept until spring, when they are planted in well-prepared seed-beds, or in nursery rows. If the pits, after being washed from the pulp, are to be shipped to a distance, they should be dried in the shade for a few days, to prevent moulding, but the drying process should not be continued too long, as exposure to air will lessen or destroy their power of vegetation. Cherry pits start very early in the spring, and should be planted in February, as soon as all signs of frost are over, and the ground begins to get warm. The season following, the plants may be transplanted to permanent rows in the nursery.

Dwarf Cherry stocks are not extensively used in California, but in some sections they are preferred. For dwarf Cherries the seeds of the Mahaleb are used. The Morello stock is also considered very good, and even hardier. Dwarf species are somewhat difficult to bud into; the operation is most

successfully performed late in summer, just as the stocks begin to relax in growth.

CITRON.

The Citron is propagated from seed and by cuttings. The seed is planted and treated in the same way as Orange seeds. The plants grow more rapidly than those of the Orange or the Lemon, and the plants can be budded the year following. The Citron grows and does well on Orange stock, and this is the most profitable way to grow them. The practice of propagating the Citron by cuttings should be discontinued, because the Citron roots are subject to the attacks of gum disease, and sooner or later the disease develops in the stocks, and the death of the trees is most certain.

FIG.

The Figs grown in California seldom contain fertile seeds; the kernel is lacking, and therefore their planting should be avoided. The imported Figs possess fertile seeds, and nearly all germinate. The Figs are broken open with the hand, and the seeds washed out in warm water; they are then spread out on a piece of paper or board for a little while to dry, or, rather, for the moisture to leave them. These are sown in April, in well-prepared shallow boxes. The plants are taken out of the boxes after the second year's growth, and planted in nursery rows.

LEMON.

The lemon seed is planted, and receives the same treatment as the seed of the Orange. The raising of Lemon seedlings, however, is not practised, because the stocks are subject to gum disease, and for this reason have been discarded. However, Lemon stocks grown from seed make better trees than those propagated by cuttings. The roots are somewhat healthier, but neither are recommended.

The Lemon is budded on the Orange, and grows thriftily, and becomes a prolific bearer. The Orange stock is less liable to gum disease, and does not influence the top to any extent as to be noticeable in the fruit. At first the Lemons will be inclined to be roundish, but as the trees grow older will assume their elongated shape.

The Orange stocks are much hardier, and more able to support the heavy weight of the fruit and foliage. The Lemon grows readily from the cutting. The cuttings are planted in early spring and through the summer. The smaller the cuttings the better, but they should not be too small. The wound in small cuttings soon heals over, and they make healthier trees than those from large cuttings, but in either case they are short-lived, and should not be planted.

LIME.

The Lime is very easily propagated from seed. The seeds always germinate without much difficulty.

The fruit is placed in tubs or barrels to rot, and then is washed out, preserved, and planted the same as orange seeds. The plants are transplanted the season following.

The seed-bed or boxes must be well protected from frost, as the plants are very sensitive, and on account of their being so susceptible to frosts, the Lime is not grown successfully excepting in warm belts and sheltered localities.

The Lime comes true from the seed; the seeds "sport" only in exceptional cases. *J. J. Willis, Harpenden.*

(To be continued).

TRING PARK, HERTFORDSHIRE.

(Continued from p. 131.)

THE ORCHID-HOUSES and their choice occupants have been frequently noted by us; a hasty survey on the occasion of our last visit showed that none of the subjects for which the gardens are famed have been allowed to degenerate.

The planted-out specimens of *Vanda teres* having made a grand show, have just been replanted, and never looked better. In the house of *Phalænopsis*, some

of the plants having foliage of great size have been cultivated in these gardens successfully for so many years, that they demonstrate the fact that there is nothing in the plants themselves to render them unmanageable. Mr. Hill says that, beyond keeping them in an even temperature at all seasons, and watching every day for the signs of thrips, there is little difficulty in growing these Moth Orchids. In another warm division are some fine *Cypripediums*, and notably, *C. Rothschildianum*, and overhead are suspended many plants of the last lovely, sensational Orchid, *Eulophiella Elisabethæ*. It may be as well to emphasise the fact that the Tring Park plants of it are growing well, suspended in a warm house, and kept tolerably wet, as with a new plant it is useful to know one way in which it will thrive. The plants of *Vanda cœrulea*, which on the occasion of our last visit were so thickly set with fine blue flowers, are in a more prosperous condition than long-cultivated plants of the species usually assume, for although some grow it very easily, by far the greater part of growers fail. Too much sunlight in summer seems bad for it, and it likes to be in a warm house which is damped down and nearly shut up entirely early in the afternoon while the warm weather lasts. The *Lælias* and *Cattleyas* are vigorous in growth, but at present with little flower.

One of the houses contains a large number of plants of *Cattleya aurea*, among which are the original *C. aurea marmorata*, *C. Hardyana*, and the typical *C. Warscewiczii Rothschildiana*, one of the most beautiful and distinct of *Cattleyas*. Among plants in flower in the intermediate-houses we remarked some of the fine yellow *Sobralia xantholeuca*, one of the beautiful pink-tinted *S. Lucasiana*, the carmine-coloured *Broughtonia sanguinea*, &c. A house of *Dendrobiums*, growing well, came next, and then the cool-houses, in which the *Odontoglossums* were very thriving, and sending up some spikes, to mingle with the showy lot of *Disa grandiflora*, &c., in bloom. Here, too, was remarked a plant in flower of the pretty scarlet *Lælia monophylla*, and also some of the brightly-coloured *Cochlioda vulcanica grandiflora*.

Among the plants well in bloom we observed a very showy houseful of *Celosia pyramidalis* and tuberous *Begonias*; a large quantity of a very fine strain of *Vallota purpurea eximia*, which have given and are still giving a grand lot of flowers; a small batch of the showy *Hæmanthus Katherinae superbus*, and preparing for bloom later; a pitful of *Nerine Fothergilli major* is at present just in the right condition. Many other striking things also appeared, but we noted only the more prominent. Among the best examples of culture are the thousands of *Carnations* for flowering in pots, a large lot of which will be available from autumn onward.

COLONIAL NOTES.

BOTANIC STATIONS.—One of the most useful works accomplished in the West Indies and other colonies of late years has been the establishment of Botanic Stations in various localities. The designation is, perhaps unfortunate, as leading to the inference that the gardens in question are of a purely scientific character, whereas their main object is the introduction and cultivation of economic plants best suited to the conditions of each locality, and the diffusion of useful information among the planters and settlers. These stations are in connection one with the other, and with Kew. It is owing to the forethought and energy of Mr. Morris in particular, that these establishments have been founded. His experience in Ceylon, Jamaica, and now at Kew, renders his assistance in this matter highly valuable, and aided by the staffs of the several establishments will doubtless lay the foundation of an era of prosperity. Of the older West Indian gardens of Jamaica and Trinidad, we have occasionally the opportunity of speaking, and now, through the kindness of Mr. C. A. Barber, the Superintendent of Agriculture, we are in a position

to make mention of some of the embryo establishments under the general supervision of that gentleman, referring the reader for fuller details than we give to the *Leeward Islands Gazette*.

DOMINICA.

The founding of the Botanic Station in Dominica will probably, in future years, be referred to as one of the greatest strides in the progress of that island during the present period.

Admirably situated within the Tropics, with a broken and varied surface, with its sheltered valleys and steep mountain sides, Dominica possesses a lovely flora, only limited in extent and variety by the size of the island, and its distance from any large continental mass. And the same characters which render it the El Dorado of botanists mark it out as a peculiarly suitable home for all the minor and profitable industries in Tropical Agriculture.

The population, somewhat under 30,000, is small for the size of the island; and not much more than one-tenth of the island is under any manner of cultivation.

It is needless to point out the necessity, in such a land, for a well-organized depot, by whose help plants suited to the soil and climate may be introduced, grown experimentally and distributed broadcast at nominal prices; while the experienced gardener at the head of it will become the centre of information concerning the best methods of propagating, growing and treating these plants.

The site selected for the Botanic Station in Dominica is not all that could be desired. As a general rule it has been very properly thought desirable that, where new and beautiful plants are being grown, they should be placed within reach of the towns where the population is concentrated. But the real purpose of a botanic station has too frequently been lost sight of, and the attempt to combine a public recreation-ground with an acclimatization garden has crippled the work of the more useful and less ornamental character. Such has, without doubt, been the case in Dominica.

The Botanic Station lies at the back of the town of Roseau, on a slightly-elevated land, about half a mile from the sea. Its situation is romantic. Immediately to the east rise the steep cliffs of Morne Bruce to a height of 500 or 600 feet above the sea level. Paths cut along the sides of these cliffs form delightful shady walks while the sun's rays are still in the east; and the planting of Bamboo clumps and shade-trees, along their edges, will render them equally enjoyable during the latter part of the day. The station lies mapped out below; and as plot after plot is being brought under cultivation, and new roads and beds are being laid out, the appearance of the whole, from this point of view, is attractive in the extreme. To the distance, a fine view of Roseau and its roadstead is spread out, while, round to the right, picturesque glimpses may be had up the Roseau valley.

Judging by the present rate of progress, it is reasonable to assume that in a few years time, when the ornamental trees have shot up, and the Bananas upon the station have given place to various economic plants, the botanic station in Dominica bids fair to become one of the most picturesque in the West Indies.

The land has been laid out in plots, and various economic plants are being grown. The presence of great numbers of Banana trees has been made use of in starting the young plants. Each plot is 110 feet square, and the parting hedges are formed of the physic-nut (*Jatropha Curcas*) on which it is intended later on to grow *Vanilla planifolia*. Liberian and Arabian Coffee, different kinds of Cacao, Cinnamon, Limes, Chinese Ginger, Oranges, Tangerines, Mulberries, Lemons, Musk-ochro, Rubbers, and various other economic plants have been placed in these plots; and the walks between have been lined with Pine-apples of various kinds, Egyptian cotton, Nutmegs, and different ornamental plants. A few plots of fibre plants have been laid out further toward the north; and it is intended in this direction to make use of a barren slope as a fibre garden, with plots of all the fibre plants likely to be of use in the Leeward Islands.

The lower slopes beneath the cliff are at present in Bananas, Cacao and Limes. A gradual improvement of this part of the garden is intended as time proceeds; but a good deal of this land is very dry and stony, and there is at present no means of irrigation. Along the upper slopes a quantity of Guinea Grass has been planted.

At the junction of the three roads, a wide space has been left, in which an ornamental pond might be placed. A circular basin of water with the Victoria Regia and various other kinds of Water Lilies, surrounded by shade-trees and sheltered by clumps of Bamboos, will form an exceedingly attractive central object; and when the trees already planted have begun to make headway, there will be avenues in three directions leading towards the principal gates.

The gates, of which, at present, only one has been erected, are much needed. Cows and calves, sheep and goats, are at present tethered at different points on the uncultivated land; but it requires the Curator to be constantly on the alert to prevent the abuse of this privilege. On a recent visit, I came across a goat tethered to the upright leafy spike of a young royal Palm, and at the same time a fine specimen of *Caryota urens* was pointed out to me as having been eaten down by a cow which had strolled through one of the gates in passing.

It is a matter of great importance to the welfare and utility of the station that a suitable office be erected for the Curator pending the building of his house. Such an office should contain the books of the Curator, the rudiments of an economic reference library, and the herbarium, with a set of woods and dried plants of the island. It should be beautified by the training of creepers over it, and would form a pleasant shelter and place of rest for visitors during the heavy showers which sometimes surprise one in these islands.

MONTSERRAT.

The small Botanic Station in Montserrat lies to the south of the town of Plymouth, and comprises a strip of land a quarter of an acre in extent along the base of the cliff. The public road runs through the station, but the small piece of the garden between the road and the sea is given up to various experiments in raising a protecting belt against the sea-blast. Several of the trees formerly upon the land have been left standing, and under their pleasant shade the plant-beds and small office have been erected. The general appearance of the station is attractive; and from the number of names found in the visitors' book, it appears to be an exceedingly popular institution.

The soil of the garden is of a light and sandy character, and is unfitted for many classes of cultivation. It is, however, being steadily improved by planting and the addition of manure. The water supply is fortunately abundant, and to this fact the success of the station is, in a great measure, due. The site is, however, much exposed to the westerly breezes, which, when they blow, cause great destruction among the shrubs, frequently completely stripping them of their foliage. With the completion, however, of this somewhat tardily-growing shelter-belt, and the continued addition of ordinary farmyard manure, the best results may be anticipated. There are a number of stock farms in the south of the island, from which a cheap and continuous supply of manure may be obtained. The one permanent drawback to the station appears to be its exceedingly contracted area. There is at present practically no room for experiments with new economic plants, and thus one of the primary objects of a botanical station is in danger of being overlooked.

Mr. Joseph Wade, the Curator, entered upon the land and cleared it of scrub in November, 1890; and great praise is due to him for the thoroughness with which he has cultivated the small area at his disposal. The beds are at present devoted to different kinds of vegetables. It has been the curator's wish to spread the knowledge of such cultivations among the poorer classes, and fine specimens of Tomatoes, Lettuces, Cabbages, Cucumbers, &c., have been grown. A somewhat disproportionately large area under Pine-apples has also yielded some excellent fruit. The ground is not yet suited for Cacao, Nutmegs, Liberian Coffee, or Spices; but a few Bananas, Nutmegs, Loquats, &c., are planted under the shade of the larger trees, and are doing fairly well. A number of good kinds of Vines and Turkey Figs have been procured from England, and it is intended to make some trials with these fruits. Now that the success of English vegetables has been fairly demonstrated, it is desirable that more attention be paid to ornamental shrubs and other branches of horticulture; and also that a few experiments be made in the growth of economic plants, such as Cotton and Tobacco.

(To be continued.)

NOTES FROM THE ROYAL HORTICULTURAL SOCIETY'S GARDENS, CHISWICK.

HERBACEOUS PERILOXES.—Severe drought does not agree with the herbaceous Perlox, but the collection in the Chiswick gardens is flowering fairly well. The dwarf type of Phlox is getting grown more freely each year, and amongst the many varieties, mostly of French origin, occur beautiful colours. But the great point is their dwarf and compact, not to say bushy habit of growth, which makes them of the greatest value for grouping or forming dense masses, either of distinct or several colours. We noted a few very fine kinds in bloom, and they are as follows: Independence, very dwarf, the flowers produced in large heads, each individual bloom large and pure white. A mass of this, backed up by dark-coloured leafage, would look well. Gen. Chaver, brilliant red, is just as free a bright colour, that keeps its colour well, in spite of fierce sunshine. John Laing, purple magenta, and Eugene Danganvilliers, are two good kinds. One of the finest in the collection is the latter, and represented by several specimens. It is a sturdy grower, the individual flowers large, light mauve in colour, with a white eye. If only one were chosen, we should select this. Gen. Faidherbe, brilliant red, is a free and excellent variety for its effective colour. Mrs. Keyes is rather taller in growth, the flowers large and white touched with mauve. Protei is also large, white suffused with purple. Purité is creamy white, a distinct, pleasing flower, free, and the habit of the plant dense and strong. Nain Bébé has a large purple flower, and Graham W. Culloch, intense crimson; they are small, but very rich in tone. One of the more distinct in the salmon-coloured varieties is Adonia, a clear and delightful shade. Too many purples are not wanted, nor the magenta shades. They get very dingy in the sun. Of course the dry weather has induced dwarfness of growth in most plants, but all the kinds mentioned are naturally of short stature. *F.*

DEUTZIA PARVIFLORA.

AMONG the many interesting plants exhibited at Ghent in April last was the Chinese shrub of which we now give an illustration (fig. 31, p. 153). It was exhibited by M. Lemoine, of Nancy, to whom we are indebted for the photograph whence our illustration was taken. The plant is quite hardy, even at Nancy, and its flowers expand earlier than those of any other species, on which account it is well suited for forcing purposes.

The general appearance is sufficiently indicated in the accompanying figure, which shows how freely the flowers are produced in close terminal panicles. The flowers themselves are creamy-white, the petals cup-shaped, as in a *Cratægus*. The plant was introduced into European cultivation by Professor Sargent, who distributed specimens from the Arnold Arboretum to the Jardin des Plantes. The species was originally described by Bunge, whilst Regel figured a variety of it under the name *Amurensis* in *Garten Flora*, 1862, t. 370. The same, or a closely-allied plant, occurs in the Himalayas from Kashmir to Bhotan (see Hemsley, in *Journ. Linn. Soc.* vol. xxiii., p. 276, where the full synonymy is given). In the *Flora of British India* the Chinese plant is doubtfully referred to *D. corymbosa* by Mr. C. B. Clarke. Now that the plant is in cultivation, an opportunity will be afforded of settling these doubtful questions.

REMARKS ON THE FRUIT CROPS OF 1893.

[FOR TABULATED SUMMARY, SEE P. 89.]

(Continued from p. 126.)

7. ENGLAND, N.W.

LANCASHIRE.—Fruit crops in this neighbourhood are quite up to the average. Some kinds, such as Gooseberries, Cherries, Currants, and Apples, rather over the average. Owing to the long spell of dry weather, Apples, Pears, &c., will be rather small. Strawberry were very fine, but soon over. Peaches on outside walls are an excellent crop, and very early, but the red-spider is very troublesome. *J. Hathaway, Lathom, Ormskirk.*

—The Apple crop is a heavy one, and the trees as a rule have escaped the attacks of insect pests. Pears are also a good crop, except on walls. Plums have been much blighted in places, especially Damsons, and the unusually heavy set of fruit has been much reduced, but a good crop is still left. Morello Cherries are loaded, but the trees have suffered for want of water, and the fruit is ripening prematurely, and will consequently be small. Other Cherries were good. Gooseberries are a heavier crop than usual, but caterpillar and red spider have ruined the trees in places. Had heavy showers on the 9th, 10th, and 11th. *Wm. P. Roberts, The Gardens, Cuckden Hall, Preston.*

8. ENGLAND, S.W.

CORNWALL.—This is the twenty-seventh season that I have experienced here, and I find this to be the most exceptional during that period—in fact, we have witnessed the longest drought on record, for four months we have only had occasional showers. These dry and sunny summers always anger well for fruit and other crops in this neighbourhood, where the soil is loam and deep; unfortunately, these abundant seasons only average one in six years (Jubilee to wit, 1887). It is surprising to see such fine fruit and the weather so dry. Strawberries were a month earlier, so also is nearly all kinds of fruit. Rivers' Early Plums are over, so are Doyenné d'Été Pears and Alexandria Peaches; such Pears as Bauré d'Amanlis, Pitmauton Duchess, Iluysh's Victoria, Bergamotte d'Esperein, Napoleon, Chaumontel, Bauré Giffard, and Swan's Egg, are giving heavy crops; the following Apples are bearing heavy crops, Monster Pippin, Early Bowhill, Cox's Orange Pippin, Blenheim Orange (especially trees twenty years old in orchard), Kerry Pippin, Wellington, Keswick Codlin, King of Pippins, &c. *Chas. Lee, Bacoconnoc, Lostwithie.*

CORNWALL.—The Apple crop, although severely thinned by the long period of hot dry weather, is still, in this neighbourhood, greatly in excess of average, and is now swelling satisfactorily. A great proportion of the Pears has dropped, yet a good average remains. Peaches and Nectarines are very plentiful, and though small, very good. The earliest Strawberries

The crops of small fruits are enormous. Strawberries did well on the flat, on sloping ground they were dried up. Raspberries, where mulched and watered, have given fine fruit, and plenty of it. *Geo. Baker, Membrand, Plymouth.*

DEVONSHIRE.—The weather throughout the season

rainfall. Apples, Pears, &c., which before had threatened to be under-sized, are now showing up well under its influence, and now give promise of fine development. Strawberries had a long season, and were of excellent size and quality. *James Eastone, 38, Temple Road, Exeter.*

DEVONSHIRE.—Apples and Pears do not flourish here, although they make good growth, the sea fog in autumn preventing the wood ripening properly, and so it dies back considerably. The fruit of Pears, in most instances, swells but very little, and cracks very much before they ripen. Peaches do no good out-of-doors, and must have glass protection. Raspberries, black Currants, and Morello Cherries crop prodigiously. *J. Ollerhead, Rousdon.*

— The promise of fruit of all kinds in the spring was the best on record. The long spell of dry weather told on many kinds, and on some of our light soils caused the loss of nearly all the crops. Strawberries were excellent with me up to the last. Raspberries, though most promising, suffered most. The Apple crop was being lost up to the time the rains came. All wall trees on south, east, and west borders were obliged to be constantly watered. I never before saw trees so much affected by drought. Apples and Pears now promise to be fine. The crops of Pears are everywhere enormous. *D. C. Powell, Powderham, Exeter.*

— Strawberries were gathered generally out-doors on May 1, and the gathering lasted till the middle of June, it being, on the whole, the best season we have ever had. Laxton's Noble was grown for early work, but it is quite useless for marketing after Vicomtesse H. du Thury and other of the better varieties come into bearing, the fruit being soft, and ill-adapted for carriage. Sir Joseph Paxton is the variety that is most extensively grown in this part, and the most profitable. We gathered Pear Doyenné d'Été on June 12, nearly three weeks earlier than usual. Early Rivers Plums were ripe on June 20, and the last fruits were picked July 8; several other varieties were gathered in the week ending July 22. The Mr. Gladstone Apple was ripe in the last week in June, from a pyramid, the crop on this tree numbering about 500. This is a capital early dessert App'e, and, if grown in quantity would greatly affect the price of foreign Apples at this season. Red Astrachan Apples were gathered, of full size and perfect in colour, a fortnight ago. I find that this variety cankers very much in most situations. Of the early culinary varieties of Apples many of them are nearly of full size—I mention Lord Suffield, Lord Grosvenor, and Ecklinville Seedling—while all the others are swelling away, and promise to be an excellent crop. The fruit, at the present time, is larger than it was at the end of August last year [But will it keep so long? Ed.]. Cherries were gathered very early in the month of May—a fortnight earlier than usual; Apricots the same, which are carrying unprecedentedly heavy crops of fruit. *South Devon.*

GLOUCESTERSHIRE.—Owing to the excessive heat and long drought, all fruits are about a month earlier than usual. Fruit trees when in flower were magnificent, but the bloom lasted only a few days. Codlins generally have set well, although a great many of late have fallen off, and the remainder are small; some of the popular fruiting varieties have failed altogether, and in some instances the trees have perished. Pears are very scarce—only here and there is a tree seen with a fair crop of fruit. Early Prolific Plum has an abundant crop; other varieties only a few. Apricots, Peaches, and Nectarines, although a heavy crop, are very small. Gooseberries and Currants have been plentiful. Strawberries were an average crop—generally small fruit. *Herbert Noble, Ashton Court Gardens, Bristol.*

— Apples in this district set a very heavy crop, but on a light sandy soil many have fallen off, nevertheless the crop is good. Pears were never better; they are bright, clean, and most promising. Cherries are somewhat smaller than usual. Peaches and

FIG. 31.—*DECUZIA PARVIFLORA.* (SEE P. 152.)

were fine and good, but the later crops soon over. Bush fruits of all kinds most abundant and excellent. *James Murton, Pencalenick, Truro.*

DEVONSHIRE.—The Apple crop in this district is very good; many dropped owing to the drought—on most trees over plenty are left. Pears are mostly doing well. Cherries are a heavy crop, and clean.

favoured the fruit crops so entirely, that all kinds are much beyond average, stone-fruits especially. From the beginning of March to the end of June was an unbroken period of evenness of temperature, absence of storms and of frosty nights, and withal, bright sunny days. Cherry, Apricot, and Plum, especially, are large crops, and such as are rarely seen. Within the past fortnight (July) there has been considerable

Nectarines were never better where the trees have been properly cared for, and the fruit thinned out. *Thomas Shingles, The Gardens, Tortworth.*

HEREFORDSHIRE.—A magnificent bloom on all kinds of fruit trees in spring, followed by one of the driest seasons on record, and one of the worst attacks of insect pests for many years, has resulted in a very poor crop of Apples, Pears, and Plums. Apricots are a heavy crop and good. *Thos. Spencer, Goodrich Court Gardens, Ross.*

MONMOUTHSHIRE.—I do not remember fruit crops generally flowering more freely here than they did this spring, and were it not for the frosts we had on April 12, 13, 14, which injured Pears and Plums, I might record the best crops we have had in our low situation; and as it is, taking them collectively, they are a good average. Of Apples, Blenheim Orange, Hornead Pearmain, Tom Putt, Warner's King, and Forge are cropping heavily; and of Pears, Beurré d'Amanlis, Clapp's Favourite, Doyenné du Comice, Durondeau, Louise Bonne of Jersey, and Doyenné de Merode are good as cordons on an east wall, while Beurré Diel, Beurré Rance, Beurré Superfin, Brockworth Park, Flemish Beauty, Marie Louise, Ne Plus Meuris, Pitmaston Duchess, and Williams' Bon Chrétien are the best as large trained trees. Plums are almost a failure with us, although on higher situations near they are fairly good. Apricots are good in quality, as are Cherries. Bush fruits are plentiful and good, particularly Currants and Gooseberries, Raspberries being lighter in crop than usual, while Strawberries were good in every way. Scarlet Queen is both good and very early. Noble was also unusually fine upon a south border. We have mulched and watered liberally, and this, together with our heavy, cool, and deep soil, has enabled the trees, &c., to withstand the drought well. Nuts of all kinds are abundant. *Thomas Coomber, The Hendre.*

SOMERSETSHIRE.—Far better crops than anticipated. Severe frosts, experienced when very many of the kinds were in flower, not doing much harm. Apples too thick on old trees, and are very small accordingly. Pears on some walls plentiful enough, also large and well-formed; in the open, very scarce in some gardens, ours included, and abundant in others. Peaches, Nectarines, Apricots, Cherries, and Plums (on walls), abundant and good. Strawberries injured by frost, and in some instances spoiled by excessive heat and drought. *W. Iggulden, Marston Gardens, Frome.*

—The year of 1893 will be remembered for many years from a fruit point of view, everything coming so unusually early—in our garden some things a month. The drought was terrible, over four months with but just a few showers. Gooseberries were terribly infested with the caterpillar. Apricots have an enormous crop and fine, and the trees clean. Plums very good, especially Jefferson and Coe's. Apples, of the Codlin class, very clean and early. *J. Crook, Ford Abbey, Chard.*

—The spring this year was favourable for all kinds of fruit; there having been scarcely any frost or rough wind, the fruit set well, and we have in Somerset, as far as I have travelled, on the whole, a crop above the average, especially of Apricots, Plums, and Pears. *W. Hallett, Cossington House Farm, Bridgwater.*

WORCESTERSHIRE.—The Apple crops are, on the whole, under average, and extremely partial—unaccountably so; now and then heavy crops on trees, then whole plantations nearly barren. Severe frosts whilst in flower, accompanied by a dry arid east wind. Choice Pears on pyramids and walls suffered severely from the larvæ of the gnat-fly (*Diplosis pyrinosa*), which lays its eggs in the buds and blossoms. This is the most perplexing insect we have ever had to deal with; how to combat it in future is a serious question. Stone fruits of all kinds abundant and good, although the extreme drought and aridity of the atmosphere kept them under-sized. Alexandra Peaches were gathered out-

doors on June 21, and Strawberries (Noble) on May 15. Bush fruit suffered from drought, and Gooseberries attacked by red-spider. *W. Crump, Madresfield, Malvern.*

WORCESTERSHIRE.—Taken altogether, our fruit crop is the heaviest we have had for some years; the trees, too, are clean and healthy, and the fruit is colouring up nicely. Apples and Plums are an exceedingly heavy crop, also all bush fruits; but from the extreme heat and drought, they have ripened fully three weeks earlier than usual. *W. Child, Croome Court, Severn Stoke.*

WALES.

ABERYSTWYTH.—The fruit crop on the whole is very good. Apples are a heavy crop, at one time they were suffering very much from the drought and beginning to drop, but recent rains have saved them, and they are swelling fast. All small fruits were very heavy crops. Birds are very troublesome this year through the scarcity of insects occasioned by the drought. *R. C. Williams, Crosswood Park.*

DENEIGHSHIRE.—Generally speaking, all crops have been plentiful and of good quality, although by this exceptionally abnormal season much forced, especially black Currants and Raspberries, which were soon over. Noble Strawberry is an excellent dry-weather variety; Sir Joseph Paxton has done good service. Codlin varieties of Apples are a heavy crop; the Pippin class are also good crops. Trees of Red Astrachan, Hawthornden, and Greening Apples have good crops. The early Pears are a thin crop, whilst late Pears are a good one. Sweet Cherries were never better, but Morello suffered from the great heat. Apricots were never better here. *P. Middleton, Wynnstay Gardens, Ruabon.*

FLINTSHIRE.—Apples on old standard trees and Plums and Apricots are much above an average crop. Here as elsewhere the drought wrought much injury to small fruits, and insects were abundant. *James Barnard, Mostyn Hall Gardens.*

GLAMORGANSHIRE.—All kinds of fruit are from four to five weeks earlier than usual in this district, and in cases of an insufficient water supply, the fruit undersized. Red-spider is very prevalent in some gardens, especially on the Gooseberry bushes, in some instances killing them outright. Taking the whole fruit crop of the district, it is much over the average. Cooking varieties of Apples were ready for use on June 20. The Pear trees are very healthy looking, as are Peaches and Nectarines. Our Strawberry crop was the finest and best I can remember. All small fruits most plentiful, but lacking in flavour hitherto. *R. Milner, Penrice Castle, Swansea.*

—All kinds of fruit trees flowered to excess this year, from a fortnight to three weeks earlier than usual. The weather was favourable during the time they were in flower, and the fruits set well, and swelled away freely, until the trees began to feel the effects of the drought, when the Apple trees got covered with red-spider, and the fruit began to drop off in great quantities, and they have continued to drop, more or less, ever since, although many of them are more than half-grown. *A. Pettigrew, Castle Gardens, Cardiff.*

9. IRELAND, N.

ARMAGH.—The Apple crop will be heavy and good in this district; the fruit is swelling fast, and will be ripe much earlier than usual. Pears are a good crop, and the fruits large for the time of year. Plums and Damsons set very thickly, but many dropped off. Still a good crop remains. Cherry trees suffered very much from dryness of the soil, but the crop of fruit was a good one. The Raspberries are a very heavy crop, but the fruits small. Black Currant bushes are badly blighted, whilst red Currants have good crops of small berries. *Thomas Sheasby, Castle Dillon.*

GALWAY.—Fruit crops were never finer or more abundant than those of the present year; the season for Strawberries was short when compared with other years, the great heat ripening the whole

crop in the course of a few weeks. Small fruits were all fine, and a very heavy crop. Morello Cherries are a heavier crop than other varieties, and the fruit of a very fine size. Apples and Pears are a grand crop, and the fruit much larger than I have ever seen them at this date. *John Cobban, Garbally, Ballinasloe.*

CHANNEL ISLANDS.

JERSEY.—Apples are abundant this season. Pears promise to be a fair average crop. Apricots are plentiful. Cherries hung in wreaths upon the branches of the trees, and ripened well. Peaches and Nectarines are a fair average crop. The Early Amsden Peach ripened in June, and Early Louise is ripe; the later varieties look healthy and well. Of early Strawberries, Laxton's Noble particularly were abundant and good, but the later varieties were stained and scorched by the continuous heat. Gooseberries and Currants were good, but Raspberries could not hold out, for want of moisture. Medlars look well, and Mulberries promise to be fine. Out-of-door Grapes will be indifferent, but indoor crops look well when properly cared for. *Charles B. Saunders, St. Saviour's.*

ISLE OF MAN.—The Strawberry crop ripened fully three weeks before the average time, and I may say the same of other kinds of small fruits, which have been very fine, especially Gooseberries and Currants. Apples and Pears would have been above the average had not long drought seriously affected them, a great many dropping off the trees. *Jas. Murphy, Cronkbourne Gardens, Douglas.*

FLORISTS' FLOWERS.

THE CARNATION AND PICOTEE.

A MONTH ago I wrote upon the Carnation and Picotee, and now that the National and other Societies' Exhibitions are passed, a few more remarks may be of use to my readers. The flowers were quite three weeks earlier than usual, and all the crown flowers passed out of bloom on July 11. The growers in the Midland Counties, who were able to cut crown-blooms, had an advantage over the southern growers, in being able to exhibit larger blooms. The leading feature at the Chiswick was the collection of seedlings exhibited by M. R. Smith, Esq., Hayes Common, who has given special attention to border varieties of the Carnation, and been successful beyond precedent in raising beautiful varieties, and who finds in his gardener, Mr. C. Blick, an excellent cultivator. It must not be supposed that such flowers can be produced without trouble; and those who go home and think that, by merely planting their Carnations in the garden, without any preparation of the soil, similar results will be produced, may find themselves mistaken when it is too late. All kinds of soils are not suitable for the culture of the Carnation, although it is about as accommodating in this respect as most garden favourites. I allude to the preparation of the soil at this time, because I have been making preparations for planting out seedling Carnations. It is trenched about 18 inches deep, and a dressing of rich manure is worked into the soil as the work is being done. If our plants, flowering this year, had not been planted in well-prepared soil, their flowering could not have been satisfactory. Besides the preparation of the soil, attention must be given to the plants after they have been planted out; frequent hoeing to kill weeds, and loosen the surface, hardened by rains, is a necessary part of their culture. During the last few years the plants have been attacked by the Carnation-maggot, which eats into the heart of the plants, and is not easily detected before much mischief is done. Named varieties raised from layers or cuttings require quite as much attention as seedlings, and to obtain well-developed flowers, such as are seen at exhibitions, this preparation of the soil is very necessary, and when the plants are intended to be planted before the winter, the ground should be prepared with as little delay

as possible. I began the layering business on July 12, and the layers will be sufficiently rooted to plant out by September 12; the plants will be all the better if the ground can be prepared for them six weeks previously, the exposure of the soil having a beneficial influence upon the well-being of the plants to a greater degree than is generally supposed. Very light soil over gravel is not well adapted for the Carnation, but even this kind may be improved by adding good yellow loam to it. A clay soil is not much better adapted for them, but this can be improved by well draining it and adding wood-ashes or burnt earth. The best kind of soil is a clayey loam, rather inclining to light than heavy. Instructions as to layering were given at p. 744, and no delay should take place in finishing this work, as the sooner the layers are pegged down, the better will the plants be rooted.

Fertilising the Flowers.—This operation, with the intent of obtaining good crosses, should be attended to where the flowers are still in good condition. Those who have beds of seedlings flowering for the first time should daily look over the plants and mark all the varieties that seem to be of merit. This is a job which requires much consideration, and a careful comparison of the seedling blooms with flowers of the best named varieties in the same class, and unless there is some superiority in the seedlings, it is scarcely worth while growing them a second year. All the varieties intended to be grown again should be layered at once.

Tree or Perpetual-flowering Carnations.—These varieties are now in preparation for the winter, and the best place for them at present is a fully-exposed position out-of-doors, as, if kept in frames, or crowded in some out-of-the-way corner, where direct sunlight does not reach them, and the air is almost stagnant, they are sure to become a prey to green-fly, and other insects. In fact, with all the care I have been able to bestow upon our plants, they have required frequent dipping in a mixture of soft-soap and rain-water, to destroy the insects infesting them. The plants should not be over-potted, but it is quite as well to give them sufficient pot-room, in order that they may be able to develop full-sized blooms. Pots of 6 and 7 inches in diameter are sufficiently large for plants which were propagated last spring. It is not well to grow too many varieties, but rather a large number of plants of a few varieties, but of distinct colours. Winter Cheer is a very fine and distinct dwarf variety, with scarlet-coloured flowers; Madame Carle produces very freely flowers of pure white, but not of large size; the flowers of the variety Mrs. Moore are also pure white—they are of large size, but not freely produced; Miss Joliffe Improved produces larger flowers than the original Miss Joliffe, and is the best of the pink-hued varieties; Mrs. Treen is a good crimson-coloured variety, as also is Mrs. A. Hemsley. See that the plants do not suffer for want of water, for if they once receive a check, the chances are that they will not start into free growth again. Cleanliness and careful watering are all that the plants require until they are taken under glass at the end of September.

PINKS.

Instructions were given to take the pipings of these about the third week in June, and if they have done well these will now be rooted, and fit for planting out in a border of fine soil, about 3 or 4 inches asunder. By this treatment they form well-rooted sturdy plants for planting in their flowering beds about the middle of September. The same remarks as to the preparation of the soil apply to the Pink as much as to the Carnation and Picotee. Although the Pink is altogether a more hardy and easier grown plant, and will flourish in a position where the Carnation will not, they will do all the better when the soil has been previously well prepared for them; the plants are apt to be attacked by aphid when they are under glass, therefore it is a good practice to dip them in some solution that will kill the fly, before planting them out. The forcing Pinks, which were propagated in March or April, are now

of large size, and planted out in the open borders. All that they require is to have the ground hoed, and if they are planted in light open soil they will form large clumps for potting up in September.

DAHLIAS

will now require much attention. They are growing fast, the recent showers following after the long spell of dry hot weather has had a most beneficial effect upon them; and they should be kept in a growing condition. Each plant was furnished with a stout stick in the spring, and in addition to this four or five more will be required for each plant to support the side shoots. Some growers allow the plants to grow as they like until the end of the present month, and then thin out severely with a knife. Some of the best of the old growers objected to this, and never used a knife at all; the shoots being removed when of small size with the thumb and finger—that is, the small shoots which grow from each joint of the side branches. It is in accordance with the maxims of good gardening that no plant should be robbed of a large number of its leaves and branches at one time. Growers for exhibition are also careful to remove in the early stages all misshapen buds, and such as are likely to produce what the fanciers term cross-eyed flowers. Those who grow for exhibition are careful to shade the flowers as soon as they show colour, especially the light ground varieties. The dark flowers should not be so closely shaded. In such seasons as the present, when thrips are abundant everywhere, it may be necessary to tie up every flower intended for exhibition in a muslin bag, but before doing so, see that no thrips are tied up in the bag with the flowers. To make sure, one man should hold the flower in his hand, whilst another syringes it well with clean water. If dry weather should again set in, the plants should be syringed, or watered overhead every night. Mulching the ground between the plants has of course been attended to some time ago. Perhaps the best material for this is half-decayed stable manure. Moreover, manure water should be applied as soon as the buds are well formed. If a stock of any particular variety is required, now is a good time to take cuttings of the lateral growths. Of course, in that case, the thumb and finger should not be used to remove them before they are grown large enough. Put each cutting in a small pot of fine sandy soil, and they will root freely in a hotbed, if taken off at a joint; but the heat should be very gentle, and well nigh spent before the cuttings are put in the frame. *J. Douglas.*

CHRYSANTHEMUMS.

The details of summer-management are numerous, and very often rendered irksome in the carrying out by reason of the many other duties requiring attention at this season. So great a hold has Chrysanthemum culture upon some persons, that numerous details beyond affording water to the plants, are done in the evening, rather than let them suffer from neglect. I know of employers who begrudge the time spent during the day upon these plants, yet when they are in full beauty prize them highly. So much then for perseverance under difficulties of the successful cultivator. One of the greatest errors a person can be guilty of is attempting to grow too many plants, it being, as I have often said, better to grow fifty well, than spoil a hundred. No matter for what purpose the plants are cultivated, they will be by this date in their flowering pots; the only exception being the latest batch of bush-grown plants, or the Pompons. I am this year giving Porter's Invincible Wire Crocks a trial, and where a difficulty is experienced in standing the pots all the summer on a hard bottom, or on boards, tiles, or slates to keep worms out, these crocks appear to be excellent excluders. They consist of closely-woven brass wire, through which a worm cannot pass, and one is laid over the hole, and broken crocks put in in the ordinary way on the top. Pots of small diameter may be employed for Pompon and single-flowered sections. The bulk of our plants are grown in 7-inch pots, some few,

perhaps, in 8-inch. I do not care for huge plants, but rather those of upright growth, with few branches, and these carrying great lengths of flower-spikes.

A good many complaints have reached me about the unfavourable state of plants, owing, it is said, to a too free use of bones as drainage in place of crocks. Now, when bones are so used, they become putrid when wetted, and affect the roots injuriously that are in the adjacent mould. A compost of three parts loam to one of partly-decayed or even only fermented horse-droppings, a small portion of leaf-soil, not quite decayed, with sufficient sand and charcoal to keep the whole porous, forms a suitable compost, and to every bushel of compost 2 lb. of either Thomson's or Innes' Vine Manure may be incorporated. Assuming the plants intended for producing large blooms are now in their summer quarters, considerable attention will be needed in regulating the shoots, which are being made very rapidly, in contra-distinction to the stocked growth made in the hot weather. The bulk of our plants have three stems each, which means that they will give that number of blooms, one only being allowed to develop on each stem. I would advise cultivators to afford sufficient space for the plants, that the leaves of one do not overlap those of its neighbours. If all are tied to single stakes made fast to horizontal rails, abundance of air and light will reach them. Instead of placing the three stakes in the pot, to be afterwards tied to the wires, one stake only should be thrust into the pot, and this not in the centre, but near to the side. To this stake the centre shoot is made fast, and temporary small stakes are secured to the wires for the two side shoots. By allowing ample space for the leaves and shoots to develop fully, the wood becomes matured. When the plants are housed, the two side branches will be loosely tied to the middle stake. All side shoots must be promptly removed, so as to concentrate the energy of the plant in the selected growths. Incessant attention should be paid to tying the shoots to their supports, neglect in this often causing much disappointment at a later period; and the points of shoots being brittle and tender, they are liable to be broken off by the wind, rains, and other causes, and the loss of branches spoils the symmetry of the plants. Some persons I know of think the plants are safer when the shoots are allowed to remain loose at the point for the length of 1 foot or more, thinking that if they bend to the wind they are safer than though they were tied securely up to the tip, and I have known these same persons having to lament the loss of as many as fifty shoots in one day during a strong gale of wind or a heavy shower of rain. Remove early all small laterals from the stems. Because the Chrysanthemum is a moisture-loving subject, some persons suppose that it cannot have too much moisture at the roots, which is a mistake, often exhibiting its bad effects in pale-coloured leaves. If water be partially withheld from such plants for at least a fortnight a marked difference will be discernible. I do not mean to advise water being quite withheld from them, but a lessened supply, and only when it is absolutely necessary to prevent flagging. No better method that I know of exists for ascertaining the condition of the soil than rapping the pots with the knuckles. Use soft water if it be available, the plants thriving so much better with it than when well-water is used. If rain-water cannot always be secured, a very good substitute can be made by dissolving common washing soda in hot water, adding a quarter of a pound to every 40 gallons of clear water. If allowed to stand twenty-four hours it is ready for use, the sediment not being used, impregnated so thickly as it is with lime and other substances.

In hot and dry weather the plants will be the better if the foliage be vigorously syringed morning and evening with clear water generally; but if there be any signs of mildew, red-spider, or a slight paleness in the foliage, a handful of soot or sulphur thrown into the water at syringing time will add to the "tone" of the leaves very considerably, as well

as check insect pests. Some varieties throw up many root-suckers, but these should be promptly removed and utilised as cuttings, which will strike in a cold frame, and grow into stocky plants very useful for decoration, as one decent-sized bloom will be produced on the point of each.

One object in growing these small plants is the securing of stout suckers suitable for cuttings of new or rare varieties, which may be difficult to obtain in the usual way from the plants that are grown to give large blooms, and which, mainly owing to being highly fed, do not throw up so many cuttings as are sometimes required.

Very soon the plants will require a course of stimulating food given to them. There is such a difference of opinion as to the time when this should commence; some cultivators say not until after the bloom-buds are formed, others much earlier; my advice is to commence gently with weak doses directly the pots are full of healthy roots, when the roots need more feeding. If strong stimulants are given before the roots have taken full possession of the soil, the latter is rendered sour and unwholesome. *E. Molyneux.*

APPLE CULTURE FOR FARMERS.

THROUGH the oft-repeated freaks of Nature I am not this year in a position to send you a very glowing account of the out-door fruit crop of this district. We do not lay claim to having our fruit trees in better bearing condition than those of anyone else; yet we are satisfied when the blooming period arrives to know that our blossom appears to be as good and as strong as that of our neighbours.

We seem in this country to have frosts at such measured times as to almost completely kill the bloom of every variety of fruiting tree directly it begins to open, and in many instances long before the bud has opened. To satisfy ourselves as to this, one has only with a sharp knife to split the bud in two, and then, if killed, the embryo fruit will be found black at the core. But for those almost ever recurring frosts, and the various caterpillars which commence their depredations immediately the bloom begins to fade, so that any blossom buds which escape the frost are nearly deformed by the caterpillars; but for these two potent drawbacks, we might boast of fruits equal, if not better, than those from any other known temperate climate. We are sorely handicapped by these two very grievous drawbacks. Trees on walls may be protected from frosts, and by hand picking and careful syringing they may even be kept scrupulously clean, *i.e.* where the cost of labour is no object; but to treat extensive open orchards in a similar way is a very different thing. We have a small orchard here in a very snug sheltered corner, the very place where anyone might say an orchard ought to be, yet year after year, what with the frost and the caterpillars, our little orchard is seldom or ever what we might fairly expect it to be, and I often envy those who have better success when their orchards are freely exposed to the north and east.

To our other multitudinous studies of the pests of the insect world which prey upon and often wreck the best intentions, even of the most vigilant gardener, we must now at once commence the study of the Lepidoptera family—at any rate, that branch of it to which belong the winter moth (*Chermatobia brumata*), both male and female of them, and get our bands of cart-grease ready and placed in position for their capture when the female insects are on their march up the stems of the trees. Gardeners had better see to their laurels at once in this matter, else they may find themselves far out-distanced by farmers, many of whom, through the apparent failure of their own industry, are about to throw up the agricultural sponge, and go in for Apple growing; for this there is just now ample scope, an industry which has a great future before it. For the supply of the trees which will be required, not in thousands but in millions, I would advise the Veitches,

the Bunyards, the Dicksons, the Laings, and the Lanes to be getting their stock ready.

Apples, either raw or cooked, with a little Demerara sugar and clove thrown in, form the very best food obtainable for the feeding and fattening of pigs [and men. *ED.*] Only imagine the flavour on your palate of such pork, bacon, and ham from animals fed on such ambrosial food as this! This country could supply all its own bacon, &c., so that there would be no fear of our being affected with trichinæ. So that looking ahead, and making preparation in time, farmers, now much dispirited by low prices, might raise up an enormous trade from swine fed on Apples as above described. During the season a few Acorns thrown in would make the food even more *recherché*, for the pig dearly loves to crack an Acorn. What an odd thing that some of the almost bankrupt farmers had not already solved the problem in some such way as this, by turning some of their now almost profitless land into smiling orchards of fruit trees, and in the raising up of thousands of pigs to eat the crops. Like all other new or improved industries, there will be a run upon this trade at no very distant day, and those who have the courage first to begin and be first in the market will, of course, have by far the best of the trade. Landlords who have land which they can neither let nor sell, would do well to take into serious consideration the creation of orchards, suiting the various kinds of trees to soils best adapted for them, introducing Pears, and some of the most useful and free-bearing varieties of the Plum family.

Besides the unlimited outlet for an abundant Apple crop by means of feeding pigs with the fruit, there are a number of other industries of which fruit would form the staple product, which would receive similar impetus; such, for instance, as the extension of cider and perry manufacture, further development of the manufacture of jams and jellies, &c. All these household commodities would be brought into market at prices far below those obtaining now, thus bringing out a class of buyers in great numbers who could before never enjoy these luxuries.

Apologising for the above digression, I will now give a brief account of the state of our fruit crops. Apples are satisfactory and partial, some trees heavily laden, whilst others have few or no fruits. The Pear crop is very much worse than the Apple crop, and fruit seems to be thin everywhere, although the blossom, like that of other fruits, was all that one could desire. Plums are better, but the crop is not everywhere a good one. Cherries, especially the Morello, seem to be the fruit crop of the year in this part. Peaches and Nectarines—of these we have no fruiters outdoors, but indoors they are very fine indeed. Apricots—of these there is a sprinkling. Red and black Currants, Raspberries and Gooseberries are plentiful and good. Strawberries were very good, and the crops were saved by copious waterings and a heavy mulching before the drought had time to spoil them. Hazel-nuts as well as Acorns are plentiful, and have all the appearance of being very fine. Of Walnuts I cannot speak with certainty.

No season that I can remember could excel this one in the beauty of the foliage of the trees of this specially favoured wooded county. *W. Miller, Combe Abbey.*

FIBRE PREPARATION IN ZANZIBAR.

In a report on the trade and commerce of Zanzibar for 1892, it is stated that, in view of a considerable development of the coir and fibre industry, owing to the large number of fibre-producing plants which overrun the fertile portions of the island wherever the ground is not cleared for Cloves, some attention has been given to the question of setting up fibre-extracting mills. One such mill is said to be now in full working order, its complicated machinery being run without European supervision, entirely by natives of the island, who have been trained and instructed in their work by an energetic partner in the house. Some fifty native men and women are now employed in preparing fibre, spinning

yarn, &c., and a separate branch has lately been established for the weaving of matting. At the outset, about one thousand Cocoa-nuts were worked up in the day; now the efficiency of labour has so developed that, though the number of workers has been reduced, four thousand nuts are disposed of per day. A difficulty is experienced in the supply of material, although the Cocoa-nut tree flourishes throughout the island, in consequence of the absence of any adequate means of transport: it consequently pays better to take dhow loads of fruits from the mainland than to collect them on the island itself. The same difficulty stands in the way of utilising the Agave leaf, which grows in a desultory way wherever the ground is not cleared, and which would produce a still more valuable fibre did any means exist for collecting and bringing the raw material to the mills.

FUCHSIA DUNROBIN BEDDER.

This dwarf Fuchsia is one of the best things in the Chiswick gardens. There are two beds of it, one near the Council-room, and the other by the side of the walk leading from the conservatory. This form of *F. Riccartoni* deserves to become popular. It is very dwarf, not more than a foot in height at the utmost, and the leaves, though small, are numerous, and of the deepest green colour. The flowers are crimson, produced with great freedom, each plant a mound of foliage and blossom. A single bed of it is attractive, but doubtless more use will be made of it for edging large beds, and for this purpose it is well adapted. There is another important point, and that is its hardiness. Plants at Dunrobin Castle have stood many winters. It was raised by Mr. Melville of Snowdrop fame, and is likely to get as popular in gardens as any Fuchsias. Its dwarf habit is a great commendation. *V.*

THE WEEK'S WORK.

THE KITCHEN GARDEN.

By H. C. PAINSEP, *Gardener, Buxted Park, Uckfield.*

CORN SALAD OR LAMB'S LETTUCE.—A sowing should now be made in a warm sunny spot, in drills 6 inches apart. The plants stand the winter well on rather poor, dry soil, but on that which is damp, rich, or heavy, it gets cut up in frosty weather, therefore a dry and warm place should always be found for it. When large enough to handle, thin the plants to 6 inches apart.

AMERICAN OR LAND CRESS.—This plant, being a perennial, is often left uncared for, but finer leaves are afforded by young plants, and seed should be sown annually at this time, and cultivated as recommended for the foregoing.

GLOBE ARTICHOKE.—Plants which may have finished their supply of head should have the old flower stems cut off at the ground-level, and all the outside leaves removed, for after the recent heavy showers, young growths will form very rapidly, and these will, by the latter part of September, be strong, and may be drawn together and blanched like Cardoons. The growth of the plants should be aided by liberal waterings of liquid manure. The stronger and quicker the growth, the tenderer will it be when blanched. Small suckers may be removed with a heel, and placed in 6-inch pots, plunging them into a bed of coal-ashes, watered, and shaded during bright sunshine. They will make nice plants by the arrival of winter, when they should be removed to cold-frame protection. Plants treated in this manner will produce fine, earlier heads the following season than if left to take their chance in the open ground.

LEEK.—Those intended for early exhibition purposes should now be earthed-up for blanching, which should be done when the soil is dryish, or the outside leaves will decay away. Succession plants may be encouraged to grow by affording manure-water or some artificial manure.

CELERY.—Afford the plants a dressing of soot, especially applying it on the soil alongside, to deter

snails and slugs, which eat holes in the leaf-stalks, spoiling their appearance, and setting up decay. Suckers should be removed from time to time, not allowing them first to get strong before breaking them out. Heavy watering must be afforded, and the soil not allowed to get dry, neglect of this causing toughness in the stalks, and a certain bitterness of flavour. Do not let weeds grow to any size before clearing them out of the trenches; and with the single-handed hoe keep the surface of the soil in the same slightly stirred.

POTATOS.—The haulm of most of the mid-season kinds having died down, the tubers may be lifted, and should the rind be not quite firm, allow them to remain on the ground for a few hours after digging, which will render it firm enough to handle with care, without losing any of it. The tubers must not be left on the ground for the morrow's sun to shine upon them, or discoloration of the rind will occur and the flavour will be spoiled. Potatoes put into a cool dry cellar, with light excluded, will keep in good condition longer than if covered with straw and earth, and they are better in flavour. But whether in a "bury" or in the cellar, they should be thinly placed, so that heating does not take place. Any neglect of these precautions at this season will spoil Potatoes.

COLEWORTS.—Plants will now be forward enough for planting, and should be transferred to rich ground at about 1 foot apart in the row, and $1\frac{1}{2}$ foot from row to row. Dibble them into drills drawn with the hoe about 3 inches deep, and close the drill in about six weeks, and earth them up late in October.

CARROTS.—Where the early crop is fully grown, and it is not required immediately, it will be advisable to take up the roots, and store them in a cool cellar, for if much rain were to fall, the roots would split and become comparatively useless. A sowing of an early variety may now be made on a warm border and in such a manner that the beds may be protected from frosts. This sowing will be of much service in the spring months, particularly if Carrots are not forced. Carrots do not suffer from frost in a light sandy soil, but in that which is retentive and cold there is difficulty in keeping them in good condition throughout the winter if it be a severe one.

TURNIPS.—These may still be sown in good ground, choosing the hardiest and quickest growing kinds for the purpose. If the ground be not in a very fertile condition, a dusting of guano on the surface should be made before sowing.

PLANTS UNDER GLASS.

By B. WADDS, Gardener, Birdsall Gardens, York.

CAMELIAS.—If the borders are well drained liberal supplies of water may be afforded, but the amount of water should not be so large as to induce fresh growth to be made, as the buds are now set earlier in point of time than I have observed them. Lady Home Campbell and *C. fimbriata* alba are very forward with me, and liquid manure will be afforded these varieties sometimes, and daily syringings with the garden-engine or the water hose. If scale or mealy bug are present it is a good time for thoroughly cleaning the plants.

CLIMBERS.—Continue to give climbing plants in the conservatory plenty of water, say once a fortnight if in borders. *Datura Knightii* and *Clianthus puniceus* are plants that require a good supply of water at the roots and overhead at this season, which will greatly aid in keeping red spider in check. *Bougainvillea glabra* in large or small pots, or planted out in borders, is a useful decorative plant that requires liberal treatment, and to be kept cool, its rosy bracts being of a much better colour in a cool house. *Bougainvillea speciosa* requires a stove to flower it well, and to be planted in a border of rich soil, and have abundance of space in which to grow.

SARRACENIAS.—*S. Drummondii* and *S. atrovirens* resemble in many ways their allies of the tropics with their beautiful pitcher-like leaves with their traps for the unwary flies, requiring a temperature of from 50° to 60° in the summer, and one of 40° to 60° during the winter. They are best grown in well-drained pots filled with peat and sphagnum moss, afforded plenty of water whilst growing, and shade from bright sunshine. During the winter *Sarracenia*s should be kept slightly moist at the root.

VIOLETS.—These, if in preparation for winter flowering, must be kept clean and healthy; a slight sprinkling of nitrate of soda being afforded them before a shower of rain, which will help them con-

siderably if they are looking yellow, or have red spider on the leaves.

DAPHNE INDICA ALBA, AND D. I. RUBRA, whether planted in borders or in pots, should have abundance of air and light, and not too much water at the roots, or the leaves will turn of a yellow tinge, and the flower buds fall off. A top dressing of rich manure is beneficial to pot-bound plants.

THE HARDY FRUIT GARDEN.

By T. TUNTON, Gardener, Maiden Erlegh, Reading.

THE STRAWBERRY.—Those runners which were layered early will have made sufficient roots to fit them for planting out; and the earlier that this is done the stronger will the plants be when growth ceases for this season, with the result that the crop next season will be a good one. It is a mistake to leave runners which have been layered in small pots to be root-bound, as they then grow at the first less kindly when planted. Moreover, it is necessary to water root-bound plants in dry weather until rooting has become general; whereas, runners possessing just as many roots as will keep the ball intact go away at once if watered a short time before planting out, and once afterwards. Provided the ground to be planted was prepared and cropped as I recommended early in the spring, viz., by trenching, well manuring, and cropping it with early varieties of Potatoes, this should now be made as level as possible, which will be best done by digging it over quite shallow with flat-tined forks. It must then be trodden firmly and evenly, and the foot-prints obliterated with the fork or a rake. If space is of no moment, the distance apart to plant free-growing Strawberries like *President*, *Sir Joseph Paxton*, *Vicomtesse H. de Thury*, &c., is 3 feet from row to row, and 2 feet in the row, whilst those which are smaller growers, as *Keen's Seedling*, *Oxonian*, *British Queen*, *Jas. Veitch*, *Dr. Hogg*, *Elton Pine*, &c., may be set out at 30 inches from row to row, and 21 inches in the row.

THE MORELLO CHERRY.—As trees are cleared of their fruits, as is the case in this garden, it is at this season more convenient to pay attention to the trees on walls than in the spring, and there can really be no question as to the advisability of cutting out all the superfluous shoots, and those which have fruited this year, tying in as many young shoots as may be necessary for securing a crop next season. The trees should then be syringed several times, and if the land be dry, as it mostly is near walls, a heavy watering should be afforded. Standard Morellos will scarcely be so forward as wall-trained trees, but when the fruit is gathered it will be necessary to carry out a similar thinning of weak shoots and those which have fruited, but this operation need not be so severely carried out as is absolutely necessary with wall Cherries.

EARLY PEARS.—The earliest and the finest fruits of *Williams' Bon Chrétien* on trees trained to walls having a warm aspect, should be gathered at short intervals of time, and placed in boxes, darkened by having the lids partly closed. These may be put in a warm room or ainery, and some should go into the fruit-room so as to afford a succession of fruits for dessert. Treated in this manner the fruits will be superior in flavour to those left to ripen fully on the trees. On pyramid or standard trees such is not the case. *Clapp's Favourite* and *Beurré d'Amanlis* Pears may also be gathered in small numbers and placed in warmth.

THE ORCHID HOUSES.

By W. HOLMES, Gardener, Pickering Lodge, Timperley.

PHALÆNOPSIS.—These plants should be making free growth at this season, and most of them a second leaf. On warm days I have the bottom and top ventilators of the house in which they are grown opened on the south side, closing the latter early in the afternoon, when damping down—that is, about 3 o'clock, later or earlier, according to the warmth outside. The bottom ventilators remain open day and night for the present, but the width of the openings is varied, according to the state of the weather; in the evening the house is damped once more, and at this time cow-shed drainings are thrown beneath the stages on which the plants stand. In the morning clean water is syringed amongst the plants, and a moist atmosphere maintained generally. The black thrips which attach themselves to the undersides of the young leaves must be closely sought for, as these insects increase fast, doing much damage. A sprinkling of soot in the evaporating troughs once a fortnight will be found of benefit.

THUNIA MARSHALLIANA AND T. BENSONIÆ.—These species, having finished flowering and growth, may be removed to a lighter and airier house than their growing quarters, and less water should be afforded, but on no account must the plants be dried off for the present. Our plants are removed to the end of the Mexican House, and nearly full sunlight allowed to fall on them, this house being shaded no more than is really needed, i.e. for a few hours only during the brightest part of the day. The gradually withholding of water will take quite another month to turn the leaves of a yellow colour and cause them to fall off. This done, the plants should be removed to a much cooler and more airy house, such as an early Peach-house orinery, from which the fruit is cut, to mature the growth before resting. In this stage they will need very little water.

FRUITS UNDER GLASS.

By M. TEMPLE, Gardener, Carron House, Falkirk, N.B.

VINERIES.—Vines recently planted should be encouraged to grow freely in order to complete their growth while there is sun heat and light to mature it. Care must be exercised to prevent the overcrowding of laterals. The syringe should be used freely in the afternoon, shutting up with sun heat at 85° or higher. When the trellis space is fully occupied with canes, a general course of stopping and thinning must be closely followed, and where growth is completed, let the warmth, accompanied with a free circulation of air, be maintained night and day. Water at the roots in sufficient quantity should be afforded to moisten the whole of the soil; merely moistening the surface of Vine borders will act most unfavourably even on young Vines. When grafting or ioarching has been practised, an examination of the ties should be made, these being cut or loosened if a union has taken place, and the wood is swelling fast, otherwise maintain them intact. Follow former advice regarding the removal of small seedless and shanked berries from ripe and ripening grapes. Those to afford fruit for table for some time to come should be kept cool, and have the bunches shaded by some dark sort of tissue paper for black varieties, while white paper is more suitable for light or golden-coloured Grapes.

SOILS.—It is an important matter to the grower of fruit to have plenty of good soil, dug and stacked, at the present season. When digging, the right depth of the richer portion of the loam should be ascertained, which is seldom more than 2 or 3 inches, although in some old pastures 8 inches may be taken with advantage. The rough grass should first be removed from the turf, as it is sometimes productive of fungus on decomposition, and the soil, when carted in, should be stacked in long sharp-pitched ridges from 6 to 12 feet wide at the base, and the site for the stacking should not be a wet one. Where turf or other misden soil cannot be had, it is a good practice to collect the surface-soil from vegetable ground, and mix rotted stable-dung with it (plenty of old straw in the soil is advantageous); and when this has been in a ridge for a year, and having been carefully turned during the time, it is in good order for use. This is an old practice, which we have often witnessed in London market gardens, where there is no old pasture to go to.

TOMATOS.—Those plants lately placed in their fruiting quarters should not be coddled, but have plenty of air and light, and the laterals removed, or stopped at one leaf from the stem, and as these plants are to furnish fruit in early winter, they should have free drainage, and the soil should contain no fat-manure, as assistance can be afforded to better advantage when the fruits are developing. Cuttings may now be taken off, and rooted in bottom-heat. Tomato-plants are sometimes cropped too heavily at this season, shortening the period during which they bear fruits, and although such plants may be restored to vigour by allowing young growth to take the place of the old, such plants cannot produce such fine fruit as young plants.

CUCUMBERS.—Those which have been grown from cuttings are inclined to bear fruits too freely, to the shortening of their existence, therefore thinning of the fruits should have regular attention. Winter fruiters should be encouraged to make short-jointed strong bines, by a free admission of air and light. Cucumber plants grown in high temperatures on the non-airing method, fall in the hands of some growers, owing to the neglect of thinning of fruits and shoots. Frequent surfacing with bone manure and soil mixed together, when the roots appear at the surface of the soil, is of great use in maintaining activity of growth.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETING.

TUESDAY, AUG. 8 { Royal Horticultural Society, all committees meet, and lecture by Mr. J. G. Baker, F.R.S., on Cannas, at the Drill Hall, James Street, Westminster.

SHOWS.

SATURDAY, AUG. 5 { Royal Horticultural of Southampton, and Monday.
 MONDAY, AUG. 7 { Beddington, Carshalton and Wallington Horticultural.
 TUESDAY, AUG. 8 { Leicester Horticultural in the Abbey Park.
 Royal Horticultural at the Drill Hall, James Street, Westminster. Exhibition of Cannas.
 WEDNESDAY, AUG. 9 { Gardening and Forestry Exhibition. Earl's Court. Flowering and Foliage Plants (two days).
 THURSDAY, AUG. 10—Taunton Dean Horticultural.

SALES.

WEDNESDAY, AUG. 9 { Sale of Stove and Greenhouse Plants at Langley Broom, Langley, near Slough, by Protheroe & Morris.
 FRIDAY, AUG. 11 { Sale of Orchids, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—62°·9.

As a nation, we are rather apt to disparage ourselves and our institutions, and, as regards educational matters, not without reason. The fifty years of continuous experiment on a settled plan at Rothamsted form, however, a glorious exception, and one which no nation has attempted to rival. The several crops in the experimental fields are made to tell their own tale every year, and every condition of cropping and manuring is carefully noted and compared. Every fluctuation of temperature or rainfall is registered with special reference to the crop. Careful analysis of every crop and of the drainage water, at different levels, is made, and samples are preserved for future investigation if necessary. The records of all this work, which comprises researches into animal as well as vegetable growth, are necessarily extremely voluminous, but means have been taken by lectures and otherwise to render the experience gained available alike to the man of science and to the practical farmer; and Dr. GILBERT, who might fairly consider that he had earned his rest, is once more to cross the Atlantic this autumn, and carry on the propaganda in the States.

This work at Rothamsted, as important as it is colossal, has been achieved by the keen insight, the grasp and perseverance of Sir JOHN LAWES, and by the untiring energy of his coadjutor, Dr. GILBERT. Their joint work began fifty years ago, on a relatively small scale, in the farm attached to the park at Rothamsted, when a barn served as a laboratory. It has grown and developed to a degree that may fitly be called colossal. Of course, some of our Continental friends, not conversant with our way of doing things, may think the Government gives a large subsidy. Here, we know it does nothing of the sort. The whole scheme is, and has been, worked at the expense of Sir JOHN LAWES, who, moreover, has set aside a munificent fund in trust, as well as land and buildings, in order that the work may be efficiently carried on in the future.

On Saturday last a distinguished and representative gathering met at Harpenden to celebrate the jubilee of the co-partnership in work of Sir JOHN LAWES and Dr. GILBERT. A massive granite boulder is erected to commemo-

rate the event; a portrait of Sir JOHN LAWES and a handsome gift to Dr. GILBERT were also presented as evidences of the appreciation in which half a century of work—and such work—is held by those capable of forming an opinion. France and the United States were, as is meet, duly represented on this occasion as well as our leading Societies, scientific and practical.

"Dr. GILBERT and himself were," said Sir JOHN LAWES in replying to the addresses, "bound by no ties; but this connection, as he had said, had continued fifty years. What was the cause of that? It was nothing less than that he had an immense love of the work they were engaged in. He had delighted in the work from the very beginning, and had given as much time to it as he could consistent with other duties; but Dr. GILBERT had made it the work of his life. Had it not been for the labours of Dr. GILBERT the affairs at Rothamsted would have been in a different state to that in which they now were. Dr. GILBERT was not only at work when he was at home, but what were called holidays were spent by him in visiting other countries and places, by putting himself in communication with other bodies, so that he might make his own work more valuable to those at home. This year he was going to Chicago to deliver a course of lectures on the work at Rothamsted."

POLYGONUM SACHALINENSE.—So much interest has been excited by our notice of this plant as a forage-plant in a recent Number, that we are induced to revert to the subject, and give an illustration of the plant producing its seed-vessels. The plant was first described by F. SCHMIDT in 1853, and on its introduction to our gardens in 1869 or 1870, by Mr. WILLIAM BULL, it was made the subject of a descriptive notice by ourselves in our volume for 1870, December 3, p. 1599; and again in 1886, December 25, fig. 158 (here reproduced). It was figured also in the *Botanical Magazine*, t. 6540, and its great merits as a decorative plant have since been generally recognised. Our distinguished colleague, M. ED. ANDRÉ, introduced it into France from Moscow in 1869, but it was not till quite recently that M. DOUMET ADANSON called attention to its value as a forage-plant. As some confusion has arisen in the conversion from the simple metric system of weights and measures to our preposterously absurd muddle, we repeat the figures as given by Messrs. DOUMET ADANSON and BALLET. The total weight of produce in the green state varies from 20 to 40 kilogrammes the square metre, or 200,000 to 400,000 kilos. the hectare, equalling 200,000 lb., or 89 tons, 6 cwt. 16 lb., to 178 tons, 12 cwt. per English acre, or nearly double the weight of a crop of Cabbage planted at 2 feet apart, and each plant weighing, when fall grown, 10 lb.

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the Royal Horticultural Society will be held on Tuesday, August 8, at the Drill Hall, James Street, Victoria Street, Westminster. On this occasion Mr. J. G. BAKER, F.R.S., of the Royal Herbarium, Kew, has promised to deliver a lecture on Cannas, which will commence at 3 o'clock. The Council of the Society will feel obliged by those exhibitors who will make special exhibits of these plants on that day. The Society will not hold another meeting in the Drill Hall until September 12, owing to the circumstance that it will hold a show at the Agricultural Hall, Islington, from August 29 to September 1 inclusive.

GARDENERS' ORPHAN FUND.—The monthly meeting of the Committee took place on the 28th ult., at the Horticultural Club, Hotel Windsor, WILLIAM MARSHALL, Esq., in the chair. In the course of the meeting some matters of interest connected with the administration of the Fund were discussed, and reserved for further consideration.

The Hon. Secretary announced the following receipts:—From Mr. J. LYNE, Local Secretary, The Gardens, Foxbury, Chiselhurst, £16 1s.; Mr. G. W. CUMMINS, Local Secretary, The Gardens, The Grange, Wallington, sale of flowers at Croydon Horticultural Show, £8; collected at the Wimbledon Flower Show, £4 2s. 6d.; and box per Mr. J. Kneller, The Gardens, Sudley Royal, Ripon, 9s. After the transaction of some routine business the Committee adjourned until the last Friday in October.

THE CHRYSANTHEMUM SEASON.—The opinion expressed by some that the season of bloom of the Chrysanthemum will be unusually early this year, is not shared by all the leading growers. At the recent meeting of the Committee of the National Chrysanthemum Society, it was reported that some of the affiliated Societies were arranging to hold their shows on an earlier date than usual. Mr. NORMAN DAVIS and other growers of repute were of opinion the height of the blooming season will be but little earlier than usual. It was held that, owing to the drought, bud formation in the Chrysanthemum had set in earlier than usual, but as many took their last buds three weeks or a month ago, the plants, owing to the rainy weather, had commenced to make growth, and that might go on for six weeks; then the crown bud would be made, and so he thought the flowers would be at their best at the usual time. Mr. H. J. JONES and Mr. C. GIBSON were of the same opinion. It may therefore be well that undue haste in putting forward the dates of Chrysanthemum shows be not shown at present.

WASPS.—These troublesome insects are very numerous this summer, the effect doubtless, in part of the general neglect in catching the queens in the early spring. It is not true economy to offer no rewards to the boys for catching them, as much fruit—in value greatly exceeding the rewards given for catching them—is spoilt. It is always advisable to burn the queens that are brought, the enterprise of some boys leading them to offer the insects over and over again as fresh catches, indeed until they are very far from being "fresh." A squib made of stiff paper and filled with two-thirds flowers of sulphur and one-third gunpowder, rammed in tightly, is a very good exterminator if set alight, and thrust into the entrance—this, or any other entrances to the nest being closed securely with soda. Gas tar, petroleum, carbolic acid, are all of use in destroying wasps' nests. Haaging nests can be brought down in the evening, with a gun loaded with number six shot, and half an ordinary charge of powder. When it has fallen cover at once with a large piece of stout canvas and trample the wasps to death; or syringe it with petroleum and set it alight. It is always best when wasping to wear a muslin net secured over a wide brimmed felt or straw hat, and thick gloves and gaiters. Enormous numbers may be trapped in various ways, but the destruction of the nest is the most effectual cure for the present plague. Speaking of wasps, we may mention that a correspondent has sent us blooms of Marie Van Iloutte Rose eaten by wasps in a way we never noticed before.

NATIONAL ROSE SOCIETY.—"As enquiries have reached us as to the character of a circular recently issued by Mr. C. J. GRAHAME, owing to the circular and envelope being headed "National Rose Society," we think it should be clearly understood by the members—1. That Mr. GRAHAME has resigned his position as a member of the committee. 2. That the document in question has no official sanction whatever. H. HONYWOOD D'OMBRAIN, EDWARD MAWLEY, Hon. Secretaries."

EXPERIMENTS COMMITTEE OF THE KENT COUNTY COUNCIL.—A meeting of the above Committee was held at the Horticultural College, Swanley, on Thursday, July 27, and Mr. P. SMITH, M.A., B.Sc., gave an account of "Canker in Apple Trees," illustrated by diagrams. He said that this disease was usually caused by a fungus, *Nectria ditissima*,

FIG. 32.—POLYGONUM SACHALINENSE: RECOMMENDED AS A FORAGE PLANT. (SEE P. 158.)

which gained entrance to the wood through wounds in the bark, caused either by branches being broken or rubbed, and also by injury from frost. This disease once being established in a tree, usually spreads over it. He went on to say there was probably no absolute remedy, but injury to the bark should as much as possible be avoided, and in pruning the branches should be so cut off as to expose the wound as little as possible to rain. He recommended painting over the wound with gaster. Good treatment and cultivation of the soil aided the trees to resist the disease by keeping them in a healthy growing condition. The fact that certain varieties are much more subject to the disease than others was discussed, and it was thought that this was to some extent governed by the hardness of the wood, the more sappy-wooded trees being most liable to be attacked. A vote of thanks to Mr. P. SMITH was proposed and seconded. At the next meeting, August 10, Mr. J. V. WING has offered to give an account of his trials of manures on Potatoes this year, and Professor CHESHIRE an account of cultural methods observed in France, from which he has just returned.

"RED SPIDER."—A correspondent sends us a printed copy of Miss ORMEROD's favourable remarks on some Hop leaves which had been very effectively treated with a wash of his invention for the eradication of "red-spider." Any really efficient and to plants non-injurious means of lessening the numbers of these troublesome acari or mites—total eradication is out of the question—would prove a great boon to gardeners, if it should be found as cheap and as easily applied as flowers-of-sulphur. Perhaps the inventor of the remedy will kindly furnish us with a small quantity for the independent testing of its alleged powers.

GERMAN DENDROLOGICAL SOCIETY.—The Deutsche Dendrologische Gesellschaft will hold a special meeting for the confirmation of statutes and other purposes at Leipzig, on August 27, at 9 A.M.

THE JARDIN DES PLANTES.—A list has been published of the living plants offered by the Museum of Natural History, Paris, to other establishments in exchange.

BRITISH FLIES.—Mr. F. V. THEOBALD's account of British flies (ELLIOT STOCK), vol. i., should have received notice before. It is a systematic account of Dipterous insects illustrated with numerous figures. That these insects possess more than a pure scientific interest may be estimated when it is mentioned that fleas, gall flies, gnats, midges, of which no fewer than 268 species have been enumerated! and others are comprised in the group. References to the literature of each family are cited. Although many of the Cecidomyiidae are injurious to plants, such for instance as the Hessian fly, yet others render service by effecting the fertilisation of flowers. We do not know of any list of these gall-flies so complete as that given by Mr. THEOBALD, but in the account of the literature the publications of Professor TRAILL and of Mr. FITCH should have been mentioned. On the other hand we are glad to find a summary of the geological history of the group, including the notorious flies in amber, whilst the chapter summarising the ancient and modern systems of classification will be read with interest by entomologists who have not the means nor the time to study longer treatises.

FLORA AUSTRALIENSIS.—We are gratified to be able to announce the forthcoming publication of an eighth volume of this work, which will comprise the numerous additions made by Baron Sir FERDINAND V. MUELLER and others to the Flora of Australia, since the publication of the seventh volume by the late Mr. BENTHAM. The very numerous more or less fugitive reprints from various Australian publications will now be gathered together into one volume by their author, whose zeal and energy will, we trust, long remain unquenched.

DUTCH HORTICULTURAL SOCIETY.—We are informed that the "Dutch Horticultural Travelling

Society" proposes to visit London shortly, to see some of the places of interest and nurseries in the vicinity of London. They will probably be present at the next meeting of the Royal Horticultural Society at the Drill Hall on the 18th inst. The conductor of the party is Mr. J. K. BUDGE, the Curator of the Botanic Garden, Utrecht, and the head-quarters in London will be WEDDE'S Hotel, 12, Greek Street, Soho.

BULBS FROM ASIA MINOR.—Mr. E. WHITTALL, a merchant of Smyrna and an ardent lover of plants, has, says the *Kew Bulletin*, considerably enriched the Kew collection of bulbous plants. He is collecting systematically, and the results promise to be very successful.

BEDDINGTON, CARSHALTON AND WALLINGTON HORTICULTURAL SOCIETY.—A DINNER COMPETITION.—In connection with the annual show of the above Society in Carshalton Park, on the August Bank Holiday, a Conference on Gardening will be held at five o'clock in the afternoon. Superior and inferior garden produce will be exhibited, and a short address thereon delivered by Mr. J. WRIGHT, F.R.H.S. Questions on any points in connection with gardening may be asked by any persons at the meeting, or may be previously submitted to the Secretary, in writing, with or without the names of the querists. Among the competitions is the following, open to wives and daughters of all subscribers and members, for the best dinner to be produced at a cost not exceeding two shillings. The dinner must consist of meat, and at least two distinct kinds of vegetables, and be sufficient for a man, his wife, and three children. The value of each article must be clearly stated. 1st Prize, £2; 2nd do., £1 10s.; 3rd do., £1; 4th do., 10s.

BULBS FOR THE LONDON PARKS.—We understand that Messrs. W. CUTTASH & SON, nurserymen, Highgate, N., have received the order for the supply of bulbs to the amount of £500 for the planting of the parks and open spaces under the control of the London County Council in the season 1893-4. The same firm will also furnish the supply of bulbs required in the Royal parks, viz., St. James', Regent's Park, Hampton Court Gardens, &c.

FLOWERS IN SEASON.—We have to acknowledge the arrival from Messrs. DOBBIE & Co., Rothesay, N.B., of a boxful of very fresh-looking blooms of the following varieties of border Carnations, than which nothing could be more pleasing. Among whites were White Dame, a continental variety of great merit; Florence Emily Phoday, also exceptionally good; Empress, Mrs. Frank Watts, and Mrs. Muir. Rose Celestial and Mary Morris represented the pink-coloured varieties, while Mrs. R. Hole and Terra Cotta did duty for the buffs. The scarlets were Huntsman, said to be very free; Queen of Bedders, Dundas Scarlet, and Guiding Star, the best of the lot.

ROMNEYA COULTERI.—Messrs. VERTEGANS send us flowers of this very lovely Papaverad, with its glaucous, deeply-cut foliage, and large white flowers, like those of a single Pæony, but with the crumpled petals indicating its relationship to the Poppies. It is hardy in the Midlands, but Messrs. VERTEGANS recommend that when the plants die down in autumn they should be covered with some light mulching.

VALLOTA PURPUREA.—Messrs. VERTEGANS send us flowers from a bulb received from the Cape as a white variety. The colour, however, is a delicate warm pink, and very beautiful.

"KEW BULLETIN."—Three numbers are before us—those for April, May, June and July. The articles on Economic Botany and Tropical Horticulture are very serviceable to experts, but the general reader will feel greater interest in the miscellaneous notes which give an idea of the current work at Kew. The descriptions of new plants, Orchids, &c., render the *Bulletin* indispensable to the systematic botanist. It is interesting to learn that the first head gardener at the famous garden of Buitenzorg was trained at Kew. His name was JAMES HOOPER, who on the recommendation of Sir JOSEPH BANKS joined the Embassy to China under Lord AMPHERST, and was ap-

pointed to Buitenzorg in 1817, and remained there as head gardener till 1830, when he left Java for his health, but died before reaching Europe.

ROSES.—We learn that Messrs. Alexander, Dickson & Co., Newtownards, Ireland, are acknowledged to have had the best show of Roses at the Rose garden of the Exhibition at Chicago. Among the varieties that have done well are Mrs. John Laing, Marquis Dufferin, Marchioness Dufferin, Jeannie Dickson, and others. According to *Garden and Forest* sundry German exhibitors combined to exhibit the largest numbers of varieties. Boskoop sent a good collection, but we do not read of our great English firms having taken part in the display, which seems too strange to be correct. Standard Roses have excited the surprise of the Americans, who, it appears, are not familiar with such monstrosities.

THE HANBURY INSTITUTE.—The *Atti del Congresso Botanico Internazionale*, 1892, contain an account of the opening of the Botanical Institute, which the University of Genoa owes to the munificence of Commendatore THOMAS HANBURY. A detailed description with plans of the building is given. Mr. HANBURY has also presented to the Institute the rich herbarium of Professor WILKOMM of Prague. Dr. TREUB of Buitenzorg, Baron Sir FERDINAND VON MUELLER, Professor CARL HANSEN of Copenhagen and others have contributed to the new Institute, where also may be found collections from Dr. HANS SCHINZ, Nilsson of Götteborg, Professor CARUEL, and many others.

DORYANTHES GUILFOYLEI.—An addition to this magnificent genus has been made by Mr. F. M. BAILEY, the Government botanist of Queensland. A specimen has flowered for the first time in the Botanic Garden, Melbourne, under the care of Mr. GUILFOYLE, to whom it is dedicated. According to a communication in the *Garden* the leaves are 8 feet long, the extreme height of the inflorescence 16 feet; the actual flower-spike occupying about half of this length, with rich crimson Amaryllis-like flowers. An engraving is given in the *Garden* of July 22, from a photograph sent by Mr. GUILFOYLE, which shows the general habit of the plant, and no doubt the botanical details will be given subsequently.

A NEW ALPINE GARDEN.—According to the *Illustration Horticole*, the Horticultural Society of Dauphiny and the Tourist Society of the same district have combined to form an alpine garden at Champrousse at an elevation of 1800 metres. Five to six hundred plants are already planted. The garden is intended as a refuge for rare or interesting species whose existence in a wild state is threatened, and as an establishment wherein such species may be propagated for distribution.

PLANTS OF NORTH ABYSSINIA.—Professor PENZIO, of Genoa, contributed to the International Congress held in that city in 1892 a list of the plants met with by him in a journey from Bogos to Mensa, in Northern Abyssinia. A reprint of that paper is now before us, in which we find several new species described, such as *Cleome Hanburyana*, *Crotalaria macrocarpa*, *Kalanchoe Schweinfurthii*, *Pimpinella camptotricha*, &c.

STAPELIAS.—The collection of Stapelias formed by the late Mr. THOMAS WESTCOMBE of Worcester, has, says the *Kew Bulletin*, been presented to Kew by his sister, together with numerous notes and drawings. Mr. WESTCOMBE'S collection was the richest in the country in private hands, but there was at one time a fine series in the Botanic Garden, Oxford, and which are probably now at Kew.

HIPPEASTRUM PROCERUM (the blue Amaryllis), which is, or lately has been, in flower at Kew, was figured by M. DUCHARTE in the *Journal de la Société Impériale et Centrale d'Horticulture*, 1863, ix., p. 425, with a description and an account of the anatomical conformation of the leaf, which is very curious. The plant was introduced into France from Brazil by M. BINOT.

GODETIA LADY ALBEMARLE.—We have received several heads of plants of a selected strain of Godetia Lady Albemarle from Messrs. R. VERTCH & SONS, Exeter, loaded with blossoms, proving the excellence of the variety for summer blooming, and its admirable qualities as a subject for massing. There are several garden varieties of annual Godetias, as Duchess of Albany, with blooms of satiny white, with a pyramidal habit, and very proliferous; Satin Rose, similar to the subject of our note; The Bride, white and carmine flowers, and very free; and G. Whitney and some of its varieties, all very nice decorative subjects for the summer flower garden or the greenhouse. To obtain strong plants for early blooming, seeds may be sown in the late autumn, and afforded treatment similar to that found suitable for Mignonette intended for early spring flowering. Seeds may also be sown in March, thinly in pots, and thinned out to three or four in a pot, which may be grown in pots, or planted cut after due hardening in late April. Godetia is now included under *Cnothera*.

STEM TUBERS OF POTATO.—The production of tubers on the haulm is not an uncommon event, especially when the original tubers have been injured by wireworm or a thrust from a spade. Dr. PATERSON sends examples where the tubers formed on the stem are deeply and irregularly lobulated, as in what doctors call Cauliflower excrescence. We have not seen a similar case, but cannot, on superficial examination, ascertain the cause.

BEDDING PANSY.—Mr. J. FORBES, of Hawick, sends sample blooms of a new Pansy called Border Maid, which is stated to be a compact grower and a free-flowering variety. The flowers are of a medium size, good substance, lemon-yellow, deeply edged with violet; eye spots, rich purple, and with radiating purple lines on the lower petal. It is a distinct and bright-looking variety.

THE SCOTTISH ARBORICULTURAL SOCIETY.—The annual excursion of the Society will take place from August 7 to August 12. Visits will be made to Windsor Forest, Cliveden, Dropmore, Barnham Beeches, and the New Forest, on the return from which Kew Gardens and the Earl's Court Forestry Exhibition will be visited. A special correspondent will favour us with some details of the excursion.

STARCH FORMATION.—When a leaf is exposed to sunlight, it is well known that among the earliest changes noticeable is the formation of starch; and, further, that this starch-production is stopped by placing the leaf in the dark, so that if half of the surface of the leaf be exposed to the sun, and the other half be covered with opaque paper, the uncovered half will contain starch, while none will be formed in the covered portion, and that which it had previously will disappear. It had come almost to be an article of faith that this starch formation was the primary and universal result in the process of "assimilation," which is consequent upon the exposure of the green material (chlorophyll) to light, and the elimination of oxygen. Working physiologists, indeed, were more cautious in their utterances than text-book writers and teachers. It now appears from the recent researches of Messrs. H. T. BROWN and G. H. MORRIS, as presented to the Chemical Society in April last, that cane-sugar is the first product (and not glucose, as had been by many supposed), and as this sugar is formed faster than it can be utilised, the excess is deposited in the form of starch. This reserve of starch is drawn upon when the light fails, the starch being then dissolved by a ferment, or "enzyme," known as diastase, which is secreted by the protoplasm of the cell in amount proportionate to the needs of the case, so that the formation of diastase is looked on as an effort to remedy the consequences of defective nutrition. The course of events in the process of assimilation appears to be, first, formation of soluble cane-sugar, then deposition of insoluble starch, followed by formation of diastase-ferment, which dissolves the starch, and allows of its transmission in a fluid state, or as sugar,

from the place at which it is stored to the place where it is used up in the processes of growth and activity, which demand supplies of nourishment for their fulfilment.

HOW TO PREVENT LOSS IN STABLE MANURE.—The use of straw litter in stables has been suspected of being by no means desirable, since it facilitates loss of nitrogen—that valuable plant food. A. MUNTZ and A. CH. GIRARD have recently found (vide *Comptes Rendus*, cxvii., p. 108), that when straw is used in the stable 63.6 per cent. of the nitrogen in the manure is lost, whereas when peat-litter is employed 48.3 per cent. is lost. The best medium for preventing this loss appears to be light soil, which only permits 25.7 per cent. of the nitrogen to escape. For the retention of the ammonia in stable-droppings the use of copperas, gypsum, superphosphates, &c., have been recommended, but MUNTZ and GIRARD find that gypsum is of no advantage, whilst the addition of copperas to the stable-litter actually increases the loss of this substance, and they explain the inefficiency of the added chemicals by the alkalinity of the animal excreta which have to be saturated before any ammonia can be retained. In practice, the use of straw-litter mixed with peat or a soil rich in humic substances appears to be on the whole the cheapest and most convenient method of checking the enormous losses of ammonia which occur in stables; if peat is not readily accessible, dry light soil rich in humus should be sprinkled on the usual straw-litter.

HOFGARTENDIREKTOR JÜLKE.—This accomplished gardener, better known in Germany than here, died at Sans Souci on June 14, at the age of seventy-eight years. He was made Königlichen Gartenbaudirektor on the advice and recommendation of the landscape gardener LENNE, whose successor he became at Sans Souci in 1866. In consequence of failing health, JÜLKE was pensioned some years ago. Besides occupying the post of Chief Garden Director he was President of (and tutor in) the School of Horticulture. Dr. JÜLKE, a colonial pioneer who was murdered at Witia in East Africa, was a son of the deceased.

EARLY HOPS.—As showing the earliness of the season, Messrs. EDWARD WEBB & SONS, Seed Merchants, of Wordsley, Stourbridge, state that they received their first pocket of Worcester Hops on Saturday last. It passed the public scales on Friday, which is the earliest date on record. The grower is Mr. H. T. TAYLOR, Snowle Court. The quality of this year's crop is likely to be good, but a light yield is expected.

PUBLICATIONS RECEIVED.—*The Big Apple of the World*. By R. SMITH, F.R.H.S., Bradwell Villas, Bishop Street, Shrewsbury.

HOME CORRESPONDENCE.

RICHARDIA LUTWICHEI.—Will Mr. Brown kindly answer the inquiry concerning *Richardia Lutwychei* which was asked in the *Gardeners' Chronicle* for June 17 last? The point at issue is whether the *Richardia* described by Mr. Brown, p. 568 of the last volume, under the above name, is not really the old *R. hastata*. Those persons who consider that this is so, would have their opinion considerably strengthened by the fact that growing plants of *R. hastata* at Kew have in a marked manner the setose petioles, concerning which Mr. Brown says, "it (*R. Lutwychei*) is abundantly and easily distinguished from every other known species, except *R. melanoleuca*, by its setose petioles." Another point is that the *R. melanoleuca* at Kew is quite distinct from the *R. melanoleuca* of the *Botanical Magazine*. An Inquirer.

PRUNUS PISSARDI.—The present season appears from the reports of your many correspondents in all parts of the kingdom to be a fruitful one. I am able to speak well of fruit in this part of Southern Norfolk. Apples, Pears, and Plums are heavily cropped. The Strawberry crop was good, though small, and soon over, owing to the great drought. May I ask if it is usual

for the above ornamental shrub, *Prunus Pissardi*, to fruit. I have a nice pyramidal tree of it at the back of my cottage in a very cold and exposed situation. [Hitherto *Prunus Pissardi* has not fruited freely in this country, it being a recent introduction; but now that the trees have arrived at fruiting age, it will do so generally. Ed.] J. Batters, Gillingham, Norfolk.

CUCUMBER TENDRILS.—Will some reader of the *Gardeners' Chronicle* give his opinion as to whether the tendrils on a Cucumber plant should be removed or not? It is the opinion of many that, as they are produced in Nature, they should certainly remain on the plant, and that they strengthen it by the absorption of nitrogenous food from the atmosphere (!) But they overlook the fact that in Nature they are not provided with the ordinary means at our disposal when under cultivation, viz., training on wires. In my opinion, the tendril is an appendage produced at a great expense to the plant for a mechanical purpose, and which contains very little chlorophyll, and is therefore incapable of assimilating food from the atmosphere in sufficient quantity to repay what it costs the plant in producing it. I should be very pleased to hear the opinion of some experienced reader, as this is a matter of considerable importance considering the number of tendrils an average plant is capable of producing; and where Cucumbers are grown for seed, and not for fruit, all the more energy is required to meet the demands of the maturing seed. Haslehurst Greaves, Langport.

MURRAY'S ELECTRIC MILDEW AND INSECT DESTROYER.—The present season has been remarkable for the prevalence of blight on fruit trees, roses, and garden crops in general, alike coming in for a share of these troublesome pests; but so far mildew on outside vegetation has been entirely absent. However, we fear that with the increase of moisture, a sudden fall in temperature, and cold easterly winds prevailing, we may now have a visit of this unwelcome and unsightly visitor. I have tested various preparations all more or less accredited with exterminating qualities, but in most cases I have been anything but satisfied; but in the subject under notice I have found a real gardener's friend, which is death to all, or, I may say, all insect pests; and after repeated trials on plants infested with mildew, I am confident that it will deserve the name "electric" if the substance be applied as directed. It quickly disposes of mildew, without injuring young leaves or growth. I have also tried it against mealy bug, red spider, and American blight, and in each case I am more than satisfied with it. Another point in its favour is the fact of its having a rather agreeable odour, which is more than can be said of insecticides generally. [The composition of the substance should be made known. Ed.] J. F. McLeod, Doris House Gardens, Rochampton.

RED SPIDER (TETRANYCHUS TELARIUS) ON VINES.—How pitiable it is to see the foliage of the Vine infested with red-spider (which, by the way, is no spider, but a spinning mite), and no means taken to check its increase. Grape growers of any experience know well that, if the foliage is attacked before the berries commence to colour, and inadequate means are taken to combat the attack, it is impossible for the Vines to finish the crop of fruit satisfactorily. There are several remedies known to gardeners, but the one that is commonly used, and that with the least effect, is smearing sulphur on the hot-water pipes, making these as hot as possible afterwards. Some sprinkle the flowers-of-sulphur on to the pipes in a powdery state, first wetting the pipes, to make the substance adhere; others make it into a thick wash, and sometimes adding soft-soap. I have never yet seen good derived from these practices, but I have seen harm done to the Vines and the Grapes, both at the time, and the year following. The supposition is that sulphurous fumes are thrown off by the heated pipes, filling the vinery, which is kept close, and suffocating the "spiders," but in the majority of cases this is only partially effected; and often the cure is worse than the pest, as the foliage is disfigured by the fumes, which causes another kind of check to the Vine. The harm done the following year by the use of flowers-of-sulphur, as previously mentioned, is that known as "rust" of the Grapes, owing to the hot-water pipes not having been properly freed from sulphur used the previous year. It is surprising what a long time sulphur retains its peculiar properties. It may be cleaned off the plain lengths of the pipes, but if it still adheres about the sockets, flanges or joints, the fumes

given off by the heated pipes when the Vines are in bloom will cause the "rust." This is a fact, strange though it may seem to the inexperienced. I once lost many bunches of Grapes that were hanging in proximity to the hot-water pipes by this cause, and I would warn others in time of the consequences of not thoroughly cleaning sulphur from the pipes before starting the Vines anew. Borax is said to be a good antidote for red-spider if dissolved at the rate of 2 oz. to 1 gallon of water, syringing the affected parts with the solution. I have not, however, tried it, as I am no believer in syringing Vines at all after the bunches are set, and not very much previously. In fact, I go so far as to say it is not necessary to syringe Vines at all that are free from insect pests, not even to induce them to break regularly into growth, as is averred by most cultivators. If no thought be bestowed upon the appearance as regards the bloom upon the berries, spider may be kept in check by vigorously syringing the leaves from the underneath side every evening, but I fail to see how this can be done without spoiling the appearance of the berries. I have spent many hours in sponging leaves infested with spider with a mixture of tobacco-juice, water, and soft-soap, but I never saw a complete cure from this tedious kind of operation. It is also next to impossible to use a sponge without in one way or the other disfiguring the bunches. Since I have had sole charge of vineries I have discontinued sponging the leaves and rely entirely upon the dry flowers-of-sulphur to prevent the spread of red-spider. Seldom can a vinery be found in which hot-house plants in variety are grown, and often including French Beans and Strawberries in the forcing season, that is quite free from red-spider. I know we get a little from this cause, but the sulphur enables us to keep it sufficiently in check. The best implements for distributing sulphur are the Walbeck bellows, or the common india-rubber distributor, which dispense the sulphur in a cloud of almost impalpable powder, covering the affected parts of the leaves, and bringing it into direct contact with the insect. *E. M.* [The mite detests moisture, and it is a question if it cannot be prevented ascending the stems of the Vines by surrounding these with reservoirs of water, and also by means of a sticky smear such as is used on Apple trees. Ed.]

STANDARD APRICOTS RIPENING THEIR FRUITS.

—As an evidence that this is an extraordinary season, I may mention that in the middle of my garden stands an Apricot tree loaded with fine ripe fruit. The tree was brought from France about seventeen years ago, and (with the exception of a very little blossom one year) has never before shown any indication of fruiting. *B. G. Jenkins, 43, Chatsworth Road, West Dulwich, S.E.*

WASPS.—I notice in the *St. James's Gazette* of July 31 a letter headed "Plague of Wasps," stating that the coast between Hythe and Dungeness has become infested with wasps, and that at Dymchurch two sheep were stung in the throat and killed. Huntingdonshire and Cambridgeshire appear also to be specially troubled with these pests, and to such an extent, that the agricultural labourers have threatened to strike work from the danger of ploughing through the nests. As many as ten nests have been found in one field. Gilbert White (see his letter, "Z. X. W.") wrote that the great pests of a garden are wasps, which destroy all the finer fruits just as they are coming into perfection. "In 1781," he writes, "we had none, in 1783 there were myriads, which would have devoured all the produce of my garden had not we set the boy to take the nests, and caught thousands with Hazel twigs tipped with bird-lime. We have since employed the boy to take and destroy the large breeding wasps in the spring; such expedients have a great effect upon these marauders, and will keep them under." I suppose in these days it would be difficult to find boys able to find queen wasps in March, their time being absorbed in schoolwork. Only last night, July 30, an intimate friend of mine, who was sleeping at his father's house in the country, suddenly awoke in great pain, and with much swelling of the lower lip. The servant discovered in the morning a large wasp in the bed (the queen perhaps). I saw my friend in London to-day, the swelling reduced, but still there, and happily, he goes to Switzerland this week, when I hope all further trouble will be removed. Whilst at my favourite Selborne recently, I heard that turpentine was a good way of killing wasps. Their nests were unusually numerous this season. I remember in my boyhood tying bottles to Plum trees; bottles with wide necks, used for

preserving fruit whole. I half filled them with beer sweetened with sugar. Myriads of wasps were thus destroyed. One thing is certain: if their nests are not now invaded Plums and Pears will be reduced this and next month to a minimum. Until I had read Gilbert White's letter, I never before heard that bird lime had been used for wasp destruction. This exceptionally hot summer may have caused this great influx of wasps; still heat is not the only factor, for White distinctly wrote that in the summer of 1781, when the heat was intense, there were no wasps; but in the summer of 1783, when the heat was also excessive, there were myriads. *John Colbrook.*

ROOT-PRUNING FRUIT-TREES.—Is it strictly correct to state, as on p. 102 of *Gardeners' Chronicle* (article signed A. D.), "it is well known that free roots means free growth, and where the soil is deep and good, free growth means unbounded wood-production, and little fruit?" I think this is a statement it is necessary to accept with "great deductions." That this may be quite true of some sorts of Apples, Pears, and Plums, I am willing to admit, but it is so sweeping in its assertion, that my own experience forbids me to accept it without qualification. I have seen gardens in which the soil is of a deep rich loam, such as that which prevails in many orchards in Kent, Middlesex, and other fruit-producing counties, and in private gardens also, where trees make a very free growth, where but little, if any, root-pruning is done, and yet where plentiful crops of fine fruit are produced. I have in my own garden several large fruit trees, that, growing in a deep bed of fertile loam, make a free growth every year; the man who does my pruning, spurs these trees back every year quite close, and never root-prunes, and yet I get good crops of fruit. It may be bad culture, but the fact of fruitfulness remains. It is because I think the statement too sweeping that I venture to call attention to it. I have seen a good many starved fruit trees this season, whose roots were near the surface, and for want of moisture are valueless for the season. It is not always easy to mulch and water. It can be done on a small scale, and not on a large one, and it is more than probable had the roots been deeper in the soil, the results would be different. It is easy to dogmatise about fruit-culture, but conditions have to be considered—such as varieties, locality, climate, &c., and these are points of first importance. *Caution.*

—Mr. Crowley opened up a wide subject by his letter in the *Gardeners' Chronicle* of July 1. It is important to observe that this theory of root-pruning is founded to a certain extent on the true principle of fruit culture. As a tree finds nutriment by its roots, if the roots be cut off at 2 feet from the stem, the means of living are in great measure destroyed. In exposed situations the roots of a tree are more numerous, as well as stronger than in sheltered positions. It is supposed by some persons that the roots of trees, if of considerable age, have exhausted all the nutriment in the soil about them, and need to search for it at greater distances, and they will, indeed, travel to a distance equal to the height of the tree; and we are aware that roots and branches are co-extensive with each other, or rather that the spread of the roots exceeds that of the branches. My experience teaches me that so long as the tap-root or large descending roots are prevented from penetrating deeply into the soil, no root-pruning is required. These descending roots may be cut off, or laid horizontally. The mutilating method now practised of lifting trees when about six or seven years old, and in each alternate year afterwards cutting all the leading roots away at short distances from the stem, is a barbarous one, and I am not surprised at flowers and fruit falling off trees so injured. The nurseryman endeavours to send well-rooted trees out, but the planter, after a few seasons' growth, starts lifting and mutilating them, and so it goes on; and if you ask if the trees are going on satisfactorily, you are told that they are making too much growth. I fear that because some of the old school practise severe root-pruning, the younger men will follow suit, the same as in summer-pruning. *T. Goddard Hunt.*

—In reference to "E. M.'s" further contribution to the above subject (p. 69), I may assure him that I had no intention whatever to misquote what he said (see last vol. of the *Gardeners' Chronicle*, p. 666) in reference to the method of procedure followed by certain "unnamed" fruit cultivators, wherein "E. M." writes:—"I will go further, and say that in some cases these same growths, which ulti-

mately form spurs, never give aught but wood-buds (adding), I know some fruit-tree cultivators who cut away many of these growths clean to the base every year in June or July, instead of pinching in the orthodox manner, &c." Had "E. M." bracketed "current year's shoots" immediately after "these growths" (as he points out at p. 69 I ought to have done instead of spurs), it would have made his meaning perfectly clear, and have prevented my having unwittingly mistaken "these growths" for spurs. "E. M." has somewhat evaded my question as regards the summer management of wall trees—Peaches, Apricots, Plums, and Pears. The disbudding of Peach trees is done in spring, and the proper number of young growths necessary for the well-being of the individual trees, and for yielding fruit the following year, are tied to the wires in due time. Well, these self-same young shoots produce, as all practical fruit-growers know (although "E. M." seems to have forgotten the fact), an abundance of lateral and foreright growths during the summer months. The question which I wished and wish still "E. M." to answer is, Would he allow these summer growths to remain untouched until the autumn? Also, what would he do with similar growths proceeding from trees of the Apricot, Pear, Plum, Cherry, and Apple, growing against walls or espalier-trained? The fact of "E. M." not having any Apricots or espalier-trained trees in his garden is, in my opinion, no excuse for his evading the question regarding their summer management. "E. M." enquires "if I would pinch the shoots of the trees mentioned to induce the formation of fruit-buds?" My answer is, that I pinch them for the combined reasons set forth in the *Gardeners' Chronicle* for May 20, p. 606 (last volume), namely, to prevent a waste of force in the trees, to promote a balance of growth, and to induce the formation of fruit-buds; the free admission of direct sunlight to the trees necessarily attending the process of summer-pinching favouring alike a fruitful growth and the development and ripening of the fruit. *W. L. C.*

—I for one have been interested in what has appeared in the *Gardeners' Chronicle* on summer-pinching, as against the extension system, and seeing now what an important subject fruit cultivation is becoming, it is very necessary for those who have experience of the management of fruit trees to give their opinion to the world, so that the best methods of cultivating fruit trees should become better known. I have read Mr. Fish's articles on a variety of subjects for many years, and believe him to be, not only an excellent writer, but a thoroughly practical gardener, and one on whom you may rely for sound teaching; I must, however, differ from him on the subject of close-pinching and pruning. After years of experience in the management of fruit trees, I find that pinching and hard-pruning are detrimental to the productiveness of the trees, and I think "E. M." is right about extension. My belief is that for every gallon of Apples or Pears grown on the close-pruning and pinching methods, it is possible to produce a bushel by the extension method. Only a few days ago I was looking over about 20 acres of fruit trees, principally Apples and Pears, grown for market, which were planted from six to nine years ago, which afforded a fine case for extension methods, the trees being pictures of health and productiveness, being cropped with fruits from the ground to the top, and many of the trees 12 to 15 feet in height. This bit of orchard management was a capital object-lesson, and sufficient to convince the most prejudiced close-pincher. *C. P.*

MASDEVALLIA FRAGRANS AND M. ARISTATA.

—The recently issued Part (No. IV.) of the *Mono-graph of the Genus Masdevallia*, by Lord Lothian and Miss Woolward, contains drawings and descriptions of a new species, *M. fragrans*. The plant is a rather striking one, with large broadish leaves, and the open cup-like flowers (yellow) of the coriacea type. The delicate fragrance of the flowers, an uncommon characteristic for a *Masdevallia*, suggested the specific name. Its habitat is unknown. It was bought from Mr. Bull in 1887 under the name of *M. elephanticeps*, the resemblance between the leaves of the two species being very close, and it was not till it flowered in 1892 that the mistake was discovered. It is probable that the new species was imported along with specimens of *M. elephanticeps* which came from Ocaña in the province of Santander, Colombia. When in flower, the difference between the two plants is very marked; the shape and size of the massive flowers of *M. elephanticeps*, with their long

tails and the dark colouring of their lateral sepals, at once distinguishing it from *M. fragrans*, with its spreading yellow sub-equal sepals tapering into short fleshy tails. Another species of interest is *M. aristata*, Rodrig., unknown in this country either as living plants or dried specimens, but of which Señor Barbosa Rodriguez, Director of the Botanic Gardens at Rio de Janeiro, has supplied drawings, hitherto unpublished. The species was described in his *Genera et Species Orchidearum novarum*, and is allied to *M. intracta*, and also very closely approaches another Brazilian species, known from description only—*M. aurantiaca*. Señor Rodriguez discovered *M. aristata* in January, 1876, in the Province of

it differs in the valves of the capsule being opposite to the sepals, instead of alternate with them.

P. grandiflorum, the type form, occurs in China, Manchuria, Siberia, and Japan, and has also been called *P. sinense* and *P. autumnale*. It was figured in the *Botanical Magazine* so long ago as 1794, t. 252, and in the *Nerland's Plantentuin*, vol. 2, t. 1 (1866) as *P. autumnale*. The dwarf form known as *P. grandiflorum* Mariesi was introduced from Japan by Mariès, and a coloured figure of it appeared in the *Garden* of March 14, 1885.

Messrs. Vertegans of Birmingham, who send us

Bunyard & Co. If any have contributed more than others to make Kent the fruit garden of England, we should think those persons are the present proprietor and his father. Such an area of land is devoted to the growth of fruit trees, and such very large numbers of all the best varieties are always in stock, that we think at scarcely another nursery in these islands can so many be found. There are other first-class establishments, familiar to everyone, which have specialities in which they excel all others; but the great special feature here is the great extent of well-conditioned stock, which ensures the execution of the largest order, so far as regards standard varieties.

The constant additions which have been made for many years past have been maintained, and, even now, Mr. Bunyard observed, as he walked through the various groups of young trees, that they must still go on increasing their acreage and the variety of the stock, if they are to be prepared to meet the constantly increasing demands with which they are favoured. All this is very satisfactory to us, and others who desire to see the growth of hardy fruits extended. In some cases, provident landlords are furnishing their farming tenants with trees of the newer varieties gratuitously, a circumstance which will tend as much as anything to the more general planting of fruits on farms and holdings. We have already said that the drought had passed, and in travelling through the lovely county of Kent it was surprising to observe how soon the fields were being clad with greenery, and everything looked so fresh that one was almost inclined to the idea that Kent must have suffered less severely than other parts that we had seen recently. But in the gardens and orchards, with more careful observation than is possible when travelling by railway, the considerable amount of injury that has occurred is only too plain. In Mr. Bunyard's nursery, where the effect has been minimised by good tillage, we notice that in the case of some of the recently-moved fruit-trees they had not recovered from the check, and in some instances a year will have been lost. Young Plums, that usually make shoots 6 to 7 feet in length, have made 4, and in some cases only 3 this season; but these are just as well or better for that, as the new wood will be thoroughly matured by the end of the season. Indeed, the injurious effects of so trying a season as that of 1893 are not actually so serious as we should expect; it is not to the weather, however, but to Mr. Bunyard's exertions, that this is due. With what personal interest and sympathy he cultivates his trees, is easily noticed by the visitor as he discovers how thorough and exact is the knowledge Mr. Bunyard has of every part of this extensive fruit colony. All the various details in the methods practised here are under his supervision and direction, each consignment leaving the establishment also being subjected to the same skilful supervision—as good a guarantee as is possible that the fruit trees are all true to name.

As the various "drifts" of 60,000 or more maiden Apples on the Crab or the Paradise, and the larger specimens of two and three years are passed, it is impossible not to notice the exceptionally fine condition they present. Singularly enough, the trees are very free from the ravages of maggot and allied pests; and spider is considerably fewer in numbers than has been general during the present year. Aphis, perhaps, has been the most troublesome insect; but the harm that they are capable of is not so lasting as that of some of the other pests. We can only attribute this immunity from blight, as we must also the splendid and healthy character of the entire stock, to the attention paid to their requirements, and the skill with which they are managed. Digging to loosen the soil between the rows, and the use of the horse-hoe and "Planet" cultivator between them during the summer months, prevents evaporation of moisture by promoting a friable condition of the surface; and in those few instances where this kind of treatment has not been possible, the difference in the growth affords a correct gauge of its advantages. One of the most important operations connected

FIG. 33.—PLATYCODON GRANDIFLORUM, VAR. MAJESII: HARDY HERBACEOUS PLANT; FLOWERS RICH VIOLET-BLUE.

Mioas Geraes, "where it grows upon mossy rocks, and sometimes upon trees, in the dark, damp recesses of the foresta near Caldas." *A. B. Rendle*.

PLATYCODON GRANDIFLORUM, VAR. MARIESII.

We give an illustration of a plant lately exhibited by Messrs. Paul & Son at the Royal Horticultural Society, which attracted a good deal of attention from its dwarf habit and large deep violet-coloured flowers. The leaves are somewhat fleshy, dull green above, greyish green beneath. *P. grandiflorum* has received various names, but following Bentham and Hooker, the genus *Platycodon* is kept up as distinct from *Campanula* in its broadly cup-shaped flowers, the stamens dilated at the base, and its capsule opening at the top and not at the sides. From *Wahlenbergia*

specimens, say they have grown the plant for several years, and that it is quite hardy. "The bed in which the plants are growing is slightly raised, so that it is free from excessive moisture. In this situation the plants grow to a height of 12 to 18 inches. Although by no means a new plant, the Floral Committee acted wisely in certifying it as one of the best dwarf herbaceous plants."

NURSERY NOTES.

MESSRS. G. BUNYARD AND CO., MAIDSTONE.

It was nearly a fortnight after the long drought had given place to the first showers we have experienced this summer, that we went to Maidstone to see the extensive fruit nurseries of Messrs. Geo.

with the production of fruit trees, Mr. Bunyard rightly believes, is the grafting or budding. "For," said he, "as this is done carefully or not depends the length of life and the whole future of the tree." Consequently, this is one of the details over which his great experience is brought to bear.

It may be interesting to note that one variety of Apple to which this hot summer has been favourable is Lord Suffield; it has made splendid growth, free from canker, and the fruits on the young trees of one year old on the Paradise stock are many and large. A very large quantity of the variety Grenadier is in stock, as this is one of the Codlin class of Apples of which Mr. Bunyard thinks highly. Ecklinville, that large culinary variety, is present in very splendid condition, the "maidens" forming a perfect picture. Golden Spire exhausts our guide's superlative adjectives, so valued is it, and its wonderful cropping qualities are his justification. Then there is Lane's Prince Albert, fruiting very finely, but it is impossible to persuade the Prince to conform to conventional life; if let ramble a bit, fruit is produced freely enough. Gold Medal, said Mr. Bunyard, is one of the very best Codlins we have got, and we believe him. Then that extraordinary cropper, Peter the Great, or Cardinal, as it is sometimes called, comes under notice, and the character given it, is—early to ripen, good bearer, and a fine grower. A pretty Apple is Duchess of Oldenburgh, and it does well "anyhow." Tyler's Kernel, though not much known, is deserving of a trial in any collection.

In the trial-orchard are about 300 sorts; they are on the Paradise, and are kept dwarf, but they afford excellent fruits, and are tested before being propagated on an extensive scale. All the best sorts were seen here; and Washington, whose reputation for outside-work has not been very good, generally does well here. A large quantity of sorts specially suitable for market gardens, such as Yellow Ingestre, has to be kept, the demand for these being heavy.

What may be said to be another feature of the place is the large espalier, standard, and pyramidal fruit trees of several years old—in fact, as large as is usually necessary to furnish any vacant place.

Pears.—These are looked after with the same assiduous care as are the Apples, and present the same fine appearance. Beside the generally well-known varieties, there are many which Mr. Bunyard can recommend for more general planting. Madame Treve is one of these, an exceptionally good bearer, and succeeds on the Quince; its large, delicious fruits are ripe in September. Petite Marguerite is a fine American variety, also ready in September, but as yet little known here; Doyenné du Comice is a Pear not half enough known as a late sort; Duchesse de Bordeaux keeps well until February, is a good bearer, and of medium size, but there are few growers who possess it. Then we have to notice what an excellent crop is being borne by that early Pear, Rivers' Beacon; and Dr. Jules Guyot, said to be a capital Pear for marketing; in flavour much like Williams' Bon Chrétien, but it is a much better doer, and bears when the latter variety fails.

Stone Fruits.—Peaches are well cultivated as standards or wall trees, &c., and of any desired size. The wood of the Peach is especially well ripened in this district, and the trees are therefore suitable for planting in any other. They are carefully trained, and at the present time appear to be in fine condition. Of Plums and Damsons the same observations serve, for these as well as Cherries have the best attention paid to their culture; indeed, each is present in large numbers. "Plum Belle de Louvaine," says Mr. Bunyard, "has gone out of many collections, in spite of its being very worthy of retention." Belle Normandie is given a very good character, and then we come upon two others, which require no further recommendation from us—these are Rivers' Prolific and Rivers' Czar, but we shall have to refrain from further notice of these after we have given a word to the Myrobalana Plum, which was very attractive; the trees had been grafted, and carried two kinds of fruit, the yellow and red, with which the trees were literally covered.

Orchard-house.—These houses were filled with trees in pots, of the Apple, Pear, Peach, and Nectarine. The aim in regard to these is to produce healthy trees of good form without unduly stimulating them with manures, as the less this is done, the better for the trees, for in regard to young trees of any description, excess of stimulation is necessarily injurious. The trees are not strictly pyramidal in shape, but are allowed to make some amount of free growth, although the shape is considered as far as is practicable. They may be seen in batches, one, two, and three years old mostly, but some are older. Hale's Early, and a few of the other early Peaches were carrying ripe fruits. Dagmar is a favourite here, and so is the Nectarine Peach, as a late bearer; Gladstone is regarded also as one of the best amongst the late varieties; a good doer, either outside or in the Peach-house. Most of the varieties now popular with growers were present, in addition to those mentioned, and of Pears and Apples too. One house was full of Fig trees in pots, and Mr. Bunyard said there was a good demand for these, but we venture to think it is nothing like what it ought to be, seeing the great fruitfulness of the Fig when properly managed, and the lusciousness of its fruits. Unfortunately, the cultivation of the Fig is not so generally understood as that of other fruits. We often see the trees planted in some badly-lighted position—the back wall of a vinery, or other such ludicrous, unsuitable place. In a small Apricot-house, Mr. Bunyard thinks he has found the secret of their culture to be in keeping them very dry during the winter. The trees are looking fairly well, and are carrying ripe fruits.

Strawberries, &c.—These are grown in immense numbers, and in variety; and the Raspberries grown include a stock of the Superlative, a capital variety, pretty well known to growers by this time; a wonderful cropper, and robust grower; its large fruit is all that could be wished.

Shrubs, Roses, and other general nursery stock are kept in large quantities at these Maidstone nurseries, where most kinds and varieties of these plants can be supplied; and the firm's rule of thoroughness extends to these as well as fruit trees. A large local florist's trade is done, and many houses are devoted to supplying the demands upon this part of the business. The total area now under these several stocks in the three nurseries is 125 acres, and there are about fifty houses of fruit trees and general florist's plants.

SCOTLAND.

EAST OF SCOTLAND UNION OF NATURALISTS' SOCIETIES.

THIS week (July 29) saw the close of the tenth annual conference of the East of Scotland Union of Naturalists' Societies at Kirkcaldy. Among those present on the opening day were the president, Professor d'Arcy W. Thompson; the president-elect, Mr. James Shepherd; the hon. general secretary and treasurer, Mr. William D. Lang, C.E.; and the hon. local secretary, Mr. T. P. Strachan. The societies comprised in the union were well represented at the council and general meetings by delegates.

The general meeting took place immediately after that of the council in the large hall, at which there was a large attendance, including a goodly number of ladies. The president-elect, Mr. James Shepherd, called upon Mr. Lang to read the minutes of last conference held in Dundee. This over, the meeting fixed the next annual conference to be held in Dundee. Mr. Shepherd, in an able address, alluded in feeling terms to the White Centenary, held at Selbourne, Hants, on the 26th of June last. He then dwelt at length on the social advantages to be gained from the study of Nature as a healthy recreation, and his remarks were listened to with great attention. During the Conference papers were read by Dr. David Lonsdale, on "The Fife Coal Field;" "On the Antiquities of Falkland," by Mr. John Kinross, A.R.S.A., and Major Wood—read by the latter; "The Beatitudes of Breadalbane," by Dr.

Buchanan White—read by Mr. Strachan, giving very useful information; "A Note upon Photography as an Aid to Scientific Work," by Mr. Storrar; "On Plants of the Kirkcaldy District," by Mr. W. S. Blackstock, F.R.S.; "A Note on the Loch Leven Fern," by Mr. Peter Ewing; "A Note on *Tridentia europæa*," by Mr. W. Wilson, &c. A banquet was given in the George Hotel on one of the evenings, at which nearly one hundred persons were present; and various excursions were made during the week, and instructive information was imparted and obtained.

GLASGOW AND WEST OF SCOTLAND PANSY SOCIETY.

On Wednesday, the first annual exhibition competition under the auspices of the Glasgow and West of Scotland Pansy Society, took place in the Trades' Hall, Glasgow. For a first exhibition, the display was excellent, and compared very favourably with any show yet seen in the West of Scotland. The entries numbered 455, and comprised some very fine specimens of Violas, Pansies, Roses, and herbaceous plants. Messrs. Dobbie & Co., of Rothesay, had about 100 exhibits, the Sweet Peas and Pansies in this admirable collection being quite a feature. Mr. G. Stuart, Rothesay, had some really good plants, which attracted considerable attention. Mr. Andrew Irvine, Tigh-na-bruaich, had a splendid collection of blooms of show Pansies, for which he received the 1st prize, a Silver Medal. Messrs. W. Paul & Co., Bridge-of-Weir, obtained a 1st prize for a very pretty collection of Violas. Messrs. D. Montgomery, Mount Vernon; Halley Bros., Perth; and Wm. George (gr. to Mrs. Macqueen, Gateside), Drymen, were also amongst the prominent exhibitors.

The following is a list of the principal prize-takers:—

Pansies and Violas (confined to nurserymen).—Twenty-four blooms of show Pansies, distinct varieties: 1st, a Silver Medal, Andrew Irvine, Tigh-na-bruaich; 2nd, John Smellie, Bushby.

Twenty-four blooms fancy Pansies, distinct: 1st, Silver Medal, Andrew Irvine; 2nd, J. Smellie.

Twenty-four bunches Violas, six blooms in each, distinct varieties: 1st, Wm. Paul & Co., Bridge-of-Weir; 2nd, J. Smellie.

Open to Gardeners only.—Twelve blooms show Pansies, distinct: 1st, G. Stuart, Rothesay; 2nd, John Harper, Dumfries. Fancy Pansies: 1st, R. Stuart. Bunches Violas: 1st, A. Gilchrist.

Confined to Amateurs.—Twelve blooms show Pansies: 1st, Andrew Frater, Linlithgow; 2nd, A. Brown, Lenzie. Six blooms show Pansies, distinct: 1st, Walter Buchanan, Torrance of Campsie; 2nd, A. Frater. Twelve blooms fancy Pansies: 1st, Archibald Watson, Busby; 2nd, Alex. Bruce, Lenzie. Bunches Violas: 1st, James Paul.

Open to Gardeners and Amateurs only.—Fancy Pansies: 1st, A. Frater. Blooms show Pansies: 1st, W. Buchanan. Eighteen blooms, fancy Pansies: 1st, A. Frater. Twelve blooms, fancy Pansies: 1st, A. Frater. Blooms, Show Pansies: 1st, J. Stuart. Blooms, Seedling Pansies: 1st, W. Buchanan.

Pinks, open to all.—Blooms, Pinks: 1st, W. Campbell.

Confined to Gardeners and Amateurs.—Twelve blooms Pinks: 1st, A. Gilchrist.

The competition in seedling blooms of all kinds of Pansies and in herbaceous plants was extensive and meritorious.

TWO GREAT SHOWS AT EDINBURGH.

The Highland Agricultural Society opened its exhibition on July 25, at Comley Bank, Edinburgh, and it was agreed on all hands that in point of excellence in every department the show was one of the best the Society has held. In the early part of the day the weather was dull and showery, but as time went on, the sun shone out with great brilliance. Attractive as all the classes were, the exhibition was much enhanced by the horticultural products, as machines, seeds, grass (in miniature lawns), trees and shrubs, and glass erections. Messrs. Webb, of Wordesley, Stourbridge, were strongly represented by their choicest roots, grass (green), and dried

grasses and cereals. Close to the ornamental stand of this firm was that of Messrs. Little & Ballantyne, Carlyle, with a fine display of horticultural and agricultural necessaries. Messrs. Dickson, Brown, & Tait, Manchester, had fine exhibits; their early Potatoes created much interest; Sharpe's Victor was riper than any of the other of the fine varieties tabled. They were large, well-formed, and appeared to be of fine quality. This variety is one of the best for forcing either in pots or otherwise (I dug good examples during the first week of June this season). Jeannie Deans, Sutton's Prizetaker (a red kidney), and Ringleader Kidney, among others were in fine form. Their Turnips, grasses, and seeds, were also well represented. The large Scottish seed firms were not well represented generally beyond their commercial interests. But some of the local nurserymen sent their quota (as well as to do honour to another great show held in Cowley Park, the Grand National Carnival and Floral Fête). Messrs. James Dickson & Sons, Edinburgh, and Messrs. Methven & Sons, of Edinburgh, showed choice Coniferae well among the buildings of the agricultural exhibition. The plants being either in pots or lifted with good balls of roots, stood the treatment to which they were subjected remarkably well. They were dwarf, compact, and with striking foliage—*Retinosporas* and *Cupressus* in their varieties were strongly represented.

Messrs. J. Dickson & Sons had a charming arrangement in the shed set apart for dairy produce. Their choicest grasses were exhibited on a green bank raised in the centre, and sloping to each side, and running the whole length of the building. The green sward was dotted with single plants of *Aspidistras*, *Aërideas*, *Dracenas*, Palms, *Ficus elastica*, and other graceful plants which were much admired. Turning outward from the agricultural exhibition, we entered the "Carnival" grounds, which were of the gayest description (as fancy fairs generally are). The object of holding such an exhibition was to give tangible effect to a philanthropic scheme, viz., the Edinburgh Institution for Incurables, and the Royal Maternity and Simpson Memorial Hospital. The excellent taste evinced in the laying out of the grounds was particularly striking, and the clever placing of the trees in sweeping avenues, in order not to impede the traffic from the crowds of visitors, is worthy of notice. The arrangements for entertainments being specially kept in view, necessitated careful planning of the ornamental grounds. The attractions of the amusements and articles on sale, in tents of many sizes and forms, drew together immense crowds, but horticultural objects were superior to all other attractions. They were in charge of the Marchioness of Tweeddale and her ladyship's brilliant army of lady assistants, who handled the flowers and pot plants deftly, and gracefully offered them to all and sundry who had cash to spare.

We noticed large collections of Carnations and Picotees, many of them named; prominent among these were Mrs. Muir, Germania, James Brown, Mr. Jack, Mrs. L. Jamieson, Scarlet Gem, Marnie Murray, and Miss Peacock.

Entering a large tent, we found a collection of Conifers in fine health and of very striking appearance, arranged for effect, well contrasted with the bunches of cut flowers arranged for sale. The Conifers came from Messrs. Smith, of Darley Dale, Derbyshire. Long boxfuls of cut Roses were exhibited from Messrs. Smith, of Stranraer Nurseries, Mr. Cuthbertson, Rotheay, had a long table loaded with choice herbaceous plants in bunches. Phloxes, Gladioli, Lilliums of species, were placed among the cut flowers prominently for effect. Among the plants a group of choice Coniferae, and plants with striking foliage was set up by Messrs. Fraser, Comley Bank Nurseries, which had a telling effect. Mr. Phillips, Granton Road Nurseries, had a beautiful group of *Araucaria excelsa*, with fine-foliaged plants for a border to it. Mr. Campbell, High Blantyre Nurseries, had a telling display of Carnations, many of them seedlings growing in pots. Large Camellias came from Messrs. Laird & Sons, and afforded a background to the long table of flowers. *M. T.*

NOTICES OF BOOKS.

HANDBOOK OF THE FLORA OF NEW SOUTH WALES, ETC., by Charles Moore, F.L.S., assisted by Ernst Betche. Sydney: 582 pp.

THE veteran Director of the Botanic Garden, Sydney, to whom horticulture and botany owe already so much, has added to the obligation by the publication of this useful Handbook. It is on the plan of the colonial floras, and specially of the *Flora Australiensis*, that remarkable product of the genius and zeal of Bentham and Mueller. A preface to the present work summarises the history of botanical research in this part of Australia, as told by Sir Joseph Hooker. When, however, in 1847 Mr. Charles Moore, the author of the present book and the brother of the renowned David Moore, of Glasnevin, was appointed Colonial Botanist and Director of the Botanic Garden, he found not a vestige of the herbaria formed by his predecessors. Those who have visited the garden are warm in their expression of its condition and beauty, whilst botanists are able to appreciate the yet more enduring work done by Mr. Moore. They will doubtless concur that he has done no more serviceable work than this Handbook. The author acknowledges his indebtedness to Baron Sir Ferdinand Mueller, whose arrangement of the orders is followed, as being a nearer approach to the natural disposition than the Candollean sequence generally adopted in the other colonial floras. It is rather startling to find Piperaceæ placed next to Nymphaeaceæ, but botanists will remember that the seeds of the two orders present remarkable characters in common, a point by the way not sufficiently brought out in the account of the Peppers (Piperaceæ) in the present volume. So long as the arrangement is understood, it is, for practical purposes, of little moment which of the so-called natural arrangements is followed. Especially is this the case in view of the fact that the study of comparative embryology which must occupy the attention of the philosophic botanists of the future, will undoubtedly result in a great shifting and rearrangement. A list of authors, a full glossary or explanation of technical terms, an explanation of the meaning of species-names, an appendix containing a list of the plants of Lord Howe's Island, of Norfolk Island, another comprising a list of introduced weeds, and a full index, are all signs of the pains that have been taken to render the book useful to students. The intrinsic value of such a book can only be tested in actual use as circumstances arise, but the plan of the book, and the great pains evidently taken in its elaboration, afford a good guarantee (even apart from the author's long experience and well justified reputation), that the reader will find what he wants in the readiest manner and in the most correct form. The account of the Orchids was revised by the late Mr. Fitzgerald. We have little doubt that a re-issue of so useful a work will sooner or later be called for, in which case a slight sketch of the physical geography and climatal features of the colony, and a map, would be welcome additions to European students.

MECHANICAL WORK IN GARDEN AND GREENHOUSE. Edited by Francis Chilton Young (Ward, Lock, & Bowden).

This is an excellent little treatise for the amateur gardener, or for the young practitioner. The first part is devoted to geometry for gardeners, a subject

but little studied by them, but most useful. We have never seen geometry more clearly and usefully treated than in this unpretending little book.

The chapter on sundials and dialling contributed by Mr. Arthur Yorke, is interesting, but in these days of Waterbury watches not so practically useful as in former times, and Mr. Yorke is careful to remind us that the sun is not so good a time-keeper as a watch or a clock, for reasons well known to the astronomer. The last section of the book is devoted to the construction of greenhouses and other garden edifices, and will be found serviceable by amateurs and those who aspire to be their own builders.

A HANDBOOK TO THE FLORA OF CEYLON, &c. By Henry Trimen, M.B., F.R.S. With an Atlas of Plates. Part I. Ranunculaceæ—Anacardiaceæ. Svo. Pp. 327. (Dulau & Co.)

Botanists have been long waiting for a flora of Ceylon. Gardner, and especially Thwaites, laid the foundations of such a work, whilst the successive volumes of the *Flora of British India* have comprised Cingalese plants, as well as those from other parts of our great Indian dependency. A separate Flora of Ceylon is, however, a great desideratum, especially to residents in the island, and this desideratum Dr. Trimen is specially well qualified to supply. In plan this volume follows the lines of the *Flora of British India*, the descriptions of plants being in English. No name earlier than 1753, when Linnæus first definitely published his binomial nomenclature, is accepted. The adopted names of species are followed by a reference to the author who first described them, and the date of publication. Synonyms are duly recorded, and references given to the literature of the subject, and to the local and general distribution of the plants. The coloured plates comprise a selection from several thousand figures, made under the direction of successive Directors of the Botanic Garden by three members of one Singhalese family—De Alwis. A sketch of the climatic regions of Ceylon is given, and the island shown to be divided into three main regions, distinguished by varying amounts of rain and temperature, viz., the dry low country region, the moist low country region, and the montane or hill country. Four-fifths of the island belong to the first region, where the vegetation is mainly that of peninsular India. The moist low country region, though occupying less than one-fifth of the area, is the best known, and the most interesting. Dr. Trimen assigns to it a limit in altitude of 3000 feet, all above that being included in the montane region. This district has a rainfall of from 75 to 200 inches in the year, chiefly in May and June. A short dry period occurs in the first quarter of the year, and again in August and September. This wet tropical region is the home of the bulk of the endemic species, and has a strong Malayan affinity. The montane region above 3000 feet, up to 8206 feet on Pedurutalagala, is wholly in the moist region, and south-west of the centre of the island. The descriptions seem to be particularly clear, and the typographical arrangements excellent, so that the work of the student is greatly facilitated.

No doubt when the work is completed, an index and a map will be provided. The volume is so indispensable to all those concerned with the Flora of Ceylon that we hope succeeding volumes will be speedily issued.

PLANT-ATLAS TO MY WATER CURE, ETC., by Sebastian Kneipp. (London. H. Grevel & Co. 33, King Street, Covent Garden).

This little book illustrates a very curious phenomenon. As evolution and progress go on in one direction, so do degeneration and retrogression go on in the opposite:

"Evolution ever climbing after some ideal good,
And Reversion ever dragging Evolution in the mud."

We much prefer the spirit of the earlier to that of the later Locksley Hall, and the buoyant hope of the one is pleasanter and at least as true as the querulous whine of "sixty years after." Still, it is

curious to observe that, at a time when the reproach that doctors pour physic of which they know little into a body of which they know less, is daily becoming less and less justified—that at such a time we have a book which plunges us at once into the dogmatic quackery of the middle ages. A perusal of the details relating to the “use” of the several plants figured in this little book reminds us of the old herbals. This is good for that complaint, and this other is serviceable for that, but there is no attempt at explanation of the reason why, no setting forth of the chemical constitution, or the mode of action which render this herb serviceable in this or that disorder. A headache, for instance, may arise from one of a dozen different causes, each requiring separate treatment, but such considerations are overlooked in this volume. This is not of so much consequence to the patient, who must exercise faith, but the conscientious doctor, who has to exercise reason and judgment, is left entirely without other guidance than the unsubstantiated assertion of the author. We know that there is much virtue in fresh air, pure water, proper diet, and wholesome life, such as we believe Pastor Kneipp, in common with the faculty at large, prescribes, and we are not at all inclined to doubt that there is much efficacy in “herbs, and other country messes,” under certain circumstances, but from an author we require something more than mere assertion. The plates are photographic representations of medicinal plants. We do not share the opinion of the publishers that photography has been made use of for botanical purposes for the first time in this book (dated 1891!), nor are we convinced, that for such purposes as are intended to be served by this book, coloured photographs are at all suitable.

SOCIETIES.

NATIONAL CHRYSANTHEMUM.

JULY 21.—A special meeting of the General and Floral Committees took place at the Royal Aquarium on the above date, Mr. R. Ballantine in the chair, there being a large attendance. Some very interesting correspondence was read from Wellington, New Zealand, giving an account of the arrival there of the frozen flowers sent out by the National Chrysanthemum Society last winter, namely, a dozen fine incurved, from Mr. Mease, The Gardens, Downside, Leatherhead, with which he won the Cup at Kingston; and a dozen of the fine Japanese varieties with which Mr. W. H. Fowler, Mayor of Taunton, won the Holmes Memorial Challenge Cup at the Aquarium in November last. The flowers reached Wellington a few days after the annual exhibition of Chrysanthemums was held; but a special show took place at which the frozen blooms were exhibited, and a large number of persons paid for admission. The English-grown incurved flowers were much admired on account of their perfect form; no flowers were ever before exhibited in the city so perfect. The Japanese blooms were also much admired, and finer examples of W. W. Coles, Mrs. C. H. Wheeler, and Avalanche had never been seen in Wellington. Mrs. Fogg and Lord Brooke being new to the Antipodean growers, were much admired. With one or two exceptions, the frozen flowers retained their perfect colours; but in the case of Edwin Molyneux and Mrs. C. H. Wheeler, all the yellow or gold had gone quite out of the petals, the only tint of colour shown being a dull-red, and the locally-grown blooms of these varieties went in just the same character, the season having been a very moist one. Such of the frozen blooms as Stanstead White, Mrs. Fogg, Lord Brooke, Sarah Owen, Etoile de Lyon, and Mons. Bernard were just as perfect in colour as when cut. After being exhibited at Wellington, the frozen blooms were sent on to Christchurch, and so much interest was excited over them in the colonies that applications were received from several societies for blooms to be sent for exhibition. The English blooms were sent to Wellington frozen in two large blocks of ice, the cooling having been accomplished with so much skill and care, that only in the case of one bloom did air-bubbles interrupt the view through the transparent ice.

The Chrysanthemum season at the Colonies proved a disastrous one; the weather was rainy and

misty nearly the whole time the blooms were out, so that they damped in a most alarming manner. One portion of the business of the committee was to inspect some frozen Japanese Chrysanthemums—four in number—which were grown by Mr. R. Forsyth, Sydney, a leading Australian grower. The blooms were very fine, each one having been separately frozen in a block of ice; the varieties were not named, but they appeared to be established sorts. The Silver Medal of the Society was awarded to Mr. Forsyth for his interesting exhibits. Twenty new members were elected, including two Fellows, and the proceedings closed with a hearty vote of thanks to the chairman.

ACTON HORTICULTURAL.

JULY 26.—By permission of A. Hubbard, Esq., the twenty-sixth annual exhibition took place on the above date, in the grounds of Derwentwater House. The large gardens in the district which existed during the early years of the Society have given way to the all-devouring builder, affecting the competition in particular classes; nevertheless, a fairly good display was made on the present occasion. For a group of stove or greenhouse plants, arranged for effect, Mr. G. Benham, gr. to R. O. Davies, Esq., secured 1st honours for a pretty arrangement; 2nd, Mr. T. Butcher, gr. to Mrs. Toynbee; the latter exhibitor taking the 1st place in the classes for four Fuchsias and two Fuchsias—good examples. In the specimen foliage plant class, Mr. Butcher likewise secured the premier position for a fine *Latania borbonica*. Mr. Polley, gr. to A. Hubbard, Esq., was the most successful exhibitor of Ferns, whilst bouquets were successfully shown by Mr. G. Sizmur, gr. to W. C. Smith, Esq. In the ladies' classes for floral decorations, the most successful exhibitors were Mrs. Green, Mrs. Hunt, Miss Edith Hunt, and Mrs. Roberts. Black and white Grapes were well shown by Messrs. Butcher, Chandler, Polley, and Wilks. The cottagers' display was extremely good, considering the season.

A few non-competitive exhibits are worthy of note, as a fine group of flowering and foliage plants, very effectively arranged, and contributed by Mr. G. Reynolds, gr. to the Messrs. Rothschild, Gunnersbury Park; a similar group from Mr. Cooper, gr. to E. M. Nelson, Esq., Hanger Hill House; some fine cut Roses from Mr. Will. Taylor, Osborne Nursery, Hampton; and a good collection of cut flowers from Mr. Denison, gr. to T. A. Gledstanes, Esq., Manor House.

TREES AND SHRUBS.

EUCRYPHIA PINNATIFOLIA.

To regular visitors at the Royal Horticultural Society's meetings in the Drill Hall, Westminster, this hardy shrub will now be well known, flowering branches having on several occasions been exhibited there by Messrs. Veitch. That it is hardy (at least, near London) is proved by its having been grown in the open at Coombe Wood for many years; also at Kew, where it is perhaps less favoured in regard to shelter. Several plants in a small bed near the Cactus-house there are at present in flower. They are 3 to 4 feet high, the leaves being opposite, pinnate (consisting of either three or five leaflets), toothed at the margin, and of a dark glossy green. The flower is about 3 inches in diameter, the petals being four in number, of cuneate outline, and pure white. A prominent feature of the flower is the cluster of numerous stamens in the centre, reminding one greatly of a *Hypericum*. For gardens in the South of England, this plant may be strongly recommended, not only for its beauty, but also as one quite distinct from anything else in bloom at this time (see *Gardeners' Chronicle*, September 11, 1880, p. 337, with figure).

The position of the genus *Eucryphia* appears to be doubtful, different authors having placed it under *Hypericaceæ*, *Rosaceæ*, and *Saxifragaceæ*. Four species are known to belong to it, two hailing from Tasmania, and two (including *E. pinnatifolia*) from Chili. Like *Fuchsia*, *Veronica*, *Libertia*, and other lesser-known genera, it illustrates the remarkable affinity existing between the flora of Chili and that of New Zealand and Tasmania, although the immense Southern Pacific rolls between. *W. J. B.*

A GOOD HOT-WEATHER SHRUB.

Variiegated shrubs, as a rule, have had a poor time this year. The sun quickly burns the foliage if much variegated, leaving it spotty and damaged. But when in Mr. Anthony Waterer's nursery at Knapp Hill recently, we noticed that *Cornus Spathi*, a very handsome variegated shrub, had stood the sun well—in fact, was untouched. This is important, and makes this form of greater value. *V.*

THE ORANGE CULTURE IN FLORIDA.

A VERY interesting communication on Orange-tree blight and the cultivation of Oranges in Florida has recently been made from New Orleans to the Foreign Office. “Many persons,” it is said, “who have hitherto taken pride in their Orange trees have been grieved to see them sicken and gradually die without apparent cause. Close examination will disclose the fact that the bodies of the tree, their branches, and even many of the leaves are covered with a brownish substance, which might be mistaken for dust; attempt to brush it off, and it will be found to adhere closely, in the form of minute scales. When hatched, the young insects move about for a while, then attach themselves to the tree, and form the scale over the bodies, and literally suck the life from the tree, attacking the lower branches first. Twice a year (spring and fall) they send forth broods of young, when the old insect dies, and at such times the scale is found dry, loose, and easily washes off. Then the young insect can be seen by good eyes, but an ordinary microscope will show scores, if not hundreds, of the young to each square inch, actively running about. While the insect, when encased under the scale, is hard to kill by any safe application, when young and exposed they may be easily destroyed by the following simple emulsion, which was first recommended by Professor Riley, the Government entomologist.

“The remedy is: one bar of soap, dissolved in 1 gallon of boiling water, to which add while yet hot, 2 gallons of coal-oil. Immediately churn by violent agitation in a demijohn; or, better still, by a hand force-pump, in an open vessel, and in a few minutes it will become thoroughly mixed, and assume a creamy consistency. Test it on a pane of glass, and if it adheres without being oily, it is ready for use as soon as cold, but before applying to the tree it should be diluted with nine parts of water to one part of the emulsion. After thoroughly shaking, it may be applied with a brush to every part of the tree which can be reached, but a better plan is to attach a spraying-nozzle to the force-pump (often used in gardens), and thoroughly spray body, branches, and leaves. The young insects are now moving about, and one application will kill most of them. However, as a matter of precaution, the trees should be sprayed with this emulsion two or three times, a few days apart.”

Referring to Orange culture in Florida, it is stated that the crop has reached such large proportions, that for some time past the growers have been looking elsewhere for new markets. Last year the State produced 3,500,000 boxes; this year's crop amounted to 3,000,000 boxes. It is said that the Florida Oranges has driven, or is driving, the Spanish and Italian product out of the American market, and that besides this, a large trade has been commenced in Europe.

A short time ago, a shipment of Oranges, amounting to 9566 boxes, was made to Liverpool. The shipment was by a British steamer. The vessel had a stormy passage, which caused the fruit to reach England in a more or less damaged condition. The said fruit, however, sold at such good prices as to leave the shippers a handsome profit. The shippers of this cargo propose to put on a regular line of fruit-carriers from Florida to England, and ports on the Continent. It is thought that from 100,000 to 300,000 boxes will be shipped to Europe next year.

Obituary.

WILLIAM THOMSON.—We greatly regret having to record the death of Mr. William Thomson, Junior, of the Tweed Nurseries, Clovenfords, Galnshields, N.B., which took place at that place on Sunday morning, July 30, in the forty-fourth year of his age. The deceased was born at Wrotham Park, near Barnet, on December 20, 1849, and when his father removed to Dalkeith in 1855, he was sent to the High School of that town, but he finished his education at the High School of Edinburgh. The secretary of the National Bank of Scotland offered, unsolicited, to take him into that Bank, which he entered, and made rapid progress, but he got tired of a sedentary life at the end of seven years, and when his father, Mr. W. Thomson, started the business at Clovenfords, he went there in 1869, and devoted himself with enthusiasm to acquiring a knowledge of horticulture, especially the cultivation of the Vine and Orchids; and of the methods of culture and the qualities of the latter he had a very extensive knowledge. He was respected by all who knew him well as a kindly, genial, and upright man. He had great physical strength, and an imposing presence, and wherever he went he made friends, not having a spark of meanness in his composition. He took influenza about a year ago; his family were laid up, and got well, but he determined to brave it out, and the result was that he had a bad attack of muscular rheumatism; from this he recovered in May, but was seized with pleuro-pneumonia, to which he succumbed. The funeral took place on Wednesday, August 2, at Clovenfords churchyard. He leaves a widow, two sons, and two daughters to mourn their loss.

THE PAST WEEK.

The following summary record of the weather for the week ending July 29, is furnished from the Meteorological Office:—

"The weather continued unsettled, with cloudy skies and somewhat frequent rain, in nearly all parts of the kingdom until Wednesday. On Thursday and Friday, however, the conditions were finer, and a fair amount of sunshine was experienced. Thunderstorms occurred in some parts of Scotland on Monday, and over the midland, eastern, and south-eastern parts of England on Wednesday.

"The temperature did not differ materially from the mean over Scotland and the greater part of England, but slightly exceeded it in Ireland, as well as in 'England, S.W.' The highest of the maxima were registered either on the 24th or 28th, and ranged from 76° in 'England, S.' and 'Ireland, N.,' to 70° in 'Scotland, W.' The lowest of the minima were recorded, as a rule, during the early morning either of the 23rd or 28th. They varied from 51° in the 'Channel Islands,' and 47° in 'Ireland, S.,' to 41° in the north-east of Scotland and the north-east of England, and to 40° in the 'Midland Counties' and 'Scotland, W.'

"The rainfall exceeded the mean in 'Scotland, W.,' and just equalled it in 'England, S.,' in all other districts there was a deficit.

"The bright sunshine was less than the mean over the greater part of the kingdom, but slightly exceeded it in Ireland, the south-west of England, and the north of Scotland. The percentage of the possible duration ranged from 47 in the 'Channel Islands,' 43 in 'England, S.W.,' and 40 in 'England, E.,' to 26 in 'Scotland, N.' and 'England, N.W.,' and to 25 in 'Scotland, W.'"

PLANTS IN POTS.—AVERAGE WHOLESALE PRICES.

POTATOS.

Supplies still continue heavy, and prices lower, except for fine samples, Snowdrops and Hebrons, which realise 6s. 6d. to 7s.; other kinds, 4s. to 5s. 6d.; ordinary, 3s. to 3s. 6d. J. B. Thomas.

SEEDS.

LONDON: August 2.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., report a quiet inquiry for Trifolium: it is too early yet for any great demand. New winter Tares realise thus far extreme prices. Giant Seed Rye, on the other hand, is good, abundant, and cheap. For Italian Rye-grass there is a lively sale. White Mustard is dearer than it has been for very many years. Choice new Rapeseed is obtainable on very moderate terms. Canary seed moves off slowly at former rates. There is no change in Hempseed. Peas and Haricot Beans dull.

FRUITS AND VEGETABLES.

BOROUGH: August 1.—Quotations:—Cabbages, 3s. 6d. to 6s. per tally; Parsley, 1s. 6d.; Carrots, 2s. 6d. to 4s.; Turnips, 2s. 6d. to 4s. per dozen bunches; Onions, Egyptian, 4s. 6d. to 5s. per cwt.; Cherries, 4s. to 5s.; Plums, 3s. to 5s.; per half-sieve.

SPIALFIELDS: August 1.—Quotations:—Cabbages, 3s. 6d. to 6s. per tally; Turnips, 2s. 6d. to 4s.; Carrots, 2s. 6d. to 4s. per dozen bunches; Onions, Egyptian, 4s. 6d. to 5s. per cwt.; Cherries, 4s. to 5s.; Plums, 3s. to 5s. per half-sieve.

STRATFORD: Aug. 1.—There has been an excellent supply of all kinds of produce at this market during the past week, and a brisk trade was done at the undermentioned prices:—Cabbages, 2s. to 4s. 6d. per tally; Cauliflowers, 6d. to 1s. per dozen; Carrots, household, 1s. 3d. to 2s. 6d. per dozen bunches; Onions, Egyptian, 5s. to 6s. per bag; do. Bordeaux, 6s. to 7s. per case; Plums, 2s. to 5s. per flat; do., 2s. to 2s. 6d. per half-flat; Grapes, 4s. to 5s. per flat; do., 2s. to 2s. 6d. per half-flat; Apples, 2s. to 4s. 6d. per flat; do., 3s. to 4s. per pad; Vegetable Marrows, 1s. 6d. to 2s. 6d. per pair.

FARRINGTON: Aug. 2.—Quotations:—Cabbages, 3s. 6d. to 6s. per tally; Onions, Egyptian, 4s. 6d. to 5s. per cwt.; Carrots, 2s. 6d. to 4s.; Turnips, 2s. 6d. to 4s. per dozen bunches; pickling Cabbages, 1s. to 1s. 6d. per dozen; Cucumbers, frame, 2s. to 2s. 6d. per dozen; Carrots, 60s. to 66s. per cwt.; Marrows, 1s. 6d. to 2s. per dozen.

FARRINGTON: Aug. 3.—Quotations:—Apples, 3s. per bushel (Lord Sutton); Pears, 3s. to 3s. 6d. do.; Plums, 1s. 6d. to 3s. 6d. per half bushel; Tomatoes, English, 4½d. per pound; Melons, 7s. per case; Cucumbers, 3s. per dozen.

POTATOS.

BOROUGH: August 1.—Quotations:—New: 5s. to 7s. per cwt. SPIALFIELDS: August 1.—Quotations:—New: 5s. to 7s. per cwt.

STRATFORD: August 1.—Quotations:—Hebrons, 100s. to 105s.; Snowdrops, 100s. to 110s.; Kidneys, 80s. to 90s.; Magnum Bonum, 90s. to 100s. per ton.

FARRINGTON: August 3.—Quotations: Hebrons, red, 100s. to 110s.; do., white, 100s. to 110s.; Regents, 90s. to 100s.; Snowdrops, 110s. to 120s. per ton.

LONDON AVERAGES: August 2.—Hebrons, 100s. to 120s.; Kidneys, 80s. to 110s.; Snowdrops, 90s. to 100; Scotch Regents, 90s. to 100s. per ton; foreign kinds, 4s. 6d. to 5s. 6d. per cwt.

CORN.

Averages.—Official statement of the average prices of British corn, imperial measure (quarter) for the week ending July 29, and for the corresponding period last year:—1893: Wheat, 26s. 5d.; Barley, 23s. 1d.; Oats, 21s. 7d. 1892: Wheat, 29s. 5d.; Barley, 21s. 1d.; Oats, 21s. 6d.

HAY.

Averages.—The following are the averages of the prices at the principal metropolitan markets during the past week:—Clover, prime, 135s. to 165s.; inferior, do., 110s. to 130s.; new, do., 120s. to 145s.; hay, best, 135s. to 165s.; inferior, do., 105s. to 120s.; new, mixture, 120s. to 130s.; and straw, 40s. to 60s. per load.

MARKETS.

COVENT GARDEN, August 3.

[We cannot accept any editorial responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal assemblers, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day. ED.]

MARKET settling down to a quiet business, with heavy supplies; Plums, Apples, and Filberts being exceptionally heavy, with bad trade, James Webber, Wholesale Apple Market.

The districts indicated by number in the first column are the following:—
0, Scotland, N. Principal Wheat-producing Districts—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S. Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; * Channel Islands.

BOOKS: *C. P. The Gardeners' Assistant*, by Rob. Thompson, edited by Thos. Moore, 1878 edition. Published by Blackie & Son, London, Edinburgh, &c. A new edition of this excellent work will shortly be published. The price of the older edition is 30s.

LEEKES: *H. C. & Co.* This is not a case of seeds germinating, but small bulbs have formed in place of some of the flowers. This is not at all uncommon in *Allium vineale*, the Potato Onion, &c., but we do not remember to have seen this condition in Leekes.

MICROSCOPE: *L. D.* You must be something more than a novice to be able to investigate fungous-diseases, and especially those caused by Bacteria. No book would be of much use. A regular training in a botanical laboratory is required.

NAMES OF PLANTS: *Southampton*. 1. *Philesia buxifolia* (Liliaceæ), Chile; 2. *Schizostylia coccinea* (Iridææ), South Africa.—*R. H. S.* *Dipsacus silvestris*, common Teasel.—*Ancient Norwich*. *Helianthus multiflorus*; a good double form.—*C. B.* Apple: send when fuller grown; 1, *Thuia gigantea* (Lobbi); 2, *Hypericum Androsæmum*; 3, *Thuia aurea*; 4, *Retinospora obtusa*; 5 not recognised; 6, *Cupressus Lawsoniana*.—*B. W. L.* 1, *Agrostis vulgaris*; 2, *Juncus bufonius*; 3, *Carex vulpina*; 4, *Galeopsis Tetrabit*; 5, *Stachys palustris*; 6, *Apium nodiflorum*.—*E. E. T.* *Cellomia coccinea* (Polemoniaceæ), Chile.—*C. L.* *Carlisle*. *Saccobolabium paniculatum*.—*A. B.* *Southampton*. It may be that the *Pelargonium* sent is a sport from Mrs. Pollock.—*G. L. S.* *Manchester*. Your variety of *Cyripedium bellistulum* is distinct if it remain constant.—*E. P.* 1, *Corydalis claviculata*; 2, *Carduus acanthoides*; 3, *Calamintha Acinoa*; 4, *Nasturtium palustre*; 5, *Angelica silvestris*; 6, *Geanthe crocata* (poison).

"SEED TRADE JOURNAL": *D. B.* None devoted entirely to seeds. You will from time to time find what you require in the Agricultural papers, and we occasionally devote an article to the subject.

SWEET PEA: *F. Roemer*. The flowers are of an uncommon blue tint, and the strain is worth preserving. We have observed something very near to it among Mr. Eckford's varieties of Sweet Peas. But if it is growing with others it will be difficult to obtain the variety quite true.

TECHNICAL HORTICULTURAL SOCIETIES: *A. W. McM.* We are not aware of any such having been published as yet.

VINES DYING: *R. W.* The lifting was done too late in the year, and the Vines being old, and probably destitute of small roots, failed to get hold of the soil. The operation should have been performed whilst the matured leaves remained on the Vines, say in September, then new roots would have formed in the fresh soil, and the Vines would have survived.

GARDENING APPOINTMENT.

MR. GEO. BOND, as Head Gardener to S. T. FISHER, Esq., The Grove, Tooting Bec Common, Streatham.

PARTNERSHIP WANTED, by a strong, active young man, with small capital.—Address, SARUM, 5, Ingersoll Road, Shepherd's Bush, London, W.

GEO. ABBEY, Avery Hill, Eltham, Kent wishes to THANK the MANY excellent APPLICANTS; he is NOW SUITED.

WANTED, a SINGLE-HANDED GARDENER.—No Glass at present. Willing to be generally useful. Good character indispensable. Particulars, wages, &c., to H. G. EYNON, Seedsman, Carmarthen.

WANTED, a thoroughly good experienced Man, as SECOND GARDENER of four; one who understands glass, married, without children, preferred; to live in entrance lodge.—State age, experience, and full particulars, to JAMES WOKKALL, Esq., The West Hall, High Leigh, Knutsford.

WANTED, for a Market Nursery, a practical MAN, as GROWER of Eucharis, Palms, and Ferns, &c. Preference given to one with experience of Bulb Forcing. Situation permanent to one that takes an interest in his work, and shows good results.—State age, experience, and wages expected, to TURNER BROS., Nurserymen and Florists, Garston, Liverpool.

WANTED, a young MAN, experienced in Orchids. State wages expected, those only with good personal characters need apply.—G. H., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

WANTED, a WORKING FOREMAN, age 35 to 40, no children, for small Market Garden, who thoroughly understands Mushrooms, Fruit and Vegetables. Must have held similar situation, with good character.—HARRISON, Hanger Hill Farm, Ealing.

WANTED, a practical, industrious WORKING FOREMAN, for the Fruit and Plant Houses, where five or six are kept inside. Must be trustworthy, energetic, and obliging. Good at Chrysanthemums and Carnations. Only a thorough workman will suit. Churchman. Wages, £1 per week, with good bothy, coals, light, and vegetables.—G. F. GLEN, The Gardens, Brambletye, East Grinstead.

WANTED, a FOREMAN GROWER (WORKING).—Must be thoroughly practical in the Growing for Market Grapes, Peaches, Cucumbers, Melons, Strawberries, Chrysanthemums, Bulbs, Plants, and Cut Flowers. None but a thoroughly experienced and energetic man, and who has been Grower in the Trade need apply. Good wages.—State if married, references as to ability, and character, to GROWER, Thyne & Paton, Nurserymen, Union Street, Dundee.

WANTED, a MARRIED MAN as FOREMAN, who thoroughly understands Vines, Melons, Cucumbers, Peaches, Tomatos, &c., Stove and Greenhouse Plants, Propagation, and Growing Bedding Stuff. To live in lodge, Wife to attend Gate. Characters must bear strictest investigation.—Apply, by letter containing copies of testimonials only (no originals returned), to Mr. WHEELER, Tongswood, Hawkhurst.

WANTED, an UNDER FOREMAN.—Thoroughly experienced in Mushroom Growing in Sheds and in the Open. One who is a good Grape Thinner preferred.—D. B., Calcot Gardens, near Reading.

WANTED, a MAN and his WIFE, without children, from 35 to 40 years of age. The man as STOCKMAN and General Help, and wife as Laundress. They must be sober, industrious people, and of exceptional character.—Apply, by letter, to H. NUTTING, Esq., Everleigh, East Barnet, Herts.

WANTED, AT ONCE, a practical MUSHROOM GROWER, inside and out. State age, experience, and wages required, to TURNER BROS., Garston, Liverpool.

WANTED, a MAN for General Outside Work.—To live in lodge, and take tura with Fires.—Address, with particulars, GARDENER, Carville Hall, Brentford.

WANTED, a BOY, for the Garden.—One accustomed to the work.—Apply, with full particulars, to M. ASCOUGH, The Vineries, Cross-hills, *via* Keighley.

WANTED, a NURSERY YARD CLERK, for Checking Orders, Consigning Packages, and to Assist in Office. Young man preferred. Wages about 20s. per week to commence. Permanent situation and progressive wages to a suitable man.—Address N. C., Messrs. Steel & Jones, Advertising Agents, Spring Gardens, S.W.

WANT PLACES.

TO GARDENERS AND OTHERS SEEKING SITUATIONS.

Advertisers are cautioned against having letters addressed to initials at Post-offices, as all Letters so addressed are opened by the authorities and returned to the sender.

The pressure upon our space at this season of the year is so great, we are compelled to state that advertisements received after 6 P.M. on Wednesday will, in all probability, be held over to the next week.

RICHARD SMITH AND CO. beg to announce that they are constantly receiving applications from Gardeners seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

Gardeners, Farm-Bailiffs, Foresters, &c.

DICKSONS, Royal Nurseries, Chester, are always in a position to RECOMMEND MEN of the highest respectability, and thoroughly practical at their business. All particulars on application. Telegraphic and Postal Address—"DICKSONS, CHESTER."

GARDENERS.—JOHN LAING AND SONS, having filled many important places, can recommend with every confidence energetic and practical men of tested ability and first-rate character. Noblemen, Ladies and Gentlemen in want of Head Gardeners or Gardeners for first-rate Establishments, or single-handed situations, can be suited, and have full particulars by applying to us. No fees charged. JOHN LAING AND SONS, The Nurseries, Forest Hill, and Catford, Kent.

F. SANDER AND CO. can recommend several highly qualified and energetic HEAD and UNDER GARDENERS, of excellent character, and proved ability; men thoroughly fitted for all the various duties of their profession. For all particulars, please apply to—F. SANDER AND CO., St. Albans.

GARDENER (HEAD, with two, or good SINGLE-HANDED).—Age 31, married; good reference. Near London preferred.—J., Gardener, Kingsdon, Taunton.

GARDENER (HEAD), where three or more are kept.—Age 35, married; experienced in all branches. Three years in present situation. Leaving through reducing establishment.—AUSTEN, Dunley Hill, Dorking.

GARDENER (HEAD), or GARDENER and BAILIFF.—Middle-aged, married, no family; thoroughly understands Forcing all kinds of Fruits, Flowers, and Vegetables. Highest reference from his late employer, the Right Hon. the Earl of Verulam.—W. RANDALL, 108, Kingsley Road, Maidstone.

£5 BONUS for intimation that leads to Advertiser receiving a good Indoor Foreman's appointment in private establishment. Particulars on application.—GARDENER, Mr. Francis, 10, Rosthorne Street, Altrincham.

GARDENER (HEAD), where several under are employed.—Age 47, married, no family; abstainer. Life practical experience in all branches of the profession. Also Land and Stock. Over twenty years Head in large establishments. Good characters and references for over twenty years.—J. D., Mr. H. Rosier, Ramsbury, Hungerford, Berks.

GARDENER (HEAD), where two or three are kept.—Thorough good all-round. General experience, both inside and out. Four years' good reference. Near London preferred.—Apply, stating wages, to W., Gardener, Effingham Park, Crawley Down.

GARDENER (HEAD), where two or three are kept.—Age 29, married; character will bear strict investigation. Four and a half years in present situation.—The Gardens, Distillery House, New Wandsworth, Surrey.

GARDENER (HEAD); age 32.—SIR HUGH MACDONELL has much pleasure in recommending J. H. Hall as Gardener. Seventeen years' practical experience in all branches of the profession, inside and out.—The Gardens, Ballards, Croydon.

GARDENER (HEAD).—Age 39, married; conversant with every department of Gardening. Life thorough practical experience in Fruits, Flowers, Vegetables, &c. Can be well recommended from present and previous employers.—G. NEWTON, 19, Lordship Lane, East Dulwich.

GARDENER (HEAD, or good SINGLE-HANDED).—Age 30. Sixteen years' experience in Vines, Melons, Cucumbers, Tomatos, &c. Stove and Greenhouse Plants, Flower and Kitchen Garden. Good character.—A. BOOKER, 59, Ringford Road, Wandsworth, S.W.

GARDENER (HEAD WORKING).—Age 30; late Head Gardener to H. Tunstall, Esq., Montford House, near Burnley. Thorough experience in Fruits, Flowers, Plants, Orchids, Chrysanthemums, and Kitchen and Flower Gardens; excellent reference from last and previous employers.—H. L., 41, Stock's Lane, Stalybridge, Cheshire.

GARDENER (HEAD WORKING), where four or more are kept. Fourteen years' experience in all its branches in a large establishment. Apply for particulars.—R. P., The Gardens, Bickling Hall, Aylsham, Norfolk.

GARDENER (HEAD).—Age 40; thoroughly understands the Management of large Gardens, Forcing Fruit, Flowers, and Vegetables, Kitchen and Flower Gardens, Table Decorations, &c. Highest testimonials for skill, management, &c.—GARDENER, 13, Burnt Ash Hill, Lee, S. E.

GARDENER (HEAD WORKING).—A GENTLEMAN wishes to recommend his late Gardener and Bailiff, who was with him nearly seven years. Thoroughly practical in all branches. Wife dairy if required. No family. H. HATCH, The Villas, Moorlane, Lingfield, Surrey.

GARDENER (HEAD WORKING).—Middle aged, married, no family. A thorough practical all-round man. Will be at liberty on August 21; has been used to large establishments where the surplus produce is sold. Good character. Please state full particulars to R. S., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, London, W.C.

GARDENER (HEAD WORKING).—Age 42, married, no family; not less than three under; experienced in Vines, Cucumbers, Melons, Tomatos, Stove and Greenhouse Plants, and Kitchen Garden and Pleasure Grounds. Also Flower and Vegetable Forcing. Good references.—F. PAY, Hawks Hill, Bourne End, Maidenhead, Berks.

GARDENER (HEAD WORKING).—H. WRIGHT, Gardener, Manor House, Long Eaton, Notts, is open to re-engage. Fourteen years' practical experience; four and a half years in present situation; Abstainer.

GARDENER (HEAD WORKING).—Age 27, married when suited; fourteen years' experience, thoroughly up in all its branches, Growing and Forcing Fruits, Flowers, and Vegetables; also first-class Rose-grower, and Staging for exhibition. Excellent character.—HENRY WELER, 1, Alpha Cottage, Feltham Hill Road, Ashford, Middlesex.

GARDENER (HEAD WORKING).—Age 29, married; one child. Thorough good all-round general experience both inside and out. Abstainer. Personal character.—W. SHARPE, North Cheam House, Sutton, Surrey.

GARDENER (HEAD WORKING); age 37, married.—A LADY wishes to recommend her late Gardener; a good all-round man. Seven years' character.—A. HODGKINSON, Nelson Street, Market Harborough.

GARDEN LABOURER.—Strong, hard-working, respectable young man, age 25, requires a situation as above.—E. BEAL, Gardener's Cottage, Butler's Green, Hayward's Heath, Sussex.

IN THE GARDEN OF LIFE many fragrant flowers bloom, and also many noxious weeds. The flowers are the good deeds and kind words that smooth over the rough places, and soothe the anguished heart of many a poor wayfarer on their journey through the world. The weeds are the petty and spiteful things that are sown and done by many of those engaged in the race for position and wealth. The most deadly of the noxious weeds is disease, which destroys the beautiful blossom of health. Luckily, however, there is an antidote in Holloway's Pills and Ointment, which are able to cure or relieve those suffering from disease, even in its most deadly phases.

MESSRS. LINDEN, L'HORTICULTURE INTERNATIONALE,
 Leopold Park, BRUSSELS,

Have much pleasure in offering a splendid lot of semi-established Plants of their unrivalled

CATTLEYA REX
 (LINDEN'S TRUE CATTLEYA REX).

*SOME MAGNIFICENT VARIETIES HAVE BEEN FLOWERED THIS SEASON FROM
 OUR IMPORTATIONS.*

This Cattleya surpasses in its marvellous beauty all that we know up to the present of this favourite genus,
 and must, without any doubt, rank as one of the most admirable Orchids which exists.

Also a grand stock of established and semi-established Plants, in magnificent condition, of

COCHLIODA NOTZLIANA.

This magnificent species has since its introduction become a general favourite. The beautiful forms which
 have been flowered prove that its merits were at first under-rated. The plate in the English edition of the
Lindenia, February, 1891, fails to depict the beauty of its individual flowers.

It has proved a very free plant in the Odontoglossum-house.

THE LARGEST AND BEST STOCK OF ORCHIDS IN CULTIVATION.
 PRICE ON APPLICATION.

Apply to Messrs. LINDEN'S Representative:—Mr. P. WEATHERS, Poplar Villa, Southgate, London, N.

ESTABLISHED 1832.

THE
Gardeners' Chronicle.

SATURDAY, AUGUST 12, 1893.

THE FERNS OF NEW ZEALAND.

THE most interesting fact about the Ferns of New Zealand is the large proportion which they bear to the general mass of the vegetation. Whilst in Britain there are only about forty Ferns to 1500 flowering plants, or one to thirty-seven, and in the whole of Europe only about sixty Ferns to 10,000 flowering plants, in New Zealand the number of Ferns is 130, and the number of flowering plants not much above 1000 (the exact number was 935 when Sir J. D. Hooker's *Handbook of the New Zealand Flora* was published in 1864, and there has been a considerable number discovered since), or a proportion of one to between seven and eight. Whilst in Europe the number of Filmy Ferns (Hymenophyllaceæ) is only three, in New Zealand it is over twenty. This indicates a complete difference in climate. As regards temperature, the difference between the means in the shade between the two extreme months of January and July, which in central Europe is 40° Fahr., and in Britain varies from 22° to 27°, in New Zealand sinks to 14°. But moisture has as much to do with the matter of temperature, and the absence of any period of regular prolonged dryness. In New Zealand there is always plenty of moisture; streams and rivulets abound. It is one of the best watered countries in the world. No part of it is far from the sea, the rainfall is high, and upon the hills and their slopes mists often rest. The consequence is that Ferns are very numerous, luxuriant, and beautiful, and bear such a large proportion to the general body of the vegetation.

New Zealand is 900 miles in length, so that between the south and north the climate varies greatly. The hills of the southern island rise to the level of perpetual snow. This wide range of temperature is of course indicated in its vegetation. In flowering plants subtropical types are represented by a Palm, two Peppers, three Laurels, and five epiphytic Orchids. In Ferns the same element comes out in eight Tree Ferns, a Marattia, and a Lygodium. These are three groups which do not obtain entrance anywhere into the flora of Europe, though spread round the world in the tropical and subtropical zones. On the other hand, there are in New Zealand eight out of the forty Ferns that grow in Britain, and amongst the Club-Mosses, *Lycopodium clavatum* and *Selago*; the latter does not grow at sea-level anywhere in England, and reaches to the summits of the highest mountains in Scotland.

Four common tropical and sub-tropical Ferns, *Gleichenia dichotoma*, *Nephrodium molle*, *N. unitum*, and *Nephrolepis cordifolia*, grow only in New Zealand, sparingly in the district of the hot springs.

Another very striking peculiarity of the New

Zealand flora is that so many of the plants of the colony are not found anywhere else in the world, but are what the geographical botanists call endemic types. When the *Handbook of the New Zealand Flora* was published in 1864, out of 935 flowering plants then known, 677 were endemic types—upwards of 70 per cent. Botanically the alliance of New Zealand is closest with Australia, where also a large proportion of the plants are endemic. Out of the 935 species 222 were known also in Australia, leaving only thirty-six New Zealand species known out of the colony but not known in Australia. Ferns on the average have a far wider distribution than flowering plants. *Pteris aquilina*, *Aspidium aculeatum*, *Nephrodium Filix-mas*, *Cystopteris fragilis*, are amongst the most widely distributed of all known species, whether vegetable or animal, but of the one hundred and thirty New Zealand Ferns about forty-four, or one in three, are endemic, about sixty-five are common to New Zealand and Australia, and about twenty are common to the New Zealand and other parts of world, without being known in Australia.

An excellent handbook of the New Zealand Ferns was published in 1890 by Mr. H. C. Field, who had almost lived in the forests for many years, in the pursuit of his profession as a land-surveyor, and who had enjoyed and used with great diligence and judgment his exceptional opportunities for studying the species in different situations in all their range of variation. This work is in quarto, and contains process plates of every New Zealand species, and full directions for its cultivation, and a definition of the terms used by botanists in describing the tribes, species, and genera. To this work we would refer all our readers who want to study the New Zealand Ferns thoroughly. Many of them are so variable that it is very difficult without studying them thoroughly to believe that their extremes belong to one and the same species. Here we can only pass in review the sub-orders and genera in a very cursory way.

Gleichenias.—The Gleicheniaceæ form a distinct sub-order, marked by their forked, rigid fronds, with comb-like final segments, and few large capsules, with a complete transverse ring. There are five species in New Zealand, only one of which is endemic, three extend to Australia, and one already mentioned as confined to the volcanic district, belts the world in the Tropical Zone. As this sub-order is quite unknown in Europe, these Gleichenias always strike the attention of travellers and settlers. One species, *G. clininata*, springs up in the north everywhere directly the bush is cleared, and its wide-creeping rootstock makes it difficult to eradicate.

Tree Ferns.—Of the eight New Zealand Tree Ferns, three belong to the genus *Cyathea*, one to *Hemitelia*, one to *Alsophila*, and three to *Dicksonia*. *Cyathea medullaris* is the tallest, its stem reaching a height of 60 feet. *C. dealbata*, as the name implies, has the fronds all covered over with a sort of waxy-white powder on the under-side. *Dicksonia fibrosa* is said to be the handsomest species, from the large number of deeply-divided graceful fronds which crown its caudex at one and the same time. *D. fibrosa* and *D. lanata* are so nearly allied to the well-known Australian *D. antarctica* that they were formerly classed as geographical varieties of that species. The *Dicksonias* have a mass of long woolly hairs at the base of the leaf-stalks, which is sometimes used to stuff cushions, whilst the other genera have distinct flat membranous scales. *Dicksonia* also differs from the true *Cyatheaceæ* in the capsule.

Filmy Ferns, which constitute the sub-order Hymenophyllaceæ, are found principally in the damp recesses of the forests on old trunks, amongst moss, and on rocks in the beds of the streams. They have only one layer of cells in the leaf between the upper and lower epidermis, and soon shrivel up when

exposed to the direct rays of the sun. There are twenty-three species in New Zealand, of which eleven are endemic; of these the most curious are *Trichomanes reniforme*, which has entire stalked orbicular pellucid fronds, a couple of inches broad, and *Hymenophyllum pulcherrimum*, the largest of the New Zealand species, which has deeply divided fronds a foot or more in length. Our British *Hymenophyllum tanbridgense*, first found at Tunbridge Wells, is dispersed all over the colony.

One of the most interesting of all the New Zealand Ferns is *Loxsona Cunninghami*, named after Allan Cunningham, who made extensive botanical explorations in the Northern Island in 1826 and 1828. *Loxsona* is the only Fern-genus which is peculiar to New Zealand. It has the texture of an ordinary Fern, combined with fructification like that of *Trichomanes*.

Polypodiaceæ.—We come next to the suborder Polypodiaceæ, to which the great mass of the Ferns belong. *Cystopteris fragilis*, one of the most cosmopolitan of Ferns, grows in various forms amongst the mountains. All the three species of *Davallia* are endemic. *D. Novæ-Zelandiæ* is a beautiful plant, with large finely-divided fronds, spread throughout the colony. *D. Tasmani*, confined to the Chatham Islands, where it was discovered recently by Mr. T. Cheeseman, F.L.S., Curator of the Auckland Museum, much resembles the Canarian Hare's-foot Fern (*Davallia canariensis*). Of the Maiden-hairs there are in New Zealand six species, and of the *Lindsayas* four. The finest of them is *Adiantum formosum*, which reaches a height of 4 or 5 feet, with twenty main branches, and a thousand final segments. *A. aethiopicum*, diffused all over the south temperate zone, is a near ally of the European *A. Capillus-veneris*. *Lindsaya linearis* has simple fronds, with a long row of light green fan-shaped leaflets on each side of the rachis. *Hypolepis distans* grows throughout the colony in open bush, and often springs up in abandoned clearings. The two other species of this genus are both endemic, *H. millefolium* being confined to the mountains. Of the large genera, *Cheilanthes* and *Pellæa*, there are two species each in the colony; they require less shade and less water than Ferns in general. Of *Pteris* there are six species, of which two (*scaberula* and *macilentia*) are endemic. *Pteris esculenta* is now considered a variety of our familiar English *P. aquilina*. In New Zealand it reaches a height of 12 or 14 feet. The starchy rootstocks formed an important part of the food of the Maories before the Europeans came; it still covers large tracts of land, like the Bracken in England, but was much more plentiful before regular cultivation began.

The *Lomarias* come out very strongly in New Zealand. They all have simply pinnate fronds, the fertile ones quite distinct from the barren ones, with narrower divisions, entirely covered with fructification, like the common Hard Fern (*Lomaria Spicant*) of our English moors. The *Doodias* have a similar habit, but the fronds are not dimorphic. The genus is confined to Polynesia, Australia, and New Zealand, with a single outlying representative in Ceylon.

There are about ten *Aspleniums* in New Zealand, but they are so variable in size and cutting that it is very difficult to say where one species stops and another begins. A very common and very variable species, *A. obtusatum*, is nearly allied to our English *A. marinum*. *A. bulbiferum* and *flaccidum* are larger and more deeply divided. The former is remarkable for the bulbils it bears all over the leaf, which may be taken off and planted; our common British *A. Trichomanes* is found on rocks in the southern alps of New Zealand. *A. flabellifolium* is a pretty Fern, nearly allied to *A. viride*, suitable to grow in hanging-baskets, and very easy to cultivate. *Aspidium* is represented in New Zealand by a variety of the cosmopolitan *A. aculeatum* and four other species. Of the large genus *Nephrodium* there are only six species in New Zealand, two of which are confined to the district of the hot springs, and another (*N. Thelypteris*) is a well-known British plant. Of the tropical and sub-tropical genus *Nephrolepis*

there is only one species, and that very rare. The large genus *Polypodium* is represented by ten species. *P. australe* has very small entire fronds, grows in the crevices of rocks and ascends the mountains to 5000 feet. *P. serpens* is very abundant throughout the colony, and has small, rigid, dimorphic, entire fronds. *P. Billardieri* and the newly-discovered *P. novæ-zelandiæ* more resemble the European *P. vulgare*. The two *Gymnogrammas* are small annual species of wide dispersion, very unlike the Silver Fern and Gold Fern of our greenhouses. The sub-tropical genera *Vittaria* and *Antrophyum*, so plentiful in Malaya and Polynesia, do not reach New Zealand, and the large genus *Acrostichum* is not represented.

Of the *Osmundaceæ*, the cosmopolitan *Osmunda regalis* has been found very sparingly, and may have been introduced. The common Australian and Cape *Todea barbara* is only found in the very north of the colony. Two of the most beautiful of all known Ferns, *Todea (Leptopteris) hymenophylloides* and *superba*, are widely distributed in shaded woods through both the Northern and Middle Islands. They have finely-divided oblong fronds, 2 or 3 feet long, with the texture of a filmy Fern, but with the fructification of the present sub-order.

The two tropical and sub-tropical genera, *Lygodium* and *Marattia*, are each represented in New Zealand by a single species. The *Lygodium* is a climber, and at first sight looks more like a curious Hop or *Convolvulus* than a Fern. *Marattia fraxinea* was formerly plentiful in the Northern Island, and its great tuberous rootstock formed a favourite food of the Maories, but now the wild pigs have nearly exterminated it. The same species is spread all through Polynesia, Tropical Asia, and Tropical Africa, to the Cape of Good Hope. The un-Fern-like genus *Schizæa* is represented by two species, and *Ophioglossum* and *Botrychium* by two each. Our common British Moonwort, *B. Lunaria*, is one of the last additions to the New Zealand Ferns, having been found lately in small quantity in the province of Canterbury by Mr. J. D. Eoys. *J. G. Baker*, July 16, 1893.

NEW OR NOTEWORTHY PLANTS.

DORSTENIA WALLERI, Hemsl., n. sp.*

This singular plant belongs to a genus little known outside of botanic gardens, though Philip Miller cultivated two species, or varieties of one as they are now regarded by some botanists—*D. Houstonii* and *D. contrajerva*, before 1748, and half-a-dozen species at least have been figured in the *Botanical Magazine*. The species nearest the present is *D. Mannii*, Hook. f., *Bot. Mag.*, plate 5908. Altogether about fifty species of *Dorstenia* have been described, and one only of these is a native of India; the rest being American and African, chiefly the former. Probably, however, many yet remain to be discovered in Africa, where the genus has developed greater diversity of form than in America. The great peculiarity of the genus *Dorstenia* is the inflorescence, which in the present species is both curious and beautiful, though not showy. The flowers, instead of being borne inside an almost closed receptacle, as in the fig, are crowded, male and female together, on the upper or outer surface of shield-like or cup-shaped, or sometimes even spike-like receptacle, which is often, as in the present case, furnished with appendages of some kind that may serve the purpose of attracting insects to aid in

* *Dorstenia Walleri*, Hemsl., n. sp. — Herba perennis, tuberosa, caulescens, erecta, circiter pedalis, primum plus minusve molliter pubescens demum glabrescens; caulibus simplicibus, solitariis, 4—8 lineis crassis, carnosus, infra medium squamis paucis parvis exceptis nudus; folia distincte petiolata, carnosus, ovata obovata vel ovato-oblonga, cum petiolo 2½—5 poll. longa, apice subacuta obtusa vel interdum rotundata, basi cuneata, obscure crenata, costa et venis primariis crassiusculis; receptaculum pedunculatum, pedunculo 1—2 pollicari, super sub-orbiculari, 5-gonum, circiter 1 poll. diametro, margine multidentatum et processibus subulatis sepe 5 tentacula simulantibus ½—3 poll. longis instructum; flores masculini et feminini intermixti; ovario demum stipitato exserto. *H. B. H.*

the dispersal of pollen for cross-fertilisation. At all events, the males and females of the same head do not appear to be in a functional condition at the same time.

Dorstenia Walleri is a perennial plant with a tuberous stock, from which a single unbranched, erect, somewhat fleshy stem, springs annually, rising to a height of about a foot, naked, with the exception of a few inconspicuous scales below the middle and rather crowded with leaves above the middle. The oblong, or ovate, or obovate leaves, for they vary much in shape, are also rather fleshy, and, as well as the stem, are at first more or less beset with a fine soft pubescence, and vary from $2\frac{1}{2}$ to 5 inches in length. From the axils of the leaves spring the star-fish-like inflorescences borne on stalks about 2 inches long. Each of these inflorescences consists of a circular, usually 5-angled, saucer-shaped expansion of the top of the stalk, about three-quarters to an inch in diameter, with five tentacle-like appendages radiating from the angles, and from $1\frac{1}{2}$ to 2 inches in length. But the number of angles and "tentacles" varies in the specimens examined from four to eight. The flowers are at first immersed in the substance of the saucer-shaped part of the receptacle, but as the ovaries enlarge a stalk is developed to each, so that they appear above the surface, where they find more room for expansion. Between the "tentacles," the margin of the receptacle is furnished with numerous small teeth, which, as well as the "tentacles," appear to have glandular tips; but I have not yet had time to investigate their nature. Neither have I had opportunities for observing the position of the "tentacles" at different stages of development; yet I suspect that it varies. In *D. Walleri* they are curved upwards and more or less inwards at the tips at the time of flowering. In *D. Mannii*, a native of West Tropical Africa, referred to above, the discoid part of the receptacle is convex, and the ten to fifteen slender club-shaped "tentacles" are more or less recurved—that is to say, not all to the same extent. My idea is that a collection of living *Dorstenias* would afford material for some interesting investigations. So far as the records with the dried specimens inform us, the Rev. H. Waller, one of Livingstone's companions on the Zambesi, and the editor of his "Last Journals," was the first to discover and collect this species; hence I have named it after him. The specimens were communicated by Dr. (now Sir John) Kirk in 1865. They were collected in the Manganja hills, East Africa, in latitude 15° S., and longitude 35° E. Dr. Schweinfurth collected the same species in the Nyam-Nyam country, Soudan, in 1870. There is also a specimen at Kew, without special locality, collected by Mr. J. T. Last, and presented in 1888. Lastly Mr. J. Buchanan, C.M.G., collected it at Nakatupa, in the Shiri highlands, in 1881, and later in the same region, whence he sent seeds to Kew last year. It was from a plant raised from this seed that the foregoing description was drawn up. I ought to add that Dr. Schweinfurth gave a name to this plant under the generic name *Kosaria*, but I cannot find that it was ever published, and it is not available under *Dorstenia*, having been already applied to more than one species. *Kosaria* is hardly tenable as a genus distinct from *Dorstenia*. *W. Botting Hemsley*,

LELIA TENEBROSA, WALTON GRANGE VAR., *new var.*

A beautiful and distinct form of *L. tenebrosa* now appears, which differs greatly from the very dark and richly-coloured Tring Park var., but is not less beautiful. The present variety has very large and well-formed flowers. The sepals and petals are each over 4 inches in length, the petals 1 inch wide, and the sepals and petals of a clear citron-yellow, without the least trace of the reddish hue seen in other forms of this species. The lip is white, closely striated and veined with purplish-crimson from the base, the middle area being also of bright purplish-crimson. The upper edges of the side lobes are white, and so also the tip of the labellum. Altogether it is a grand novelty. It flowered in the collection of W. J. Thompson, Esq., at Walton Grange, Stone,

Staffordshire, and in the care of that admirable grower of Orchids, Mr. W. Stevens, his gardener. *James O'Brien*.

CYRIPEDIUM BELLATULUM VAR. *LUTEO-PURPUREUM*,
n. var.

Though similar to the typical form of *C. bellatulum*, it is very distinct in the colour, character, and disposition of its dark purple markings. The entire ground colour is pale apricot-yellow, the lightest portion being the under side of the labellum, where it merges into cream-white. The sepals and petals have fewer purple markings than the ordinary form, and the blotches are irregular in shape, and often run into each other; they are also confined to the inner two-thirds of each segment nearest to the column. The exterior of the labellum is unspotted, but the interior and the infolded side lobes have purple dots. The staminode is dotted with purple, and has a dark-green-coloured centre. It has flowered two years with G. W. Law-Schofield, Esq., New Hall Hey, Rawtenstall, Manchester, who purchased it as a form of *C. Godefroyæ*, but it is certainly a *C. bellatulum* by virtue of all the slight characters by which that species was separated from the others of its group. *Jas. O'Brien*.

A TRAVELLER'S NOTES.

(Continued from p. 133.)

III-EI-ZAN.—The side I ascended was well clothed with vegetation, the magnificent groves of *Cryptomerias* all along the sides and ravines being most striking; Violets and *Epimedium* were freely flowering. The species of the latter I believe to be *macranthum*, though without any books or material for comparison it is difficult to be certain, and but little reliance can be placed on the native names, as one plant may have several names, and not infrequently one name does duty for more than one plant. The under-growth is largely composed of the low-growing "Manas Bamboos," so common in Central Japan, intermixed with which, at the base of the mountain were many of the common brick-red Azalea.

The summit of the mountain was bare, with the exception of low Bamboo, a state of things which continued for about the first thousand feet of the descent, a most abrupt and curious change from the side facing the lake.

The view from the summit was magnificent. On one side the lake, its shores, with the chains of low hills beyond; on the other, a panorama of the great ancient town of Kyoto, spread out in a fertile plain.

I arrived here (Kyoto) last night, since when it has rained with solid determination and with a consistency which forces admiration. There is no mistake when it rains in Japan, but when it ceases, it does cease, and the sun frizzles you up half-an-hour afterwards and continues to do so, until it again begins to rain.

The garden in Kyoto known as the Old Imperial Garden, which the Mikado used during the Shogun's power, is an interesting old place, but no longer carefully kept up.

It is not large, the main portion being occupied by a lake, so narrowed in the centre that a small stone bridge crosses it. In shape it is not altogether unlike an irregular figure eight. In the centre of one portion a small island on which are many young Maples, is connected with the shores by two quaint stone bridges, each beneath a thick arbour of *Wistaria*, now flowering, its long racemes and still longer shoots trailing over the sides and parapets of the bridges, reaching almost to the water.

The *Wistaria* is flat-trained on a Bamboo roof. I have seen many such specimens, that at Kameido near Tokio is probably the finest. It is impossible to convey an idea of the beauty of this plant thus grown, the many dozen spotless clear-blue racemes hanging down through the Bamboo support produce a charming effect, totally different to what it does in England. [See fig. 33 in the *Gardeners' Chronicle*, February 25, 1893.]

Round this lake, on undulating ground, are some fine specimens of trees, often overhanging and reaching to the water's edge. They are evidently of considerable age; *Ilex latifolia*, some 50 feet high is larger than I have ever seen it, and was flowering freely. Judging by the size of the specimens usually met with, I conclude this plant is of slow growth. Pines and Oaks were also fine, both have fine stems. *Photinia serrulata*, a common plant, and one much

used for hedges everywhere I have been, was also well represented, as was *Podocarpus* and *Salisburia* (*Ginkgo*), the young green leaves of which are just now very pretty. *Camellia japonica*, *Eriobotryas*, *Ilex integra*, Cherries, and some lovely flowering bushes of double *Kerria*, were all to be seen on the lake shores.

The finest specimens in the garden were those of a deciduous tree, I believe it to be *Aphananthe aspera* of the *Ulmaceæ*. My guide examined the people in the garden about it, and elicited this satisfactory information: "It bears fruit after summer." I suggested this was not unknown, when the equally surprising statement, "It fruits before the winter," was made, with such a touching politeness and an air of such profound conviction, that I really had to give it up. It is a tree of the noblest proportions in every way, though the individual foliage is small.

From a bridge (known as the bridge communicating with heaven) in a Monastery of the Zeu sect, one looks down upon a lovely gully, famous for its Maples. I went to see this—a really pretty spot. Round these temples, as well as growing wild on the hill-sides, the Maples and Oaks are now generally pretty, also *Diospyros Kaki*, *Photinia glabra*, Cherries, *Elaeagnus*, and *Wistaria*; whilst of flowering plants in bloom, I have recently noticed *Viburnum plicatum* (very good), China Roses (most free), *Cercis siliquastrum*, *Caragana arborecens*, and *Thermopsis fabacea*. Tree *Pæonies* are coming on; those which have received a certain amount of protection, such as a slight awning, being now in flower. I certainly notice nothing I have not previously seen—a fact scarcely to be wondered at, I suppose.

The gardens of the Monasteries *Kinkakiyi*, *Ginkakiyi*, and *Nishi Honwanji* are fine; the latter is the largest monastery and temple in Japan, as well as being one of the wealthiest. Its paintings are famous; some rooms contain paintings of only geese, others of peacocks, whilst one of the most striking has its sliding screens decorated with Bamboo and sparrows. The largest of all has a pine, stretching from one screen to the other, carried along the whole of one side—it is wonderfully done, even the grey scabs on the bark being reproduced. Perhaps the most interesting of the three gardens is that adjoining the first; though I must not forget to mention that in front of the large and magnificent temple *Nishi Honwanji* is an "Icho" (*Salisburia*), credited with the power of extinguishing fire, and said to be the largest in Japan; it certainly is not the highest, not reaching 50 feet, but its spread of branches is very great.

The Chinese garden behind the *Kinkakiyi* Monastery is from 400 to 500 years old, and most prettily situated. It contains a lake, in which are some huge carp and red-fish, a golden pavilion, and a curious pine in the form of a junk. I was asked to guess the age of this tree, and put it at 200 years, but a priest said it was over 300. The main trunk forms a mast, two leading branches, leaving the main stem in a line, forming the hull, about 35 feet long; the tree is scarcely as high. All the remaining branches up the main stem have been pruned off foliage for about 1 foot from the trunk, and what is left at the end being trained in circular form. For so many years has this been done, that the present foliage and young shoots rest on quite a thickly interlaced network of old wood.

The garden and the islands on the lake are chiefly planted with Pines, Acers, and Azaleas, in excellent taste. In the courtyard before the monastery is a fine specimen of an evergreen Oak; the priests call it "Ichii"—*Quercus Gilva*. The stem is 4 feet in diameter, straight and even, the head round and symmetrical, the whole reaching some 45 feet.

About 10 miles due south from Kyoto is the village of Uji, surrounded by Tea plantations, long famous as producing the finest Tea in Japan. The Tea-plant is cultivated in a way different to what I have seen elsewhere. Only in one instance did I notice separate plants; in nearly all the fields, the plants in the rows, ranging from $2\frac{1}{2}$ to $4\frac{1}{2}$ feet high, were so old and so intergrown, that each row was a thick hedge several feet through. Picking commences the second week in May, after which the Tea is cleaned over by girls in the peasants' houses, and then subsequently rolled between coolies' hands. There are, of course, no great drying or cleaning establishments; each peasant's house works independently in a small way. Many fields were entirely covered by straw-mats, on a low scaffolding of poles. If looked at from above, such as a high part of the road, one looked down on several acres of mats. I judge this was done owing to the plants having reached a picking stage; but it being impossible to

go over all the fields at once, the owners desired to retard the further growth of the young shoots. Rain and sun were excluded, and, as far as possible, all light, for even from the roof of mats a row hung down all round each field, the tops of the plants being hidden from view. One of the choicest kinds is the Gyokuro (Jewelled Dew), varying in price from 5 to 7½ dols., equal to 14s. 3d. and 21s. 3d. The Uji plantations are said to date from the end of the 12th century, though it is believed Tea was introduced to Japan from China by a Buddhist Abbot—Dengyō Daishi—as far back as the year 805. *James H. Veitch.*

(To be continued.)

ORCHARD TREES AND THE PRUNING OF ROOTS.

FROM the correspondence on this subject which has recently appeared in the *Gardeners' Chronicle*, anyone unacquainted with the subject and the notions of gardeners concerning it would still be in the dark as to what the various writers mean. He would first ask, Why do the gardeners want to cut off the roots of the trees that are to bear the weight of a crop of fruit, a heavy crown of leaves and branches, and withal keep in an erect position? It would also suppose that it would be bad practice to follow in any but the most sheltered gardens, for the wind would surely overturn any tree when denuded of its anchors. Then, again, he would remember that the old orchard trees—the moss-grown, gnarled old fellows—Apples or Pears, down in the west and south, numbering may be from 80 to 100 years, were never root-pruned at all, and yet these in their prime bore heavy crops of cider, dessert, or kitchen fruit. These old orchard trees, worn out by years of bearing, are the hogsies wherewith the men of root-pruning proclivities scare the young men, and even urge old hands who should know better, out of their well-tryed courses. The root-pruning enthusiasts say, "See what the neglect of root-pruning, of surface-feeding, of mulching has done," and the rank and file are inclined to believe them.

Some writers seem to labour under a confusion of ideas, as when they write of root-pruning, it is the garden bush, pyramid, half-standard, or espalier on dwarfing stocks that is meant. These must be checked in growth, or they would soon grow out of bounds or not fruit at an early part of their existence; and nothing does this so well as transplanting and a small amount of simultaneous root-pruning, if the latter should seem to be desirable. But who with any proper conception of the cost would enter on the operation of root-pruning an orchard, say, of several acres, with trees standing, say, at 30 feet apart, *i.e.*, 48 trees per imperial acre? The thing is ridiculous, and the sooner our writers recognize that it is so the better.

Mr. P. Crowley's story of his orchard (garden?) trees with roots cut in to a square of 4 feet, or a circle with a diameter of 4 feet, heats the lot. If a gardener wished to remove his trees with balls of earth (also unnecessary) of small compass, he would set about it in Mr. Crowley's manner. He would dig out a trench, say 1 foot wide, round the trees, as deep as the roots descended, cutting a straight wall of soil on either hand, severing every root that reached further than 4 feet, throwing out all the soil to the very bottom. The trench would then be filled up with leaf-mould, garden refuse that had been charred, and some of the staple soil, the whole being well mixed together and trodden firmly as layer by layer it was thrown into the trench. This work would be performed in the autumn, and by the following autumn the tree would be fit for removal, with myriads of small roots thrust out into the fresh soil in the trench. This new soil would mostly fall away, but the roots would remain ready to seize upon the fresh materials in its new station. Again, provided that an orchard of Apples, Plums, Pears, Cherries, Walnut La Vertilla, Quinces, Medlars of whatever varieties, worked or unworked, as would be the case most likely with the last two, is properly planted on a suitable site, but little is

needed beyond the proper formation of the head at the first by judicious pruning, and subsequently the keeping the same clear of weakly shoots, with an occasional shortening back of the leading branches to fill out the increasing circumference of the crown. The roots may in some measure be kept at the surface by surface mulches, but the main roots will and should descend, therefore the more need of a deep soil and deep trenching or stirring of the same. The use of the dwarfing-stock premises three things—root-pruning and triennial transplantation, and summer pruning. But this is garden work, not orchard; *petite culture*, not wholesale culture; the aims and methods differing accordingly. Some of the writers in the *Gardeners' Chronicle* have been thinking of orchard trees, but writing of the trees and bushes of the garden. Notable exceptions are "Extensio" and "E. M.," who seem to have got the right grip of the subject. A.

COLONIAL NOTES.

BOTANICAL STATIONS.

(Continued from p. 152.)

ANTIGUA.

THE "low flat island" is found to be well diversified into mountain, hill, and plain, with beautiful and extensive views in all directions.

The rainfall on the island is, however, small, and the vegetation is not of that luxuriant character which is frequently associated with tropical islands. Great parts of the surface are covered by the thorny scrub so characteristic of the Antillean geographical region. This is made up of different kinds of Acacia, with *Furcraea* and *Agaves* at intervals, and, in some parts, several forms of Cactus, and quantities of the wild Balsam (*Cascarilla balsamifera*). Along the coast are fringes of the bright green *Mauchneel* (*Hippomane mancinella*), and the lagoons and swamps are crowded with various *Artemisias* and *Mangroves*. The *Tamarind* (*Tamarindus indica*), and *Lob-lolly* (*Pisonia subcordata*), *Turkey-berry* (*Cordia collococca*), and *White Cedar* (*Tecoma leucoxyloides*). *Turpentine tree* (*Bursera gummifera*) and *Sand-box* (*Hura crepitans*) appear to be perfectly at home; while the *Mahogany* (*Swietenia mahagoni*) and *Logwood* (*Hæmatoxylon campechianum*) are of slower growth, and more or less stunted. There are few Palms, but the ordinary *Cabbage Palm* (*Oreodoxa regia*) appears to be well adapted to most parts of the island. A *Fan-Palm* (*Sabal Blackburiana*) grows well in certain parts, particularly around Parham; while the *African Oil-Palm* (*Elaeis guineensis*) is established in the neighbourhood of Wallens and Body Ponds.

As long as sugar is the staple product of the island, it is not probable that tree-planting will be taken up to any extent, since it appears to be accepted that trees are inadmissible in or near cane-fields.

The main line of action of the Botanic Department has been to discover what plants are best suited to the dry marl region—especially in the direction of folders, fibres, vegetables—to decide what more luxuriant forms may be safely grown in the more sheltered hill and valley region of the south-west; and finally, to improve the fruit-market of the eruptive tract generally, and to introduce other economic plants specially suited to this region.

The principal botanic station on Skerritt's Estate, in the drier part of the island, has been supplemented by one at Body Ponds, and another at Copse Cross, near English Harbour. The Body Ponds plot lies at the north-east margin of the eruptive region, and represents from its water supply and general position the sheltered valleys suited for Cacao and Nutmegs; while that at Copse Cross is a sample of the Pine-apple region of the south. Stations will be considered in greater detail further on.

The Botanic Station at Skerritt's is situated about a mile to the east of St. John's. The site selected was fixed upon because it is the only spot upon the estate which has the advantage of even a moderate supply of water.

The soil is heavy, but it is good and deep. Without doubt, a sufficient quantity of work in tilling, the continued application of manure, and a suitable system of irrigation, would bring the soil into fine condition, and render it capable of growing almost anything. But the site is much swept by the wind. The construction of a shelter-belt is of the utmost importance. The wind, coming direct from the sea, about 3 miles away, sweeps along the dry hill-sides clothed in scrub, and makes it exceedingly difficult to grow anything in the open.

Great quantities of drought-loving fibre plants, such as the *Mauritius Hemp* (*Furcraea gigantea*), the *Snake Grass* (*Sansevieria lanuginosa*), *S. guineensis*, *Sisal Hemp* (*Agave rigida* var. *sisalana*), have been grown and planted out. At the other extreme, *Grapes*, *Figs*, *Mangoes*, *Bananas*, *Oranges*, have been steadily and successfully propagated; and in spite of the peculiarly unsuitable conditions, the grafting of *Mangoes* has been distinctly successful. The supply of manure has been a source of anxiety ever since the founding of the station, because a good mechanical manure is perhaps more needed than anything else for getting the land into good heart. The soil is good, but heavy.

The necessity for carrying all the water by hand is a serious drawback. This has rendered it, so far, impossible to make the shelter-belt grow rapidly. The shelter-belt consists of *Mangoes*, *Almonds*, *Mulberries*, *Red Cedars*, *Eucalyptus*—all of which are growing, although slowly.

A great deal of work has been done in connection with fibre. The progress of the various plants has been very satisfactory, propagation has been extensively carried on, large quantities have been distributed, and a large stock is in hand for future demands.

The plants in the trial plot of *Furcraea cubensis* (recently determined to be really *F. gigantea* var. *Willemetiana*) have grown rapidly. The plot was sixteen months old in December, 1891, and the height of the plants was 4 feet. This growth was unexpected, and would suggest an earlier crop than usual; but it is not yet possible to determine whether the growth is not too rapid for the formation of good fibre. Seventy-one thousand and three hundred plants have been sent to Anguilla, for the establishment of a trial fibre-plantation there. The fibre of *Sansevieria lanuginosa* (*Snake Grass*) has a great future before it.

(To be continued.)

MORMODES PARDINUM VAR. UNICOLOR.

OUR illustration (fig. 34, p. 181) gives a representation of the yellow unspotted form of *Mormodes pardinum*, illustrated in the *Botanical Magazine*, 67, t. 3879, but which is commonly known in gardens as *Mormodes citrinum*, the typical spotted form being illustrated in the *Botanical Magazine*, 68, t. 3900. The self-coloured form has been rare in gardens, until a recent importation by Messrs. F. Sander & Co. proved very prolific in this variety.

Most of the species of *Mormodes* exhibit great varieties in colour, perhaps the most variable being *M. buccinator*, which varies from nearly white up to chocolate coloured, the various forms being either spotted or unspotted.

Mormodes and the other genera usually associated with them, *viz.*, *Catasetum*, *Cynoches*, &c., have of late received more attention in gardens than formerly; perhaps because their culture is now better understood. They are easy to cultivate if it is observed to give them a rest in a tolerably cool dry house after the leaves by their withering, together with the mature appearance of the last-made growth, have indicated that the season of rest during which they are to be kept cooler and quite dry, has arrived.

NURSERY NOTES.

MESSRS. SUTTON AND SONS, READING.

To such an establishment as the above a visit is interesting, at whatever time of the year it may be made, and at this season the especial attraction is the florists' flowers in the trial and seed-grounds and glass-houses. We cannot speak too highly of the excellence of the strain of *Gloxinias*, which are plants of splendid habit, faithfully responsive to the special skill that is lavished upon them. It was these, together with *Begonias* and *Achimenes*—of which more hereafter—that were the objects of our particular notice.

If we mention *Gloxinias* first, it is because of the reputation that Messrs. Sutton have already gained by such first-class seedlings as Her Majesty and some others. Perhaps the most important points in a good and useful *Gloxinia* are these—large handsome flowers, with flat open mouths, much substance in bloom to ensure good lasting capacity, self-supporting stems, a floriferous habit, strong constitution, and as pretty and good-habited foliage as can be secured. In the case of coloured varieties, delicate markings, and attractive and pleasing colour. The collection under notice possesses many of these properties to a large extent, some of the seedlings rapidly approaching an ideal *Gloxinia*. There are the pure whites, the spotted types, the feathered flowers, the pencilled and the tigered kinds; all are well represented by seedlings which show considerable advance even upon those of recent date. Any description of the splendid white, Her Majesty, is now uncalled for, it being very generally known, but we may add concerning it that it is still distinct and desirable, and will be so for some time yet. How-

ever, this variety with such substance in the flower was crossed with one of the French type, and the offspring is now in bloom. Perhaps it would not be fair to Her Majesty to say that the one in question is superior, but to our own taste we admit that the seedling is preferable. It is a milky-white, a prettier,

this flower might easily have been less expressive; it was this—"White Princess May, with a beauty spot of rose upon her cheek." The variety that bears the name of the Duke of York is a typical florists' flower; its throat is of scarlet, and has a pretty white margin. Empress of India is a handsome

rous varieties, mostly seedlings, of six months old, and blooming in profusion. The strain is an excellent one, and every endeavour is made to still further improve it. The trade in these Begonias is chiefly in the seeds, which are sold in packets. The catalogue of the finest varieties raised from cuttings

FIG. 34.—MORMODES PARDINUM, SUB VAR. CITRINUM: FLOWERS YELLOW. (SEE P. 180)

flatter bloom, and larger. These characteristics, of course, are such as we might expect from the cross, and if a little of Her Majesty's substance has been lost, it is but little, and this in subsequent crossings will most likely be restored. Princess May many will remember seeing at the Temple Show; it is a lovely flower, white, with rose spot upon the petals. A description we heard applied to

flower of dark violet-purple, and of first-rate substance. Another one, and which is said to be a "hark-back" from a pure white, is a very fine blue flower, has a large throat, and splendid margin; its habit is good. The collection of these fine showy flowers, in perfect condition, and blooming profuely, and in great variety, is alone well worth a visit.

Begonias.—Several houses are filled with tube-

is specially limited in extent; consequently, whilst we can give credit for excellence in the stock, it will not be necessary to specially describe particular varieties. The many different forms that this flower assumes, in its remarkable mimicry of other flowers, are all found here; and every colour and tint at present observed in Begonias may be obtained. Our attention was attracted by groups of a variety called

Prince of Orange, and another, Queen of Whites, which had been raised from seed, because of the faithfulness the seedlings bore to the type.

Messrs. Sutton have paid very considerable attention to the semperflorens groups of the fibrous-rooted Begonias, and have raised a family of winter-flowering varieties that are already enjoying a wide reputation. We have in previous notices referred to the history of these gems, and must therefore confine ourselves on the present occasion to merely a mention of the names and desirable characteristics of these plants, for winter furnishing specially, and in some cases for bedding in the summer. Soowflake is pure white, surprisingly floriferous, and of excellent habit; it was sent out some few years ago. Duchesse of Edinburgh is a charming plant; its flowers are white, suffused with pink or rose, exceedingly chaste looking, and delicate in tint. Duchesse of York is all rose, a pretty companion to the others. Coral Gem is one that justifies its descriptive name. The last we shall mention is Crimson Gem, and perhaps it is difficult to say in which capacity it most excels—in its adaptability for winter decoration, or its remarkably handsome qualities as a summer bedder. For both purposes it will give real satisfaction, and when bedded, the foliage assumes nearly the same colour as the flowers, compact and even in growth—it will always command attention.

Achimenes.—With the large flowers of pretty colours that have now been raised, these are worthy of much more extended cultivation than they have. They do not require the heat that is necessary to grow the Gloxinias to perfection; a cool structure, from which the frost can be excluded during winter being all the protection that is essential. Many gardeners start their plants in too much heat, and they are unable afterwards to stand any appreciable change of temperature.

Amongst the older varieties of the longiflora type Margaretta is a very fine one, having a large tube of good substance, and pretty paper-white in colour. Celestial is a pale mauve flower, very delicate. Alha maxima, or the real white longiflora, is large and pure; then there is longiflora major, a blue one, that at one time was considered a decided advance upon the old mauve, and a new seedling, shown at Chiswick show this season. The colour of this seedling is blue, but—and especially as the flowers open—a darker shade than the variety l. major, and the under sides of the leaves, which in the major are green, are tinged much with red. In the group of Gloxiniaeflora or Chirita type, the now comparatively well-known Rosy Queen is by far the greatest success achieved. To any who may not have seen it, it would be a revelation; its large flowers much resemble the Gloxinia, and they are of such lovely rose it is unique and beautiful. The coccineaeflora type is best represented by Dazzle, a very fine bright flower with flat broad petals, and extremely floriferous habit. Other and older varieties that are yet desirable must include Ambrose Verschaffelt, Lady Lytton (rosy-cerise), Dr. Hopff, and some others.

The Trial Grounds.—These extensive grounds, covering some 60 or 70 acres, and entirely devoted to the purpose of testing new varieties of flowers and vegetables, fully demonstrate the great efforts made by the firm to ascertain the exact character and worth of anything new, before it is taken up and recommended to the public. As an instance of the magnitude of the work and the mass of detail there must be to look after, it is sufficient to state that during the present season there are 597 kinds of Peas being tested side by side, 210 of which are seedlings. The annuals and plants generally here tell the same tale as most other places, of long unsatisfied thirst during the time the plants should have been making their growth. However, it is interesting when so many plants are side by side to notice the very different degrees in which some of the plants have been able to resist these unfavourable weather conditions, as affording some indication of what are the best subjects for a hot, dry position—and the worst. Clarkias, for instance, were nearly a com-

plete failure; and Poppies were bad and blighted, if we except the Shirley varieties, which were blooming freely, and had covered the beds. Eschscholtzias in several varieties, on the other hand, were looking extremely well, and contributed the gayest picture to be seen here. Calendula Orange King was very showy; and large beds of Alyssum miniatum were pretty and attractive. One of the best plants for a season such as the present has been is, no doubt, the Portulaca, and the colours are so brilliant and varied in the double and single varieties, we shall not readily forget what a splendid sight they were on a warm border in the nursery grounds. The seed should not be sown upon dry ground.

Petunias, always done well here, had not suffered so much as many plants, and were looking fairly healthy, and blooming profusely. All the different forms and colours, single and double, are included in the collection.

HEATING PLANT-HOUSES.

BEING about to erect a new range of plant-houses, I have been, like many others, troubled about the selection of the best method of securing equal heating without the pipes being a nuisance. As my previous experience has led me to doubt the laws laid down by the so-called "practical man," and with the object of obtaining some reliable data, I have made a series of careful experiments which give results well worthy of serious consideration. To prevent doubt as to correctness, the six thermometers used were all tested and verified by a Kew standard instrument, and their positions were exchanged twice during each experiment.

The first house tested is one 21 feet by 19 feet by 16 feet to ridge; S.W. aspect, built against two walls at right angles to each other. The heating arrangement is a close tank 9 feet by 4 feet by 3 feet, sunk below the wall at one end, no pipes being used; the tank at its nearest point is 3 feet away from the outside wall, and the greatest distance between the tank and lowest part of the glass is 15 feet. The tests were made in a driving snowstorm, and again in a calm frost.

During the snow-storm one thermometer behaved in an erratic manner, varying fully $1\frac{1}{2}^{\circ}$ F. without apparent reason; but I found the cause was a leakage of cold air through an imperfectly-closed casement. This was prevented, and the tests were again repeated.

POSITION OF THERMOMETERS.

1.— 4 in. from glass, 15 ft. from tank, 3 ft. from floor.	
2.— $2\frac{1}{2}$ in. .. 4 ft. .. 2 ft. ..	
3.— 3 in. .. 5 ft. .. 6 ft. ..	
4.— 12 in. .. 4 ft. .. 5 ft. ..	
5.— 8 ft. .. $1\frac{1}{2}$ ft. .. 2 ft. ..	
6.— Outside temperature, 31° .	

The temperature registered by No. 1 was 49° ; No. 2, 49° ; No. 3, 50° ; No. 4, 49° ; No. 5, 50° .

It is abundantly evident from the above that the theory of equal distribution of pipes to insure equal heat is a mistake, and that the heat will equalise itself without any assistance. To verify this in an independent way, I repeated the experiments in my cucumber-house, which is a lean-to surrounded with pipes, the front ones near the glass, and with pipes under the beds on both sides. The heating of this house is supposed to be perfection, having been carried out at a considerable expense in the newest and most approved manner, and I was very much surprised to find a difference of $8\frac{1}{2}^{\circ}$ between a thermometer 3 inches from the glass and one in the centre of the house, the readings being:—

3 inches from glass at side	$60\frac{1}{2}^{\circ}$
Centre of house	69°
5 inches from inner wall	65°
Outside	31°

For the sake of precision, it may be stated that in the tank-experiments all the measurements are horizontal distances taken at the floor level; the extra distances caused by differences in vertical level were not taken into account, there being no appreciable difference in readings at different vertical levels. It would appear that the best system of heating is not the one with cumbrous pipes, which are

such an eyesore and a nuisance in most houses, and that far better results can be obtained by close tanks placed anywhere out of the way, and I shall adopt this method, to the exclusion of pipes as far as possible, in the five houses I intend to erect.

HOW TO TEST THERMOMETERS.

Some of your readers may like to repeat the experiments, but object to the expense of half-a-dozen standard verified thermometers, but it is an easy matter to obtain the corrections for any number of common thermometers in the two parts of the scale necessary for the tests. Obtain a wide-mouthed jug holding 1 to 2 quarts, wrap it round with a towel or flannel, and half fill it with a mixture of snow or ice and water; place all the thermometers in this, and allow them to stand 15 or 20 minutes. The difference between 32° and the reading will give the error of each thermometer at freezing-point. When this is done, half fill the jug with water, very slightly warmed, and replace the thermometer, allowing the whole to stand until the temperature falls to the required point, and again take the readings for the error. Of course, in this test all the thermometers may be incorrect; but this is of no importance, as the difference only of the temperatures in different parts of the house requires to be found. The absolute temperature is not required to detect irregularity in different parts of the same house. The testing of each thermometer is necessary, as it is no unusual thing for even expensive thermometers to vary from 3° to 5° from the true temperature in different parts of the scale. *Thos. Fletcher, Grappenhall, Warrington.*

SWEET PEAS.

MR. HENRY ECKFORD is unwearied in his endeavours to augment our list of varieties of Sweet Peas, and in doing so he has placed in the hands of lovers of flowers a mass of beauty with which to beautify the garden, as well as ample material from which to cut; and it is interesting to note that while Mr. Eckford, by means of intelligent cross-fertilisation, has given us colours and combinations of colours undreamt of in Sweet Peas a quarter of a century ago, the exquisite perfume of this old favourite remains the same, and its habit of growth is not in the least degree changed. With new colours have come also increased size and substance in the blossoms, which is the natural development of most flowers when they are taken in hand and improved.

Until Mr. Eckford commenced the process of cross-fertilisation with Sweet Peas, any new introduction had been apparently the result of sports, or, as in the case of the Inviocible Scarlet selection, Mr. Thomas Laxton has helped in the work; but to Mr. Eckford is mainly due the production of new and distinct varieties. As a matter of course, when new forms are produced in quick succession, there is always the danger of sameness, and though some varieties have been sent out which appear at first sight nearly to resemble each other, yet on a close inspection they are found to be really distinct. The latest novelties shown by Mr. Eckford seem to point to decided improvements in our striped varieties, while some are densely spotted or punctured, and such are welcome novelties. But in all the new introductions there are some that do not find the marked favour that others do; at the same time it should be noted that all are more or less admired, and that what one deems weak another considers to be beautiful, and so all are admired.

Ten new varieties were shown by Mr. Eckford at the last meeting of the Royal Horticultural Society, viz., Eliza Eckford, the standards a pretty hue of rose, the back of the standard having a vertical bar of deep rose, the wings delicately striped with rosy-pink—a very pleasing and attractive variety (Award of Merit); The Belle, the pale standards and wings heavily flaked with rose—a very distinct and charming variety (Award of Merit); Blanche Burpee, standards and wings creamy-white, flowers large and stout in texture; Countess of Aberdeen, white,

delicately tinted towards the edge of the standards with the softest pink, the wings blush—a very pretty variety; Excelsior, the standard shaded orange-red, the wings magenta-red, rich and bright in colour, large and stout; Lottie Eckford, the reverse of the standards deep mauve, paler on the surface, the wings white headed with soft mauve; Meteor, standards bright deep orange-salmon, the wings delicate pink, with slight veins of purple; Mrs. Chamberlain, white striped, and heavily flaked with bright rose—very striking and pretty; Novelty, orange-rose standards, the wings delicate mauve, and lightly margined with rose—very bright; and Princess May, white, striped and flaked with delicate pinkish-purple.

Of varieties recently distributed, Mr. Eckford had the following in bold bunches:—Venus, salmon-buff, and rosy-pink, very distinct; Emily Eckford, cerulean-blue, and reddish-mauve, one of the very best of the blue Sweet Peas—extra line; Gaiety, a very pretty striped variety, white, striped and flaked with bright rosy-lilac, the wings delicate blush—very distinct; Fire-fly, intense crimson, a fine self flower; Duke of Clarence, also a self, colour rosy-carmine, the wings shaded with violet; and Blushing Beauty, soft pink, suffused with lilac, a charming variety.

Of older types, the following are very attractive:—Mrs. Eckford, primrose; Dorothy Tennant, puce-violet, very fine; Lemon Queen, delicate blush-pink and lemon; Senator, striped, and flaked with violet, very fine; Captain of the Blues, bright purple-blue, very fine; and Princess Victoria, dark cerise, and mauve-pink, very pretty.

We do not employ the Sweet Pea sufficiently for autumn sowing, either for blooming under glass, or for planting out in the open, to flower long before the spring-sown plants can do so. By sowing Sweet Peas in pots at the beginning of September, having at most three plants in a 5-inch pot, and keeping them in a cold frame all the winter, they can be had in bloom quite early in the year under glass, when they are found most useful to cut from. By sowing in autumn in the same way, and wintering in a cold frame, and the plants put out in the open as soon as it is safe to do so, and planted in rich soil, each one being allowed ample room, the Sweet Pea will grow to a large size, and bloom much more freely and finely than those raised from plants the seeds of which are sown in the open in spring. It is only when Sweet Peas are grown as single plants in good soil that anyone can be made to see how amply they branch, and what bushes they become. R. D.

COLEUS TUBEROSUS.

Our figure is taken from a tuber presented to the Chiswick Garden of the Royal Horticultural Society, by the Director of the Royal Gardens, Kew. Its general appearance is sufficiently well indicated by the figure. The colour is a dull red, like, but not so deep as that of Beet. According to the *Potager d'un Curieux*, the tubers were introduced into France from the Transvaal under the name of Matambala in 1884, with the information that the tubers were cultivated and utilised in the same manner as Potatoes. The plant seems readily propagated, either by tubers or by cuttings, but it requires too much heat to be profitably cultivated in our climate. It seems likely, however, to prove a very valuable introduction to our tropical and subtropical colonies. M. Pierre, to whom tubers were sent from the Jardin des Plantes, by Max. Cornu, has employed it in this way with great success at Libreville, Gaboon. The plant grows with great vigour in the rainy season; in the dry season June to October it grows, but requires water to enable it to produce its tubers. It is during this period that it produces its flowers. The crop is dug in December and January. An allied plant, of which little is known in gardens, is the *Plectranthus madagascariensis*, a tuberous Labiate, cultivated in the Mauritius, in Madagascar, and the eastern coast of Africa.

BEDDING IN HYDE PARK.

It is pleasant to observe a welcome change from the formal type of bedding-out formerly in vogue in this park, and to see the plants disposed in a more diversified and bolder manner. The introduction of larger numbers of fine-foliaged plants, as Palms, Grevilleas, Bamboos, Eucalyptus, Erythras, Cannas, in bold groups, diversified by flowering plants, is a change in the right direction which Mr. Browne, the park superintendent, has brought about.

Particularly striking just now in a series of beds commencing at Stanhope Gate is one the centre block of which is composed of Carnation Alice Ayres, carpeted with *Lysimachia nummularia aurea*, and edged with *Viola lilacina*—a happy combination; very good also is a bed of the salmon-coloured *Pelargonium Omphale*, carpeted with *Viola lilacina*, outside that a band of *Iresine Lindeni*; finally, an edge of a white flowering *Lobelia erinus*. A very rich bed is one having as the centre the popular Henry Jacoby *Pelargonium*, carpeted with *Viola Mrs. Turner*, banded with *V. lilacina*, and edged with *Lysimachia nummularia aurea*. White-flowering *Pelargonium Aspasia*, carpeted with *Viola lilacina*,

FIG. 35.—TUBEROUS COLEUS. (Real Size.)

having a band of *Pelargonium Creed's Seedling*, and edged with *Lobelia Crystal Palace compacta*, forms a good bed. On either side of the South Street Gate entrance to the park, is a group of *Pelargoniums*, one crimson, the other salmon, plunged in the grass, and which have a good appearance.

The next run of beds from South Street Gate is planted with taller growing plants, two being planted with light Fuchsias, Mrs. Marshall and Lustre Improved, with *Lilium lancifolium* between, and carpeted with *Viola Beauty of Chipping Norton*, having a band of silver *Pelargonium*, and an edge of *Viola lilacina*. Two other good beds are planted with Ivy *Pelargonium Madame Crousse* and Galilee, both being carpeted with a mixture of *Violas*, and bordered with white *Lobelia*. The centre bed in the series is planted with quite a new thing for bedding purposes, to wit, *Maurandya Barclayana*, which is trained up sticks, in the shape of a pyramid, with its pretty purple flowers intermixed with the old *Calceolaria amplexicanlis* trained in the same way; the effect produced by this combination is a pleasing and happy one.

At the rear of these beds there are groups of Palms, Eucalyptus, Heliotropes, and *Plumbago capensis*, giving a bold and effective finish to the

whole. Next is a large group of crimson *Pelargoniums*, which look rich, plunged in the green grass.

Continuing on the east side of the walk there is another run of beds. Very pleasing is a small circular bed planted with *Fuchsia Dunrobin Bedder*, a pretty little flower of the Riccartoni type, but dwarfier; it is edged with *Pillar of Gold Fuchsia*. A pretty bed is planted thus:—Centre, pyramidal Fuchsias, *gracilis variegata* and *Beauty of Exeter*, planted alternately, the carpeting beneath being *Alternanthera magnifica*; "dot" plants of scarlet-flowering *Begonia*, edged with *Lobelia Earl Beaconsfield*. A bed planted with *Lobelia cardinalis*, carpeted with *Viola Mrs. Turner*, will make an effective one later. At present, it is rather dull. A very showy bed is one of *Petunias*, with *Begonias* between, carpeted with *Alternanthera aurea*, and edged with *Viola Ormonde*. We now come to rather a pretty bed, planted with Ivy-leaved *Pelargoniums* and mixed *Carnations*, carpeted with *Alternanthera magnifica*, having a band of *Phalangium variegatum*, with an edging of *Veronica incana*. Still going east, we have two very telling beds planted with Ivy-leaved *Pelargoniums*, *Souvenir de Charles Turner* and *Henry Cannell*, having *Liliums* and *Zinnias* planted between them, carpeted with *Alternanthera magnifica*, and edged with *Lobelia Blue King*. A very pleasing bed is that planted with short standard Fuchsias, *Begonia heracleifolia*, with the tuberous varieties, carpeted with *Alternanthera aurea*, and edged with *Mesembryanthemum cordifolium variegatum*. There are two beds of *Heliotrope President Garfield*, with *Nicotiana glauca* planted between, the two flowers contrasting admirably. Another bed is planted with *Ricinus Gibsoni*, carpeted with *Alternanthera aurea*, having plants of *Tropæolum Double Orange*, and the single scarlet, which make a pleasing mixture. The whole of this run of beds is divided by a specimen Palm between each, backed up by pyramidal Fuchsias.

Starting again at the Elm tree, there is a double row of beds planted in pairs. A reference to a few of the more noteworthy amongst them: A large circular bed, planted with specimen *Heliotropes* and standard Fuchsias, carpeted with *Alternanthera amabilis latifolia*, with *Phalangium aureum* dotted between, the whole being edged with *Viola lilacina*. This bed is flanked on either side with some specimen *Eucalyptus* and scarlet *Tropæolums*, trained in pyramidal shape.

A good show is made by four *Begonia* beds—crimson—with a carpet of *Lysimachia nummularia aurea*, edged with *Fuchsia Meteor*.

At this point occur the only two carpet-beds planted this year. They are, and deservedly so, going out of fashion!

The set of double beds situate a short distance from Grosvenor Gate are planted with a broad band of edging plants consisting of *Violas*, *Lobelias*, *Fuchsias*, and *Veronica Andersoni*, some very effective arrangements being observed amongst them. Very pretty is a circle planted with *Ficus elastica*, *Begonias*, *Phalangium aureum*, and double crimson *Tropæolum* dotted in a carpet of *Alternanthera versicolor*, edged with *Alternanthera magnifica*.

Between the whole of these double-beds are arranged groups of *Bambusa* and *Eucalyptus*, intercepted with specimen Palms.

It is quite worthy of record that there are a great quantity of *Violas* used in the bedding arrangements this year, which tend, without doubt, to add a charm and beauty when thus associated. Considering the dry season passed through, they look remarkably well.

There is a row of beds between Grosvenor Gate and the Marble Arch which are somewhat out of the notice of people passing through the park; these look very gay, being planted with *Pelargoniums*, *Fuchsias*, *Violas*, &c.

One border near Marble Arch is worthy of special mention. It is planted in panels of *Pelargoniums* and *Calceolarias*, which at the present time are making a gay display.

The well-known dell at the east end of the Ser-

pentine is looking well, Dracenas and Ferns giving it quite a tropical appearance. A mixed border on the south side of the Dell, facing Rotten Row, presents a very gay appearance; it is planted with Antirrhinums, Pentstemons, and Gaillardias, having some specimen plants of Fuchsias, Tropæolums, and Marguerites. *J. B.*

CULTURAL MEMORANDA.

SPIRÆA JAPONICA.

This is one of those old but none the less valuable plants that with but little care and attention may be made to flower well, and at almost any time during the early months of the year. True, it is common, and probably on that account has lost favour with some; but still it would be very difficult to fill its place for many purposes. To grow and flower the Spiræa well there should be two lots of plants, so that one lot may have a season's rest, for if the same plants be forced year after year, they seldom produce flowers in true character. During their growing and flowering seasons the plants should be well supplied with water at the root, and afforded nutriment. After blooming is done, the plants should not stay in the pots longer than is needed to get them somewhat hardened, and then the roots may be reduced and divided into two or three pieces, and planted on a well-prepared border. A good stock of Spiræa may soon be reared in this way, and if the clumps are properly grown, they will display their true character when potted up and forced, there being a great difference between plants properly prepared for forcing and those that have been neglected, the latter rarely starting freely into growth, while the flowers are mostly poor. *H. Markham.*

DEUTZIA GRACILIS.

If cut-back Deutzias have made good growth in the cold frames in which they were placed, they should now be stood tolerably wide apart, and allowed full exposure. The cultivation of Deutzia gracilis is simple, and a stock of useful little flowering plants may soon be reared. Pieces of half-ripened wood, with a heel preferably, if dibbled into sandy soil, under a handlight, and well watered, will root readily; but where convenient, the soft cuttings struck in heat early in the spring, and potted and grown on with a few pinchings, make good plants in one season. As soon as struck, pot them off in small thumbs or 60's, and keep them shaded and watered till established, after which time put them in a vinery or Peach-house, near to the glass, till the season is more advanced. Before standing them in a cold frame, they should be gradually hardened off, and thence transferred to a sunny border. When kept in pots, the plants need maore water, and an occasional repotting, but they must not have large shifts. The pot for flowering them in may be a 4½-inch or a 6-inch one. The worst evil that can happen to a Deutzia is a check in growth, which may arise from lack of water, or a sudden change in temperature. The plants should be kept growing, and be liberally treated, till they have completed their growth. The best soil for the final potting is fibrous loam, a small quantity of dried cow-dung or spent Mushroom-bed stuff, and enough sharp sand to keep the whole porous. If the soil is heavy, some leaf-mould should be added. The double variety, *D. crenata fl.-pl.*, is valuable for pot work, although it does not produce its flowers so freely or so early as *D. gracilis*, but they have an advantage in lasting longer. This species is usually met with growing in shrubberies, but is well deserving of pot room. *H. Markham.*

VEGETABLES.

IMPROVED WROXTON ONION.

I NOTICED recently in the *Gardeners' Chronicle* a note on the above fine variety of Onion, and having cultivated it for several years, I should like to bear testimony to its excellent qualities as a keeper. I

have, under ordinary cultivation, grown it to a fair size, and I think it is one of the best for autumn-sowing—better than Tripoli in being less coarse in texture, and keeping much better. I have some now which weigh 1 lb. and more, the seed having been sown last autumn. The plants stood the winter well.

Another Onion, good for either autumn or spring sowing, is the Excelsior, and some just pulled weigh 1½ lb., and most of them average 1 lb. It is of globular shape, very firm, and a good keeper. *F. Q. C., Devon.*

THE WEEK'S WORK.

THE FLOWER GARDEN.

By T. H. CRASP.

DAHLIAS.—Where the plants have been well attended to with water, much progress will have been made, and staking and tying-out should get careful attention, or much damage may ensue from wind and wet. The shoots on plants that will carry show blooms must be kept well-thinned, but if for ordinary garden decoration less thinning will be needed, and only sufficient should be cut away as will allow sun and air access to all parts. Liquid manure, with a little soot added about twice a week, is of benefit to all Dahlias. In the case of exhibition flowers, the plants of the show and fancy varieties should have all flower-buds removed except one on each stem, care being exercised in selecting the buds of most promise. Pompons and decorative Dahlias do not require this kind of disbudding, and may be grown for exhibition in the ordinary manner. Small pots filled with hay may be placed on the stakes as traps for earwigs.

PENTSTEMONS.—These beautiful herbaceous plants will not be so fine this year owing to the drought, although the genial showers of the last few weeks have been of great benefit. The genus consists of plants which are impatient of moisture during their period of rest, *i.e.* the winter season, but require copious supplies in the summer months to enable them to make free growth and fine spikes of flowers. Now that rain has fallen a mulching of rotten manure would benefit the plants, and when this is done, neat stakes should be placed to each plant and the flower-spikes secured to them. If extra fine spikes are required a little disbudding must be performed. At this season cuttings of choice varieties are readily obtainable, and these should be slipped off, and placed thinly round the sides of 48-pots, which may be stood in a shady, close, cold frame, where rooting readily takes place. Seeds may be sown at this time, should no strong plants with shoots fit for cuttings exist. The seedlings will bloom next year. Sow the seeds thinly in boxes or pans of rich light mould, and place in a cold frame, where they may remain till the planting season next spring.

ASTER, GERMAN AND CHINA.—Where beds or borders of these plants are found, and large, well-formed blooms are required, close attention must be paid to destroying aphides, which appear to be unusually plentiful on these plants this year, crippling the foliage sadly, and checking growth. The best method of dealing with aphids on Asters is to mix up a strong solution of soft-soap and water, and sprinkle the plants overhead with it, occasional applications of liquid manure being afforded, as well as a mulch, to encourage growth.

THE YELLOW LUPIN.—*Lupinus arboreus* may now be sown in pans or boxes, placing them in a cold frame, for if the seeds be sown outdoors, the seedlings are liable to be eaten by slugs during the autumn and winter.

ANEMONE FULGENS.—Corms should now be lifted and stored away for future use.

HYDRANGÆA HORTENSIS, &C.—Cuttings of this almost hardy garden plant will now root freely if they are made from shoots of half-ripened wood, and put singly in small pots of sandy soil in a cool frame that is kept close and shaded. These will make good specimens next year.

All plants of which seeds are not required should have the seed-vessels removed as soon as the flowers drop, thus considerably prolonging the season of bloom. If not already done, no time should be lost in removing the seed-vessels from Rhododendrons and Azaleas.

LAWNS AND EDGINGS will now require much attention in mowing and clipping the grass now growing rapidly. Recently sown seeds of grasses and Clovers for the purpose of covering the brown patches on the lawn have had favourable weather for their germination; and those who did not do as was suggested at the time may still do so during the ensuing week, well working the seed into the sward by the use of a good broom, following this with a good rolling.

LATE-FLOWERING HERBACEOUS PLANTS which are tall growers should be staked and tied at once, as the wind after this date is often very destructive in its effects on these plants unless secured.

LAVENDER AND EVERLASTING FLOWERS may now be cut when quite fresh and dry, the latter being put into bunches and hung upside down to dry to prevent dust collecting on them.

THE HARDY FRUIT GARDEN.

By T. TURTON, Gardener, Maiden Erlegh, Reading.

APRICOTS.—As no fruit trees suffer more from winter pruning than the Apricot, the forerights should, after the fruit is gathered, be pruned back to three or four leaves. Any shoots which were left to fill vacant spaces should be secured to the wall; and unless rain should fall in quantity before these lines appear in print, a thorough watering of the soil, especially that within a yard from the wall, should be afforded—it will assist the fruit-buds greatly. Indeed, if such assistance be not afforded the trees, it is unreasonable to expect them to bear well next season.

APPLE AND PEAR TREES.—The fruit will suffer considerably this season, unless wasps' nests are taken as far as possible, and the insects trapped in bottles, hand-glasses, &c. Where the crops of early fruits are abundant, it is a good plan to leave a portion of these ungathered, which will have the effect of luring them from the more valuable late varieties, and it is near these early trees that the wasp traps should be set. Any specially fine specimens of Apples or Pears which it may be desirable to preserve may be placed in muslin bags, tiffany, or any material of similar open texture. For the first time I have this season been obliged to have recourse to this mode of protection, and so far have found that the colouring of the fruit is not materially affected thereby. To protect the fruit from the birds, if the trees are too large to be netted over, any particularly fine specimens may be effectually protected by placing a collar of stout paper over the base of the fruit, the aperture made to pass the stalk through to be afterwards closed by being pinned up, and with small nets placed under the fruits in the event of their falling, one is relieved of further anxiety respecting them. The nets that I use are what were made some years ago for supporting Melons, and they answer the purpose admirably. They are 9 inches square, and 1½ inch mesh, with 6 inches of loop at the corners to fasten them by.

WATERING.—Where the means are at hand afford water copiously to the roots of Apple and Pear trees, until a break in the dry weather becomes general. Doing this will prevent premature ripening of the fruit. Damsons and late Plums, if bearing heavy crops, should have thorough waterings, as notwithstanding the recent refreshing rains, the subsoil is still dry, and without sufficient root-moisture, the fruit will not attain to its proper flavour.

PLANTS UNDER GLASS.

By B. WADDS, Gardener, Birdsall Gardens, York.

FERNS.—Special attention must now be given to the watering of specimens as the daylight shortens; plants which have completed their growths should have moderate quantities of water, or yellow unhealthy foliage will result; at the same time the plants must not be kept dry at the roots. Syringe the plants less and afford air night and day during warm weather. Attend well to Ferns in baskets required for winter decoration, affording them weak liquid manure occasionally. Two useful species for growing in baskets and vases are *Nephrolepis tuberosa* and *Woodwardia radicans*.

GESNERAS AND GLOXINIAS going out of flower should have water gradually withheld when the foliage and tubers are matured, the pots or pans being then laid on their sides in the cooler part of the stove or in an intermediate-house. Other species being grown for winter flowering should be kept free of aphids and thrips, and placed near to the glass and not crowded with other plants. Liquid manure in a

weak state may be afforded them, and moisture in abundance in the house, but the foliage must not be wetted.

ACHIMENES require about the same kind of treatment as the above after flowering, water being withheld by degrees.

FUCHSIAS.—Cuttings may now be struck, taking the strong points of shoots and placing them singly in small thumbs filled with fine loam, leaf-mould, and sand, in a gentle bottom-heat. The cuttings must be kept close and shaded, when they will soon strike, and may then be potted off into 6 inch pots, to be grown on in a warm pit or greenhouse without any pinching or stopping through the winter.

PELARGONIUMS.—Cuttings of the show and fancy varieties may now be made from half-ripened shoots. These should be from 3 to 4 inches long, and placed in pots of a mixture of loam, leaf-mould, and sharp sand, some sand being placed on the surface of the mould. Place the cutting-pots in a greenhouse or cold frame; do not afford them much water, only enough to keep them plump. Specimens of these plants should be pruned in hard when the wood is ripe and the soil dry, and be kept dry afterwards by turning the pots on their sides out-of-doors until some slight start in growth is made, then placing them in a frame or light pit, and sprinkling them overhead till growth is more general, when they must be shaken out of the soil and repotted in small pots as they will go into. The best kind of soil is yellow loam and leaf-mould and a small quantity of sharp sand. Much water should not be afforded, but plenty of air and sun-light.

HELIOTROPES.—These, if for flowering in pots during the winter, should now be well-established and making strong growth. All shoots at the present time should have the points removed, and a new break encouraged.

POINSETTIA PULCHERRIMA AND EUPHORBIA JACQUINIÆFLORA, which require about the same kind of treatment, should now be making good growth, but they may be improved by affording them some well-diluted manure, artificial or other. Ply the syringe among the plants on fine days, and keep a moist growing temperature of from 55° to 75° in the house or pit in which the plants are placed. Considerable care in affording water is required at this season if the plants are to be maintained in the best condition; and a pit or house with a path along the middle is the most suitable place for them. Keep the foliage clear of green, black, or white-fly by the use of quassia-water.

TUBEROUS-ROOTED BEGONIAS, when the flowering season is past, should be removed from the show-house to a spare pit to complete their growth, paying great attention to the watering of them for a time. Young plants of *B. Weltoniensis*, if in 60-sized pots, should have a shift into 5 or 6-inch pots. Some of the best of the fibrous-rooted Begonias for winter work are *Glabre de Sceaux*, *Knowsleyana*, *nitida*, and *Vernon*.

THE ORCHID HOUSES.

By W. HOLMES, *Gardener, Peckering Lodge, Timperley.*

THE DENDROBIUMS.—The last of the summer-flowering species, viz. *D. tortile*, *D. t. roseum*, and *D. Bensoniæ* are growing freely after having been rebasketed or surface dressed; the last-named one being grown by me in pots, and is well syringed daily in order to keep the plants free as may be from red spider. If this be not done the plants are apt to be much infested, with the result that many of the leaves are lost. Our plants of *D. Dearii* have also received new baskets if the old ones have become decayed, and they have begun making growth; and when established in the new compost of peat and a small quantity of sphagnum moss, they will be copiously syringed. The plants are growing in a hot moist house, shaded to a fair extent during the sunniest part of the day. The plants of *Dendrobium rhodostoma*, a hybrid, are nearly always in flower, and a beautiful variety it is. The pseudobulbs, 3 feet in length, flower at different times along the whole length. A plant of it is now in flower here, which has borne flowers at nearly every node during the last three years. Plants of *D. Phalæopsis*, *D. P. Schroderianum*, *D. bigibbum*, *D. superbiens* are now making free growth, and some of them have begun to push up their flower-spikes. These species will need copious watering and syringing now that they are placed in a moist house of high temperature. Any newly-imported plants of *D. P. Schroderianum* which may be at this time starting

to grow at top, and to make new roots, should have some peat and sphagnum moss placed about the latter. I place only clean crocks about the roots when these new importations are first started, and add the peat and sphagnum later. I would draw the attention of those who may have newly-imported plants to examine them closely for a destructive weevil, which came over with some recent importation, which ruined a great number of plants. If the insect be detected, the best and surest cure is to cut away the pseudobulbs clean, as neither fumigation nor dipping the plants in any kind of insecticide will kill them in their retreats, the centre of the bulbs, which they arrive at by gnawing a way from the bottom to the top, entrance being made in the rhizome. *Dendrobiums* on rafts or in shallow baskets or pans with very little material about their roots should be well syringed, and sometimes dipped in a tub of water, always observing to soak the material. *D. Falconeri*, *D. Devonianum*, *D. Wardianum*, and the pretty *D. pulchellum* are chiefly grown in this manner. *Dendrobium aggregatum* is another which grows satisfactorily on a wooden raft. All *Dendrobiums* should be growing freely at this period, and ought not to lack moisture; and when they are healthy, roots in quantity are pushing forth, and the young pseudobulbs well advanced in growth, weak manure-water may be afforded once in seven days. A few *Dendrobiums* are about the end of their active growth for the present season; of such are *D. Wardianum*, *D. nobile*, and *D. crassinode*, that were started early, and such as these should be afforded water in such quantity as will not cause new growth to be made; but the plants must not be kept in a dry condition, only less water afforded, and they should still remain in the house in which growth was made for some time longer, but affording them the fullest amount of sunlight that is safe.

ANGULOAS.—The species *A. Clowesii*, *A. Ruckerii*, *A. eburneum*, and any other species now completing their growth, will need considerable supplies of water, and occasionally of weak manure-water.

THE KITCHEN GARDEN.

By H. C. PRINSEP, *Gardener, Buxted Park, Cuckfield.*

SEASONABLE HINTS ON WORK.—At this time of the year, especially after a season such as we have lately passed through, garden refuse of all kinds has grown apace; and so as to avoid the usual unsightly rubbish-heap, it should be mixed with stable dung and fermented under a covering of soil, the result being a valuable manure. Failing this, it may be burnt, although this is a wasteful proceeding, except for such rough stuff as will not readily decay. The burnt portion forms a valuable fertiliser as a top-dressing, containing, as it does, a large amount of potash; Celery, Broccoli, and late Peas will derive benefit from it. Keep the hoe going in fine weather amongst Lettuce, Endive, Coleworts, and Onions. Thin out, where overcrowded, the Kalea, Kohl Rabi (when not transplanted), Savoys, and Broccoli, for nothing is gained by growing too thickly. Where possible a good stock of bracken should be gathered in while it is green, for it is much tougher and lasts longer when cut at this season. Bracken is very serviceable for protecting Broccoli, Celery, and other plants during the winter.

CAULIFLOWER.—On light ground Cauliflower seed should now be sown, choosing for the seed-beds an airy situation; but on strong land or low-lying gardens, the sowing should be delayed for another week. Much often depends on the time of sowing, the latter differing in the various parts of the country; no fixed dates can be laid down for it. In mild winters, if the seed be sown too early, the plants are apt to get too large before it is safe to transplant them to the open quarter or warm border; and if sown too late, progress is slow in the event of a severe winter. As a rule, however, autumn-raised plants are not to be depended upon for the first supply, the small-headed early varieties, raised from seed sown in January in warmth, turning in fully a fortnight before them.

ENDIVE.—The early lots being fit for blanching, the plants should be covered or tied up when the leaves are dry. Continue to transplant Endive, and make another sowing.

PARSLEY.—Plants from recent sowings may now be transplanted. The more exposed sowings are seldom cut up before the end of the year, so that if a sheltered piece of ground be planted at this season, a supply will be afforded that will last till late in the winter.

Another sowing should now be made to produce plants for protecting in a cold frame, as it is in early spring that the supply of Parsley gets short, particularly after a winter of some rigour. The plants from this last sowing will afford leaves next summer before going to seed, while those sown earlier in the season will throw up their flower-spikes in spring.

RADISHES.—Sow seed in a sunny situation, on light, rich ground, with the manure, if any be necessary, but a short distance from the surface. The best kind I ever grew at this season is "The Sutton."

MUSHROOMS—It will now be necessary to begin to prepare beds in the Mushroom-house, for although at the present time good Mushrooms may be gathered from beds in the open, the time will soon arrive when we may expect cooler weather. It is advisable to still have the manure prepared in a shed facing north, as it will not then dry rapidly, and is not liable to get overheated. The best of stable-manure may be obtained, but if it is allowed to get too dry or to over-heat before the beds are made, the results are not satisfactory. It is important, therefore, to pay much attention to the preparation of materials.

FRUITS UNDER GLASS.

By M. TEMPLE, *Gardener, Carron House, Falkirk, N.B.*

PINES.—Suckers of Pines are readily procured at this season, and to make a beginning to grow this fruit (still much in favour by those who prefer their own to foreign), the present is the proper time for making a start. Bottom heat from hot-water pipes renders the work safe, and reduces labour materially, as compared with earlier methods. If the suckers are of a good size, they should be firmly potted in 7-inch pots, and it is well to have the pots filled with roots by the end of the year, so that they will be ready for a liberal repotting after the middle of January is past. All Pines should now be growing steadily, and growth kept stocky by a free admission of light and air, and plants that are carrying growing fruit should be frequently examined in order to ascertain the condition of the soil in regard to moisture. Continue the early closing of the houses with sun-heat, letting the heat run up to about 85° or 90°; syringe the plants lightly overhead, but passing over plants in flower. Much indiscriminate use of special manure, of which the users know nothing, is now made, but I would advise that rather than run any risk with these, it will be better to leave them alone.

VINES.—The wasp pest is unusually severe this season—a fact doubtless due to the dry, warm weather, and all vineries where fruit is hanging must have some means used to keep out the wasps and flies. Bottles half-filled with beer, and sugar mixed in it, are used by many for trapping the insects, but exclusion is the more satisfactory plan. Hexagon netting, perforated zinc, and other material are employed; but none of the preventive measures should exclude the necessary supply of fresh air, without which Grapes will not ripen. Outside and inside borders should be lightly loosened with a digging-fork or Kentish hoe, which will have the effect of keeping the surface friable, and preventing the cracking open of the soil. Water should be supplied in the morning in order that the air in the house may become dry before nightfall; and fireheat to prevent damping of the berries should be used, and if the bunches are very compact they will require much attention, especially in damp and close weather. Wash the foliage of Vines with the syringe occasionally when the fruit is gathered, endeavouring to keep it green and healthy till the wood is quite ripe and the buds plump. It is an old practice of mine to remove all the buds from the shoots of Vines that will be forced early except those which are to be left when pruning is performed.

MELONS.—Plants now growing freely should not be rendered unfruitful by a close atmosphere and high temperature, and a free circulation of air early in the day does much to secure short-jointed fruitful growths, as does a steady bottom heat and careful watering with tepid water. Cold currents of air must not reach the foliage, and the surface of the bed should be kept in a moist but not constantly wet state, and the stems at the ground level should be kept dry after this date. Lime and small charcoal mixed is a good preventive of canker of the stem. Stop, train, and thin the bine at short intervals, in order not to give a check.

STRAWBERRIES.—Plants potted last month will be well rooted, and they should be often shifted about to prevent the roots entering the bed of coal ashes or gravel on which they stand. Keep runners removed.

EDITORIAL NOTICES.

LETTERS FOR PUBLICATION.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for contributions, or to return unused communications, or illustrations, unless by special arrangement.

PLANTS, &c., TO BE NAMED.—Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be carefully packed and numbered, and not more than six should be sent at one time.

LOCAL NEWS.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

ILLUSTRATIONS.—Photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c., are particularly solicited; but the Editor cannot be responsible for loss or injury.

NEWSPAPERS.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Advertisements should be sent to the PUBLISHER.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—62° 2.

THE very desirable mode of holding land for garden and *petite culture* generally in small parcels is gaining ground, thanks to the efforts of County Councils, and the provisions of the amended Small Holdings Bill. This Bill as it stands is scarcely so effective as it might be made, for want of a clause conferring compulsory powers of purchase or lease; in fact, in the words of Mr. JOHN MORLEY, it is "not worth the paper it is written on." But this is a matter that may shortly be rectified; in the meantime, some amount of benefit is being conferred on rural and extra urban communities by the increasing facilities of obtaining allotments for garden purposes. And *à propos* of extra urban allotment holders, our old correspondent, "A. D.," sends the following:—

"How far the very increased demand for allotment gardens is due to Allotment Acts, to the action of county councils in disseminating wider information on gardening, or to the natural requirements of a people ever fond of gardening; at least, it is certain that the demand is developing rapidly in all directions, and under conditions that sometimes create wonder and admiration. I have lying before me a request from a working-man living at Bethnal Green, of all places in the world, who has taken an allotment of ground under the London County Council at West Ham, a long way from the man's residence. He has some 16 rods, and there are at the Mill Meads about 100 of similar allotments. The ground is covered with long coarse

grass, and he wants to know how best to proceed under the circumstances, as, to use his almost pathetic words, he has but 'little experience.' Probably plenty of advisers could be found who would say, best leave the allotment alone. Not so this poor man, or myriads of others. The land hunger, even though it be for but a few rods, is strong within him; and although the job, especially that it lies so far from his home, is a tough one, yet with the help of good advice and kindly encouragements, he will eventually do well. Not all a nation's heroes are found in the ranks of war. Peace hath her victories, not less glorious; and the poor artisan, shut up in some gloomy workshop all the day, and condemned to live in a gigantic wilderness of bricks and smoke, always will be a hero when he gets on to his few rods of land, and if at first daunted at the nature of his task to subdue the stubborn soil, correct its evils, and convert it into a little paradise, even if but of Potatoes and Cabbages, will eventually accomplish his work, and reap his well-merited reward. This may be after all but crude horticulture, but it is none the less very useful and pleasing, and the case serves to illustrate the undoubted fact that whatever may be special causes operating to prosecute the demand for allotments, the greatest general cause is that undying love for gardening which so universally animates the British people. But Allotment Acts have, all the same, very much to do with the increased demand, and for the obvious reason that where ground is provided by the local authorities it is so supplied more free from arbitrary or exasperating conditions, and the tenure of the holders is far more secure. I have just met with a case in point, in a parish just outside that of Kingston, where allotments have been furnished for some six or seven years, by a landowner. These, nearly 100 in number, in divers fields, have been all taken up and generally well cultivated and cropped. Still, there never has been any material hold on the land, as it was all held subject to six months' notice. Still, the rent, 1s. per rod, £8 per acre, fully twice the rent paid for agricultural land close by, gave the owner a very profitable return. Recently the owner died, and now all is anxiety and distrust, and the allotment-holders naturally wish the local authorities to step in and secure this or other land for allotments, that their tenure may be enduring. What wonder is it that even gentlemen seeing the painful position in which these allotment-holders may be placed, now express strong desire, not only that the Parish Councils Bill may become law, but also that those new local authorities may be armed with full powers to acquire land for allotment purposes. Only very recently nothing was thought to be a greater forlorn-hope than the provision of allotments for the new borough of Richmond, Surrey. The original suggestion was almost laughed out of existence, but those who wanted allotments persevered in spite of ridicule, and although the original effort to obtain land in the Old Deer Park fell through, yet eventually some 20 acres of capital land were obtained, near to Mr. Kinghorn's nursery, that were marked out, divided into one hundred and ninety-six plots of diverse dimensions. All were at once taken up at 1s. per rod, and all have been this year, for the first time, cultivated, and remarkably well too. And yet the workers are, in many cases, men whose vocations are as diverse from that of gardening as can be. Very few knew anything material about it, and yet the result, even in so adverse a season as the present has been, has exceeded expectations. Is not such a result rich reward to all who have laboured so earnestly for allotments in this town? The demand has now spread to the more populous town of Kingston, and at the present moment a memorial to the corporation, signed by over one hundred working-men of the borough, is before that body asking for allotments, and I have no doubt but that somehow they will be furnished. I am told that, with a little exertion, five hundred signatures could have been obtained, and doubtless it is so. These facts suffice to show how the allotment demand is growing. Twenty years hence, allotment gardening will prove to be a potent factor in England's welfare."

NIGHT-FLOWERING CEREUS.—The illustration which we give at fig. 36 of a flower of *Cereus grandiflorus*—one of the night-flowering species—was grown in the garden of H. HOLE, Esq., Quorn Lodge, Loughborough. The woodcut was taken from a photograph sent us by Mr. FROST, photographer, of Loughborough. Owing to the nocturnal habits of the flower, the difficulty of securing a good photograph was not inconsiderable. By the use of incandescent magnesium ribbon, however, Mr. Frost has succeeded very well. The night-flowering species of *Cereus* are among the most gorgeous of Nature's beauties. When seen they always excite admiration, and yet they are so rarely seen, that even professed gardeners do not know them. There are several night-flowering species, mostly natives of the West Indies and Central America, where they trail from rock to rock, having relatively little attachment to the soil, but emitting aerial roots from the stem like an Ivy. In cultivation they do well against a back wall of a lean-to, either planted out or in a pot. They need very little soil, but demand perfect drainage. When growing in summer they should have a drenching once in a week or ten days, gradually reducing the frequency of watering till in winter, say from November to March, no water at all should be given. One of the finest plants we ever saw was grown in an old-fashioned lean-to heated with a brick flue, such as is never seen now-a-days. *C. grandiflorus* has the sepals of a cinnamon-brown, the petals of the purest white, with a delicious fragrance like that of Cedar pencil or vanilla. It is very interesting to watch the movements of the stamen towards the stigma, one after the other, as if it were a presentation at Court. This habit seems to show that the plant is fertilised by its own pollen; the pure white and rich perfume, on the contrary, suggest insect agency. Perhaps some West Indian correspondent can give us information on this point; and Mr. WATSON, who tells us that *C. Lemairii* produces seeds freely at Kew, could enlighten us on the matter. *C. Lemairii* is less common; the scales on the flower-tube are crimson instead of brown. *C. Macdonaldiae*, a native of Honduras, is like *C. grandiflorus*, but with even larger flowers (14 inches in diameter), and with cylindrical not angular stamens. *C. nycticalis* is also like *grandiflorus*, but has orange-coloured sepals. *C. triangularis* has triangular stems, and green sepals. Other night-flowering species are mentioned by Mr. WATSON in his *Cactus Culture for Amateurs*, but they are seldom seen in private gardens. *C. fulgidus* (*Bot. Mag.*, t. 5856) is one with deep orange sepals and crimson petals, grown at Kew, and supposed to be of hybrid origin. Night-flowering *Cereus* first flowered in the garden of the University (?) at Altorf in 1747, but it had previously flowered at Vienna. In this country it first flowered at Hampton Court, where it was introduced in 1690.

SIR TREVOR LAWRENCE ON GARDENING.—In opening the exhibition of the South Park (Reigate), Cottage Garden Society, held on Saturday last, Sir Trevor Lawrence, speaking as the President of the Royal Horticultural Society, said he had always held that horticulture and agriculture were closely allied, but much regretted to find that the latter most important interest was just now in such a depressed condition. He thought that if gardeners or others could offer any practical suggestions as to how agriculture could be helped they would be gratefully welcomed. To him the most interesting part of the show was found in the cottagers' products, because he had always found that well-kept gardens and pretty flowers were invariably associated with greater domestic comfort and happiness. Gardening was a healthy vocation, but in relation to its products as food he thought we were as a people too conservative in fondness for so much meat, when vegetables and fruit were more healthful. It was specially to the credit of cottagers that with the very limited time at their disposal they did their gardens and allotments so admirably, often showing produce that equalled those of the private gardeners. But the public generally little understood how much they owed to gardeners, for whilst there had been gathered

FIG. 36.—*CEREUS GRANDIFLORUS*.

From a photograph by Mr. Frost, taken by the aid of magnesium light. (See p. 186.)

from all parts of the world exotics or vegetable products of every description, yet it was the gardeners who had developed from those diverse things the most varied and beautiful flowers and other products we now had in such abundance. Reverting to the uses of vegetables as food, Sir TREVOR said that we did not sufficiently understand their proper presentation in a cooked condition, for were they thus improved he thought vegetables would be even much more largely consumed than now. He once had a French cook, and having some Broad Beans to be sent to table, found his cook boiled them when shelled, then removed the skins, and so sent them up. That being wrong, he next boiled them in the shells, and that not pleasing, after other trials the right course was found. It was in cooking vegetables well and presenting them in an appetising way that they would become so much more largely consumed. Referring to the Royal Horticultural Society he said that it was endeavouring to promote a wider and higher knowledge of gardening through the institution of annual examinations for gardeners, and others. Of course, mere theory alone would not make a gardener, but the aim of the examinations was to ascertain how far both theoretical and practical knowledge was sound, for no gardening could ever be successful that was not based on sound principles. A cordial vote of thanks was awarded to Sir Trevor at the close of an interesting address, of which the above is a brief outline.

MR. GOLDRING is now in England, and proposes to remain here for some eighteen months. On his way from India this time, Mr. GOLDRING has paid a visit to Japan, thence to the Sandwich Islands, California, Colorado, Chicago, &c. Mr. GOLDRING speaks in the warmest terms of his trip, and was particularly struck with the parks, cemeteries, and public gardens of the United States.

MR. QUINTIN READ has been appointed by the Worcestershire County Council an Assistant Instructor in Horticulture.

GLEICHENIAS.—Mr. CHARLES EASTWOOD, of Lud-denden, sends us a photograph of his house of *Gleichenias*, and specimens of *G. dicarpa* and *G. flabellata* in 3-inch pots—nice little plants, suitable for growing on or for decorative purposes. Some people experience difficulty in the cultivation of these plants, but Mr. EASTWOOD clearly has overcome the difficulty, if he ever met with it.

BORDER CARNATIONS.—Messrs. LAING & MATHER, of Kelso, send us a box of Carnation blooms of great freshness and beauty. The blooms were cut from the open from layers planted outside last autumn. Lady Nina Balfour is a variety newly introduced by the firm, of a lovely pale pink colour, very full, with even petals, and the calyx shows no tendency to split; Duchess of Fife is a beautiful shade of rose; Kelso Abbey is a yellowish-buff, flaked with crimson; Master Evan is similar, but the crimson markings are deeper and broader; Daudas Scarlet is a pure scarlet of good form. We have not space to give more illustrations; it must suffice to say that the collection was among the best we have seen this season.

WILTS HORTICULTURAL SOCIETY.—It has been decided to hold this exhibition at Wilton Park, and not in the Palace Grounds, Salisbury, as was previously arranged and announced. It will take place on the 16th inst.

CUPRESSUS MACROCARPA VAR. LUTEA.—Remarking on the comment of our reporter concerning the plant of the above which DICKSONS, Chester, exhibited at the last meeting of the Royal Horticultural Society, the exhibitors state that this plant had not come out of a greenhouse, but was taken direct from the open ground.

INTERNATIONAL BOTANICAL CONGRESS.—The Congress for 1893 will be held at Madison (Wisconsin, U.S.A.) on Wednesday, August 23. Questions of nomenclature and terminology will be considered. The American Association for the

Advancement of Science holds its meeting in the same city in the week previous. Section G is devoted to Botany. The Botanical Club also meets during the same period, as well as the Society for the Promotion of Agricultural Science, and the American Microscopical Society.

THE VOLE AND ITS ENEMIES.—The Board of Agriculture is sending out a pamphlet about the field vole and its enemies, which should prove most valuable to those farmers and game-keepers who are wise enough to profit by it. The plague of voles is no new trouble either in England or Scotland, and careful investigation has shown both the cause of the pest, and the right way of dealing with it. Voles are enormously prolific, their numbers under natural circumstances being only kept within reasonable limits by the various species of birds and animals which feed upon these rodents. Instead, however, of owls, hawks, weasels, &c., being allowed to breed in peace, they are ruthlessly shot down, with the inevitable result that the balance is destroyed, and the voles multiply to excess. The reason for this mistake is ignorance; farmers and game-keepers regarding all creatures not "game" as "vermin." Hence the destruction of the short-eared owl, whose usefulness can scarcely be over-rated; the kestrel, which the keeper is pleased to call a "hawk;" and true hawks, which when recognised at all, are rarely correctly distinguished one from another. Buzzards, rooks, and other birds also destroy voles, but in less numbers. Stoats and weasels again are "among the deadliest and most persevering enemies of small rodents;" yet these also are shot down or cruelly trapped. So long as those who suffer from the plague of voles persist in ignoring the proper means of checking it, the pest will increase more and more. Now that the cause and remedy of the trouble have been so plainly set forth, the evil, if it be permitted to continue, can only be regarded as a fitting retribution on those who so foolishly and cruelly exterminate their best friends.

HOLLYHOCKS AT HAMPTON COURT.—Anyone who has been, or even yet may be, privileged to see the remarkably fine lot of Hollyhocks at Hampton Court, blooming so effectively this summer, will naturally wonder why it is that plants can do so well there, and yet be so scarce almost everywhere else. The fine strain there growing is from a private source. The plants were got out early last year, so that some flowered moderately, but this year all have bloomed profusely, throwing up two and three spikes from 7 to 8 feet in height, with numerous side shoots. Some of the plants were thus literally cones or pyramids of flower. Many of them have blooms of the most perfect doubleness, quite equal to the best of the florists' strains, and colours range from pure white, down through varying shades of crimson and violet. If what is so well done at Hampton Court in relation to Hollyhocks cannot generally be done, some tangible reasons should be given.

CUT-BACK AILANTHUSES.—In the border that fronts the old tennis-court at Hampton Court Palace, there are several stout young Ailanthuses, which are kept dwarf by hard cutting-back every winter, and then the following spring they break again, throwing up very finely—indeed, most luxuriant growths, varying from 5 to 8 feet in length. Thus kept dwarf, these trees have a very fine effect, as the foliage is of the noblest and most beautiful, associated with any hardy tree. The stems left standing vary at from 4 to 5 feet, but the yearling shoots are cut back annually to but a few inches. There seems to be no reason why the main stems might not be kept much shorter. Treated in this hard way, with Golden Elders and Catalpas, a very fine effect would be produced.

MUSEÆ.—Mr. J. G. BAKER has recently published in the *Annals of Botany* a synopsis of the genera and species of Museæ. The genera are four in number—*Heliconia*, *Strelitzia*, *Ravenala*, and *Musa*. *Heliconia* has twenty-nine species. Some of the garden forms, as *aureo-striata*, *triumphans*, *striata*, *Seemanni*, are probably referable to *H.*

Bihai, while *H. lencogramma*, Hort. VAN HOUTTE, proved when it flowered to be a *Calathea*. *Strelitzia* has four species and several varieties. *Ravenala* has two species. *Musa* is credited with no fewer than thirty-two species, primarily distinguished by the bottle-shaped or the cylindrical stem; flowers many or few to a bract; petal tricuspidate, or oval acuminate or linear. *M. sapientum* has numerous sub-species and varieties more or less imperfectly definable. *M. Basjoo* has proved bardy at Combe Wood.

NEWCASTLE-ON-TYNE BOTANICAL AND HORTICULTURAL SOCIETY.—From information received from the Secretary, Mr. JAS. J. GILLESPIE, Jun., we are pleased to hear that the recent exhibition was a great success in all respects. This proves the wisdom of amalgamation with the Agricultural Society, the whole forming a vast display. Other influential societies like that of Newcastle-on-Tyne should take the hint, whenever it is possible for horticulture and agriculture thus to mutually join hand in hand for their exhibitions.

GRAPE THE DUCHESS (*Revue Horticole*, Aug. 1).—A Grape of American origin, in spite of its name. It is called also the Poor Man's Grape, by reason of its productiveness, the small quantity of manure that it needs, and its immunity from mildew, so that grown side by side with Chasselas, which demands sulphur and copper sprays twice or oftener in the season, the Duchess needed neither. Again, it is stated to be little affected by Phylloxera. It is a small round white Grape, of the Chasselas character, of agreeable flavour.

DRAGON'S BLOOD.—Professor FLUCKIGER, of Strasburg, writing in the *Journal of the Pharmaceutical Society* concerning our note on this subject, says that the pods figured by MONARDES may be those of *Pterocarpus Draco*. "Its corky indehiscent pod of nearly orbicular outline tolerably answers to the figures of MONARDES, and the solitary kidney-shaped seed—if duly shrivelled—may [might] remind a fantastic observer of what he supposes to be a dragon."

"THE BOTANICAL MAGAZINE."—The plants figured in the August number are:—

Phaius tuberculatus, Blume, t. 7307. (See *Gard. Chron.*, 1881, i. f. 67; 1882, p. 565, f. 101; 1884, vol. i., p. 520, f. 104.)

Sphaerolobium grandiflorum, t. 7308.—A South-west Australian leguminous shrub, with slender, terete, pendulous branches, mostly destitute of leaves. Flowers numerous, in pairs along the ends of the branches; standard yellow, with a red blotch at the base; wings red. A beautiful greenhouse plant.

Brownlea curvula, Harvey, t. 7309.—A terrestrial tuberous-rooted Orchid, from South-eastern Africa. It has the habit of a *Habenaria*. The flowers are in racemes, each of a slaty-blue colour, dotted with purple spots, and with a very long curved spur.

Ilex conocarpa, Reis, t. 7310.—A Brazilian shrub, with inconspicuous flowers, but interesting as one of the sources of Paraguay Tea or Maté.

Musa Mannii, t. 7311.—A species giving off stolons at the base of the stem, with long petioled leaves; bracts rosy-pink; flowers yellow, half the length of the bracts.

ROYAL SCOTTISH ARBORICULTURAL SOCIETY.—A large contingent of this Society is on tour in this country. They visited Windsor on Tuesday and inspected the State Rooms, gardens, farm, the Great Park, &c. Among other places Dropmore, Cliveden, and the New Forest, will be visited, and to-day, the party will be present at Earl's Court to examine the Forestry Exhibition.

THE DEVELOPMENT OF POTATO TUBERS.—It is a well-known fact that the buds towards the summit or anterior portion of the tubers of the Potato develop with more rapidity than those near the base or posterior portion. This fact recently attracted Mons. A. PRUNET to the study of the composition of the anterior and posterior parts of the

tuber; and he found that the anterior portion was generally richer in dry substances, carbohydrates, nitrogenous substances, organic acids, and particularly in the salts of potash, magnesia, and phosphoric acid. During the early stages of development the nutritive substances are evenly distributed throughout the whole of the tuber, and it is only when it has attained its full size that a transport takes place in the interior tissues towards the buds in the anterior portion (*Comptes Rendus*, cxv., pp. 751-52).

HORTICULTURAL SHOW AT CHESTERFIELD.—We are pleased to note that a Horticultural Society has again been established at Chesterfield. Until ten years ago an annual show was regularly held, but through lack of sufficient support it was allowed to lapse. A new committee was this year appointed, and their show held on Wednesday, the 2nd inst., and in connection with the opening of the new Queen's Park, was a well-earned success. The most satisfactory of all the exhibits were the Roses, especially those shown by Messrs. COCKER & SONS, Aberdeen, who managed to beat such champions as Messrs. HARKNESS & SONS, Bedale. There should be no difficulty in firmly establishing the Society, if the residents in the district are alive to the importance of a technical knowledge of horticulture, which should always go hand in hand with these exhibitions.

PLANT PORTRAITS.

AQUILEGIA CHRYSANTHA, *Revue de l'Horticulture Belge*, July 1.

AZALEA INDICA FORTIANA.—A sport from Sigismund Rucker, raised by M. Fortie of Ghent, and exhibited by him at the Quinquennial, where it obtained a 1st prize. The flowers are semi-double, white, flushed with rose, and with spots of a deeper colour. *Illustration Horticole*, t. 180.

BOOK NOTICE.

AMERICAN GRASSES.

In October, 1892, the first part of an exceedingly valuable work on *The Grasses of the Pacific Slope of the United States of America, including Alaska and the Adjacent Islands*, under the authorship of the late Dr. Geo. Vasey, was issued by the Washington Department of Agriculture. The second part of the work has now been issued under date June 1, 1893. In the introduction, Dr. Vasey says the grasses which are known to grow on the Pacific slope of the United States, including Alaska, number not far from 200 species. These are nearly all specifically distinct from the grasses of the plains and of the desert, except in that part of California which partakes of the desert flora.

A considerable number of the grasses of the mountain regions of California, Oregon, and Wash-

ington, reappear in the mountains of Idaho, Montana, and the interior Rockies. The interior of California is a dry region, verging in the extreme south into the desert country, and is deficient in grasses, especially of those species which form a continuous turf.

The work both of the first and second parts comprises mainly those grasses which are most conspicuous in size and apparent utility. Very few of the grasses illustrated in the second volume have ever been figured before, many of them, indeed, being new species.

The engravings are admirably executed: we are confident, therefore, that the work will be of great value not only to botanical students, but to all persons interested in agriculture, and in raising of domestic animals of the farm. *J. J. Willis, Harpenden.*

ORCHID NOTES AND GLEANINGS.

LÆLIO-CATTLEYA ELEGANS.

SOME flowers of a superb variety of what used to be known as *Lælia elegans* of the Turner section have come to hand from Joseph Broome, Esq., Sunny Hill, Llandudno, the owner of that gorgeous form of the same plant, *Lælia-Cattleya elegans Broomeana*, and which makes it difficult to give varietal names to other forms which have arisen subsequently. The segments of the flower are 3½ to 4 inches in length, of clear rosy-purple colour, the veining being the darker. The side-lobes of the showy labellum are sulphur-yellow, tinged with purple on the outside; the brilliant mauve-purple front-lobe is 2 inches broad, and the entire flower bold, handsome, and delightfully fragrant. The spike of nine flowers forms a fine bouquet. Here and there are a few stray dots on the segments, which was one of the signs which caused me in 1861 to arrive at what is now generally admitted to be the correct reading of the hybrid origin of this plant, and its difference from the light-coloured forms which were then included with it. In the *Gardeners' Chronicle* for October 27, 1883, in an article on *Cattleyas* and *Lælias*, I there stated that in 1861 I had worked out the problem that the set of plants known in gardens as *L. elegans* were of hybrid origin, of two sets of parents, the *L. elegans* Turner section being from *L. purpurata*, and the form of *Cattleya guttata* found growing with it, and the light-petalled forms from *L. purpurata* and *Cattleya intermedia*. It has taken over thirty years to have my views on these points confirmed, and I fear it will take many more years before the proper names—*Lælio-Cattleya elegans* (for the Turner section), and *L. C. Schilleriana* for the other—will get into general use in gardens.

A good explanation of the matter, and a separation of the varieties under their proper heads, appears in *The Orchid Review* for August, 1893. *James O'Brien.*

MILTONIA SPECTABILIS RADIANS.

A fine form of this pretty variety is in flower in McArthur's Nursery, Maida Vale, being one of a remarkably fortunate importation of Brazilian *Miltonias*, out of which has flowered some very large *M. candida grandiflora*, *M. Clowesii* major, and *M. C. castanea*; *M. spectabilis atrorubens*, *M. s. bicolor*, and now the variety mentioned above. Its large labellum is of a clear white, a crimson blotch at the base, from which six or eight clearly-defined crimson lines radiate. *Miltonia Roelzii alba* is also in flower in the same nursery, with four flowers on one spike and two on another.

MASDEVALLIA CALURA.

This singular species, which has dark chocolate-purple flowers, of the form of those of *M. maculata*, is still very uncommon, a regular importation of it having as yet not been made, those existing in gardens having come as chance plants with Messrs. F. Sander & Co.'s importation of *M. Reichenbachiana* from Costa Rica. It is a very free-flowering species, and its dark colour and peculiar form make it an acceptable one. A plant is at the present time in flower in Messrs. Seeger & Tropp's Nurseries, 112, Lordship Lane, East Dulwich.

CANNAS, NEW DWARF GLADIOLUS-FLOWERED.

THESE varieties of *Canna* may, as regards colour, be divided into two sections, those in which crimson and red, with other dark shades, predominate, and others in which yellow and orange are the distinctive features. Of the former, as well as the latter, sub-divisions should be made, those with deep crimson or red flowers being as follows: Admiral Gervais, deep red, edged yellow; Paul Bruant, violet-crimson; Alphonse Bouvier, rich crimson; Madame Crozy, crimson, edged gold; Miss S. Hill, purplish-crimson; Avenir, bright cinnabar red; Comte M. de Choiseul, cherry-purple; Edouard Andié, purple-amaranth; F. Benary, rich crimson; Francisque Morel, cherry-crimson; Jules Chrétien, cherry-purple; W. Pützer, rich crimson purple. Those with more scarlet in the flowers, and on the whole brighter in colour, are Pioneer, vermilion, edged with gold; Sophie Buchner, bright vermilion; Nardy Père, glowing scarlet; Thos. S. Ware, rich vermilion; Henri Vilmorin, rich scarlet; Victor, fine scarlet. Those with orange or salmon colours are Progression, orange and crimson; François Thomayer, deep orange; M. Laforcade, orange-red; President, cinnabar; The Garden, saffron; Antoine Chantin, salmon-rose; Jacqueminot Bonnefond, bright saffron; Hippolyte Flandrin, rosy-salmon; President Hardy, clear salmon. Those with yellow or yellow-spotted flowers, are Antoine Barton, yellow, spotted carmine; Primrose, clear lemon-yellow; Comtesse de l'Estoile, bright yellow, spotted lake; Souvenir de F. Gaulain, yellow, with crimson blotches; Admiral Courbet, citron-striped; François Corbin, canary-yellow; Françoise Crozy, clear yellow; Petite Jeanne, orange, edged yellow; Professor David, orange-yellow.

The foregoing list contains thirty-six varieties: of these, *Antoine Barton, *Primrose, Pioneer, and *Sophie Buchner, are sterling novelties of 1893; whilst Admiral Gervais, *Comtesse de l'Estoile, Nardy Père, *Paul Bruant, and *Progression, are the best of the preceding year. Those of 1890-91 are *Alphonse Bouvier, François Thomayer, M. Laforcade, *Madame Crozy, Miss S. Hill, *President Carnot, *Souvenir de F. Gaulain, The Garden, and Thos. S. Ware. Of the older kinds, the best half-dozen are Henri Vilmorin, Petite Jeanne, *President Hardy, *Victor Hugo, W. Pützer, and Jacqueminot Bonnefond. The best dozen of the foregoing are marked thus*.

Colour and Form of Foliage.—In this there is considerable variation, but for all practical purposes the green-leaved and the red or bronzy-leaved form the two main divisions. I have observed that the yellow-flowered varieties have the palest-coloured foliage as a rule, whilst the dark-coloured flowers are borne upon plants with dark green or reddish foliage. Those with red or bronzy leaves are François Thomayer, M. Laforcade, President Carnot, Jacqueminot, Bonnefond, and Victor Hugo.

The Dwarf Cannas as Cut Flowers.—In this way *Canna* blooms are extremely ornamental, but some care is needful in cutting them. Upon close examination there will be found at the base of each spike, enveloped in a sheath, another latent spike, which will start away into growth as soon as the flowers are all fallen from the former. This will continue in the case of a vigorous growth several times in succession; thus, if the spikes be cut when first they commence to flower, it will be at a great sacrifice of future bloom. The better way is to defer cutting until the third spike at least has been developed; then it will be possible, perhaps, to cut them long enough without taking the latent growth should another remain. In a cut state they last in good condition for a long time, and are so entirely distinct as to attract attention at once.

Canna iridiflora Ehemanni.—Previous to the introduction of the dwarfier *Cannas* this was one of the finest for pot-culture, as it now is if tall growth and imposing habit are essential. This variety is very accommodating as to temperature. I have

myself grown it in a temperate-house during the summer, with a cooler or greenhouse treatment during the winter, and flowered it well. It makes a fine conservatory plant. Mr. Green, when at Pendell Court, used to flower it well under stove treatment. I am doubtful, however, if it could be depended upon for outside culture.

Dwarf Cannas for Bedding-out.—For this purpose distinctive colours, and close compact growth, with freedom of flower, are the essential points, as contrasted with the taller kinds of noble foliage, but with less freedom in flowering. Madame Crozy has these essentials, and is the finest kind yet raised; Alphonse Bouvier, President Hardy, Miss S. Hill, Petite Jeanne, and Victor Hugo are also excellent for the same purpose. When intended specially for bedding-out, the better way is not to hasten the growth early in the spring, but rather to allow the plants to come on steadily. Thus treated the growth and foliage also will be more enduring, showing less signs of distress when fully exposed in the open. For planting out, the soil should be well prepared beforehand, good additions being refuse peat, leaf-mould, or old Mushroom-manure. A heavy retentive soil should be guarded against, but on the other hand a light soil, if not kept well watered, does not favour growth. After planting, a heavy mulching will be found of decided benefit. A position should be chosen for these Cannas, where they will not be too fully exposed to the wind, particularly from the east. Plenty of water should be given during the season. When lifted in the autumn, the roots or stools should be well cared for, not being exposed to a temperature below 40°. A medium state as regards moisture is the safer way of keeping them sound. A good plan would be to store them in boxes, with a surface covering of cocoa fibre or old Mushroom manure. Propagation by division can be easily attended to in the spring, each leading growth making a good plant.

Dwarf Cannas for Pot Culture.—It is in this way that we have thus far been able to see the most of this flowering section. For pot culture they should not be starved at the roots, but on the other hand, be treated liberally. Good soil, mainly composed of turfy loam and a little peat or leaf-mould, should be chosen. The loam of itself is disposed to get too close after liberal waterings, hence the need of the other ingredients to keep it in better condition. Road scrapings may well take the place of silver sand, and a little bone meal will not be at all amiss. When started in the spring, a moist temperate house, with plenty of light, will suit them well. Should there be any disposition to increase in height too freely, it must be taken as an indication that less heat will be all the better for them. During the summer an ordinary greenhouse or conservatory will suit them very well. Green fly is the most troublesome of insect pests. Red spider will also disfigure the foliage if not kept in check. Liberal treatment as to watering must be the practice through the growing seasons, with manurial stimulants when pot-bound. By applying warmth, or by removing to a warm house, the same plants will continue to flower well right into the winter season, but little rest being really required before starting again in the spring.

The origin of new varieties.—This does not appear to have been thus far made public; they originated without a doubt in France, and M. Crozy of Lyons has taken the lead in the raising of new kinds upon the Continent, as Messrs. Paul & Son, of The Old Nurseries, Cheshunt, have done in this country. The latter firm have repeatedly shown new varieties, and taken several certificates for their exhibits. Mr. George Paul gives me the information that he has made use of *C. flaccida* for purposes of hybridisation. This species is a large-flowered yellow variety, itself of dwarf habit, introduced from South America in 1788. To this species may be fairly attributed the lanceolate foliage of the yellow kinds. I strongly suspect that *C. Warscewiczii* has been instrumental in the further development of the dwarf section. This species has dark foliage, is of compact habit, and is one of the best for bedding of the

old kinds. The dwarfier kinds will flower under 2 feet in height early in the year, but later nearly another foot must be added to their height as a rule. H.

HOME CORRESPONDENCE.

THE WOOD WASP.—In a communication addressed to *Land and Water*, the superintendent of the Forestry Department of the Earl's Court Exhibition calls attention to the fact that among the exhibits sent to Earl's Court from Windsor Forest is a slab cut from a diseased Scots Fir, and from it have been taken no less than eighteen wood wasps (*Sirex jurencus*), sixteen females and two males, all alive. When recently at Earl's Court, Mr. Cadell called my attention to the matter, and I had an opportunity of inspecting the insects, and saw how they bored through the wood, rendering it useless for economic purposes. Mr. Cadell states that the above species is not of such common occurrence as the *S. gigas*, which attacks Pine and Larch indiscriminately; and the fact that so many specimens have developed in one piece of wood only 3 feet or thereabouts in length, suggests the amount of damage which may be caused by the presence of one diseased tree in a plantation otherwise healthy. The wood is bored through and through, and the wasps also can be seen at the office of the Forestry Department in the Earl's Court Exhibition, and both are full of interest. R. D.

ARCHITECTS AND LANDSCAPE GARDENERS.—Aneant your notes in a recent Number, allow me as a practitioner to make a few observations on the two books to which you refer, and the principle which their writers try to enforce; the late J. D. Sedding's work always had a fascination for me. Of Mr. Reginald Blomfield's work I know little, but some of his designs I have seen, and taken as a whole, I thought they showed true artistic feeling; Mr. Sedding's book *Garden Craft* is one of the most delightful works I have read, so much so that I often make it my railway companion, and I never read it without wishing I had had the chance of grasping the hand now vanished and gone. The pity is that poesy takes the place of definite teaching, but then a garden is a poetical subject. I only wish I could express myself thus on Mr. Blomfield's book, one of the most valuable contributions of late years to garden literature, but overdone with cheap and often unwarrantable sneers at the expense of landscape gardeners. Mr. Sedding wrote out of a love for the garden, but I sometimes think Mr. Blomfield wrote because he despised landscape gardeners. Now the aim and object of these books is to show the connection between the house and the grounds, and that the architect, or landscape gardener for the matter of that, should be an artist, who could design both; so the attack is directed not against horticulture but against those who consider a garden the place for Nature imitation, but both writers look upon Nature as the willing handmaid of design. Surely there is nothing so very unreasonable in this. Even Mr. Repton teaches this much; and he plainly says that gardens are the work of art rather than of Nature. Here is a line of thought which can do none of us any harm, and if as a help to this study we use our sketch-book a little more, especially in the study of architecture in connection with landscape, I think we shall become a little more charitable towards these book writers, and perhaps in return they would become a little more so towards us. In respect to architects generally, so far as landscape gardeners are concerned, they may be divided into two classes—1st, those who take an interest in the setting and surrounding of their houses; 2nd, those who do not; the first are in some sense artists, the second are not. I have worked with both, and notwithstanding a little hard criticism at times, I invariably find pleasure in working with the first-named; respecting the second class, I venture to say nothing. Messrs. Sedding, Blomfield and Thomas have said enough to remind them of lost opportunities, and I hope also sufficient to convince them that a garden is worthy of their regard. If they are being so convinced horticulture will be a great gainer, whilst landscape gardeners may find a place in the altered state of affairs. I do not think the reading of the two books referred to will make the English landscape gardener love his special style any the less. He has too many proofs of its beauty to ever wish to abandon it—beauty acknowledged by architects themselves; but it is well to look at our work with other people's eyes, and if our art is capable of improvement, to profit thereby. *Thomas H. Mawson, Windermere.*

TEA ROSE, ERNEST METZ.—"Wild Rose," in the *Gardeners' Chronicle*, p. 150, writes in rather disparaging terms of the above Rose. Can he be aware of the fact that in an election of the best twenty-four Tea Roses (see *Gardeners' Magazine*, July 1, 1893), The Bride received the highest number of votes, viz., forty-six, and Ernest Metz forty-one? To me this is proof positive that leading Rose growers think most highly of it. All through June last I could gather splendid specimens, the best were over by the National Rose Society's show on July 1. In my opinion Ernest Metz is far away the finest and best Tea Rose sent out during the last six years, and it was shown in fine form at the Tea Rose show at the meeting of the Royal Horticultural Society on June 20. *Benjamin R. Cant, Colchester.*

ARISTOLOCHIA GIGAS.—We have grown this as a curiosity, and it is, unfortunately for its existence, flowering freely. The carrion-like stench of the flower when open is unbearable, and our tropical house will be conspicuous by its absence in future. The flower is large, but the stench is larger, considerably; and to those who think of growing it Mr. Punch's advice to those who intend to marry, is fully applicable. Mr. Punch's advice is—don't. The curious part is that the smell disappears at dusk; the flower is evidently intended to attract the carrion flies and beetles, which are active in the day only, and as its extraordinary "fragrance" is too powerful to be wasted, it is turned off at night. Of all the abominations with which mankind may trouble himself, *Aristolochia gigas* may take a first place easily. *Thos. Fletcher, Grappellall, Cheshire.*

WASPS.—The mixture of sulphur and gunpowder recommended for the destruction of wasps is not safe in all cases. If too dry, the squib explodes; and if too damp, it will not burn. The best and safest mixture for the purpose is two-thirds flowers-of-sulphur, and one-third finely-powdered saltpetre, used dry. A case of the right thickness to push in the hole is easily made by rolling a sheet of paper round a stick, fastening the end with gum or paste; in the absence of either, the gummed margin of postage-stamp sheets is perfectly satisfactory. The mixture of sulphur and saltpetre is packed dry in the case, lighted at one end, and pushed into the opening of the nest. It burns like the firework known as a "blue-light," and the suffocating fumes from a small case will effectually destroy the largest colony. The mixture burns quietly, it is safe and easy to use, and the effects are certain. Any compound containing gunpowder is too uncertain in its action, and there is always a liability to accident, as I have found by unpleasant experience. *Thomas Fletcher, Grappellall, Cheshire.*

MELON THE COUNTESS.—This is a fruit of fine appearance, the skin thin and beautifully netted, and rich yellow in colour, flesh white; with high flavour. The fruits, which are oval-shaped, will attain a weight of about 4 lb. The plant is of robust growth, and the flowers set freely. Mr. Gilman, the raiser, has disposed of the stock of seed to Messrs. Veitch & Sons, Chelsea. *J. Udale.*

CARNATIONS ONE HUNDRED YEARS AGO AND MORE.—At the meeting of the Midland Counties Carnation and Picotee Exhibition in the Botanical Gardens, Birmingham, July 22, Professor Hillhouse, Professor of Botany at Mason's College, Birmingham, and hon. sec. of the Birmingham Botanical Society, placed on view a copy of a very rare work, the *History General of the Insects and Plants of Surinam*, edited by Mdlle. Sybille de Merian, and published in Paris in 1771; who also published works on *The Plants and Insects of Europe*, and *Beautiful Plants of Europe*. The date of these works is approximately 1682, but in 1771 a folio volume of large size, containing the three works, was published in the French language. The volume contains a large number of exquisitely coloured life-size drawings of plants and insects, and as it also contains coloured illustrations of our earliest double Carnation, Professor Hillhouse thought an inspection of the volume would be of interest, especially to those who are cultivators and admirers of the Carnation. Three of the earliest varieties figured are—one under the name of *Cillet pourpre*, a purple striped or rather lined variety with ragged edge; the others named *Caryophyllus purpureus* and *Caryophyllus variegatus*, the latter white with rosy scarlet markings and serrated edge. In the early part of the nineteenth century, our English florists were making great headway in the improvement of the Carnation, and it was

very interesting to note the illustrations of flowers of the eighteenth century, and side by side, a large exhibit of border kinds in many of which the serrated edge still exists, and by their side a large number of blooms of Carnations and Picotees of the finest form and substance, and with perfectly smooth edges, examples of skilful hybridising and culture. *W. D.*

FINOCHIO, OR TUBEROUS-ROOTED FENNEL —

The above was figured in the *Gardeners' Chronicle* for January 28 last, p. 109, and was said to be used a good deal on the Continent, and no doubt many gardeners, myself included, have given it a trial. At the present time I have two long rows about 4 feet high. I have sent it to the kitchen three times for trial, but our cook, who, by the way, is considered a very good one, cannot cook it so as to make it palatable, and it is said to have but very little flavour, and is by no means an inviting-looking dish. Perhaps it requires some special method of cooking to bring out its true flavour. I should be very pleased if other growers who have tried it would give their experience in these columns, and especially the best mode of cooking it. It is a plant of easy culture, and I should say a plot of ground that had carried a good crop of Finocchio would require a very liberal dressing of manure to replace what the plants had taken out of it. *A. J. S.* [Finocchio should be stewed in gravy or soup, like Celery, and served with a white sauce. See *Gardeners' Chronicle*, March 25, 1893, p. 366, where it is stated that it is eaten raw in Italy like celery. *En.*]

LILIES AND IRISES AT WEYBRIDGE.

THE Lilies are in full beauty in Mr. G. F. Wilson's garden at Wisley. Wisley must not be confounded with Heatherbank, Mr. Wilson's residence on Weybridge Heath, as Wisley is a drive of several miles from it, through lovely Surrey scenery. Here is to be seen a fine garden of hardy flowers, each kind represented in quantity, to show the effect of their flowers when thus grouped or massed in a natural way.

The visitor to Wisley in early August and throughout the autumn, more or less, will be repaid by seeing what appears to be a garden of Lilies. This lovely genus is in perfection then, and in spite of the drought the many species and varieties are very fine. The natural character of the place has been changed as little as possible, and there is therefore ample protection from surrounding trees, whilst the Lilies are planted amongst Rhododendrons, which afford protection to the shoots in spring. *L. auratum* is one of the principal species in perfection through August, and Mr. Wilson has all the varieties, the flower-stems in the majority of cases bearing a large mass of bloom. It is interesting to note how much Lilies appreciate shade and a certain amount of moisture. On rising ground, where the soil is naturally drier, the growth is comparatively poor, large breaks of *L. auratum* are to be seen, hundreds of spikes rising from the plants, and in one spot the variety *virginale* is remarkably beautiful, getting protection from Damson trees, which at the same time are not too close to create a dense shade. When a large quantity of one species is gathered together, the variety of colouring is conspicuous, some flowers quite self, others freely spotted with rich crimson, and banded with colour.

At Heatherbank, Mr. Wilson has adopted a simple and very useful way of cultivating *L. auratum* and other showy species by means of tubs. Ordinary paraffin barrels are procured, and sunk into the ground, after the bottoms have been knocked out. They are filled with loamy and peaty soil, and the Lilies attain splendid proportions. The object of this method is to get Lilies in borders skirting shrubberies and similar spots. The ground is usually filled with roots, the soil necessarily poor, and the Lilies dwindle away; but when in tubs, the roots of shrubs are kept away, and the Lilies with proper attention flower quite as well, if not better, than in the open. Then at the entrance to the garden *L. auratum* is very beautiful in tubs, and later on *L. speciosum* or *L. lancifolium* will be in bloom. With dark green-leaved shrubs as a background, the flowers of the Lilies are thrown into bold

relief. Quite as beautiful in August is *L. superbum*, which is planted largely at Wisley. It is a lovely species, very graceful, and the flowers vary greatly in colour. The plant is slender in growth, and the flower-stems rise over 9 feet in height, bearing many flowers. Those of a brilliant scarlet colour like a flame of fire are remarkably striking seen from a distance in this woodland. Some varieties are more yellow than others, and there is considerable variation in the spotting. Few Lilies are more beautiful than this, and no great cultural difficulties have to be overcome. In a clearing in a small woodland near Heatherbank, the Lilies are in rude health, and although not in bloom at the time of my visit there was a rich promise of a splendid display from *L. lancifolium* and its varieties, *L. auratum*, and several other species. *L. Humboldtii*, *L. Leichlini*, *L. Fortunei*, and all the leading species are grown here, but *L. lancifolium*, *L. auratum*, and *L. superbum* are chiefly represented. It is interesting to notice that in this clearing, so to say, Sikkim Rhododendrons are succeeding well, having withstood the winter. There are many similar spots in gardens where they may be tried. In the conservatory attached to the house was a fine group of varieties of *L. lancifolium*. This is a delightful species, and the white variety, *album*, was remarkably well-grown; mixed with the species, it is very beautiful. It is no exaggeration to describe Wisley and Heatherbank as a veritable home of Lilies, grown in quantity, and with no coddling treatment. Similar effects are got in the Royal Gardens, Kew, from this bold use of a handsome flower.

Wisley contains a vast number of rare hardy plants, but the Lily and the Iris, particularly *I. Kämpferi*, are grown more largely than other things. This species is superb, and in late July a few flowers were still open, although by reason of the drought the plants bloomed earlier than usual. In one quarter alone there were 4000 clumps, all Mr. Wilson's seedlings, and many beautiful things may be anticipated amongst these, as all are in perfect condition. Another feature is a little brook, or ditch, winding through this portion of the garden, and on the sides *I. Kämpferi* is planted, the large clumps numbering seven hundred. They occupy the two lower rows, but the upper row is of the earlier flowering species, *I. sibirica* and others. When like varieties of *I. Kämpferi* are in full bloom, this "ditch" is a picture of colour, as Mr. Wilson takes care to select only those that are really beyond praise, fine in colour, sturdy, and effective in the garden. Too little use is made of this species in English gardens, as it is not difficult to grow, if in a good moist soil. Moisture is its chief requirement, and on that account it is useful to plant by lake, pond, or stream-sides. There is also a large pond, around the sides of which *I. Kämpferi* is planted. We have never seen finer growth, and, even without flowers, it has a pleasing aspect. The colours to be got is a good selection of seedlings are very varied, and it is important to avoid those that are mottled or speckled as it were, as these are not pretty, neither do they show to advantage in the garden.

Another plant made great use of at Wisley is *Rosa rugosa*. There are hedges of it, and it is interesting to know that the first hedges made of this Rose were at Wisley. It presents a strong barrier to cattle, by reason of the robust, spiny stems, and at the same time it is beautiful in aspect. The leafage is abundant, and rich glossy green in colour, whilst the large fragrant varied coloured flowers and crimson fruits appear together. There is much variation in the colour of the flowers in seedling plants, ranging from pure white to a rather deep rose-purple shade, which is far less pleasing than the soft rosy tones and pure white. The single examples of this species show its value for the garden, but we especially draw attention to its value for forming hedges.

One of the more important plants in flower in July was *Gentiana asclepiadea*, which is not sufficiently planted in gardens. It is a very fine species, loves a rather moist spot, and is not averse to a little shade. When perfectly at home as at Wisley it is remarkably beautiful, the vigorous stems clothed

with rich purple flowers; but these vary in shade, and the white variety is useful for sake of contrast. A large break of this fine *Gentiana* is very striking, and the flowers remain in beauty over a fairly long season. In full beauty also was a group of the hybrid *Gladiolus Nanceianus*, which have splendid flowers for size and colour. This hybrid is the result of a cross effected between *G. Saundersii* and *G. Lemoinei*, and the flowers are of remarkable size. One kind named *President Carnot* was especially brilliant, the flowers quite 7 inches across, and bright scarlet, the lower segments straw colour; a few plants of this in full beauty would make an effective display. *Campanula grandiflora Mariesi*, which was certificated by the Royal Horticultural Society on July 25, was in full bloom. It is not often one sees this fine plant well grown, but no great difficulty is experienced in its cultivation, and the large purple flowers are in beauty when most appreciated, in late July and throughout August.

Many hardy plants and shrubs were in bloom besides those mentioned. This garden is rich in *Hypericum*, and *H. oblongifolium* was remarkably beautiful. It is a little tender, and that may be the cause of its comparative scarcity; but in such a place as this, where sheltered by surrounding woodland, it makes luxuriant growth. The habit of the shrub is graceful, and the flowers large, and rich golden-yellow in colour. Another kind noted was *H. Moseriaum*, which is a hybrid between *H. calycinum* and *H. patulum*; it is dwarf, fairly vigorous, and has large yellow flowers. *Tropaeolum speciosum* was beautiful, sending its racemes of scarlet flowers through a hedge; and the *Eryngiums* made distinct effect in colour. One patch of *Gentiana acaulis*, which grows like a weed at Wisley, had 510 of its rich blue flowers open at one time. This is the kind of gardening that greets the visitor to Wisley. *Visitor.*

SOCIETIES.

ROYAL HORTICULTURAL Scientific Committee.

JULY 25.—Present: Dr. H. Müller, in the Chair; Dr. Russell, Dr. Scott, Rev. W. Wilks, Dr. Bonavia, Rev. G. Henslow (hon. sec.), and Mr. W. Sykes (visitor).

Dianthus sp., &c.—Dr. Müller showed a specimen of a Pink from Val d'Anniviers in the Rhone Valley. It was referred to Mr. F. N. Williams for identification, and proved to be *Dianthus prolifera*, *L.* He also exhibited an "Edelweiss" from Mount Cook, New Zealand. Though the inflorescence bore much resemblance to the European form, the foliage was quite distinct, the leaves being obovate, and one-quarter of an inch in length. It was referred to Kew for identification. He also exhibited a Peach, apparently attacked by fungi. It was also referred to Kew for investigation.

Five-leaved Clover—Dr. Bonavia showed a specimen of this tolerably well-known form from garden culture.

Preserving Fresh Ripe Fruit.—Mr. W. Sykes, of Woodleigh, East Dulwich, described some methods for preserving fruit in tins and otherwise, the air being exhausted from the tins. The following is the description of Tomatos:—"The fruit was quite ripe and perfect; after seven days they had not altered, and kept two or three days after being exposed to the atmosphere. After fourteen days the fruit showed signs of 'sweating.' They kept the same time exposed and ate all right. After twenty-one days there was considerable sweating, after thirty days more so, after thirty-seven days still more, the juice draining out badly. The fruit throughout never lost its bright brilliant colour." A discussion arose as to the advisability of adopting the plan of exhausting the tins of air. Both Dr. Muller and Dr. Russell were of the opinion that this method was unadvisable, inasmuch as the vacuum can never be perfect, and it tended to expand the cells, and so by rupturing the tissues, "sweating" would increase. Another method described was to bury the fruit like Potatos or Mangels:—"Apples buried straight from the trees in heaps like Potatos, surrounded by straw and covered with earth a few inches thick, keep well into the following year. Nonpareil, a very astringent, bright-coloured, and bad keeper, loses neither colour nor flavour after being buried. Similarly Peas in

jars, covered over with a bladder and buried, were quite "fresh" at Christmas. In these and similar cases it appears to be the carbonic acid evolved by respiration of the fruit which acts as a preservative by driving away the air from the enclosed space. This tends to destroy, or at least hinder, the fermentive or putrefactive action of bacteria. Mr. Sykes hopes to communicate further results from experiments with this year's fruit.

Pelargonium ignescens, β sterile.—Mr. Henslow exhibited a specimen of this plant found in a cottage garden at Zeals, Dorset. On referring to Sweet's "Geraniaceae" it appears to have been raised from the seed of *P. fulgidum* by Sir R. C. Hoare. Another seedling of the same species was *P. acutillana*. Though called "hybrids," the parentage is unknown. The word "sterile" refers to the anthers being devoid of pollen. *P. ignescens* (proper), as well as the above, are all figured by Sweet, *op. cit.*, viz., *P. ignescens*, vol. i., No. 2; *P. ign. β sterile*, i. 55; *P. sciat.*, i. 28; and *P. fulgidum*, i. 69. The date given is 1821.

"Shaky" Ash wood.—Messrs. Holland & Holland of Oxford Street forwarded a remarkable specimen of the peculiarity known as "shaky timber" among carpenters. On splitting the wood, a central portion separates from the surrounding layers. It is probably due to some seasonal influence when the cambium formed an imperfect and easily separable layer.

AUGUST 8.—There was a very fine show of flowers and fruit at the Drill Hall, James' Street, Westminster, on Tuesday last. Orchids alone being poorly represented. The meeting being held on the day following Bank Holiday, such a display was more than equal to what might have been anticipated.

Floral Committee.

Present: W. Marshall, Esq., in the chair, and Messrs. J. Fraser, J. Laing, H. Herbst, J. Budde, R. Dean, G. Stevens, C. F. Bause, J. Jennings, H. B. May, T. Godfrey, Harry Turner, G. Paul, W. Bain, C. E. Shea, J. T. Bennett-Poë, T. Baines, H. Cannell, G. Gordon, P. Barr, and R. Owen. Several members of a Dutch Horticultural Society were present.

Messrs. John Laing & Sons, Forest Hill, S.E., had a fine group of ornamental foliage and miscellaneous plants, including well-coloured Crotons, finely-grown Caladiums, some plants of *Beaufortia speciosa*, &c. *Caladium* President de la Devansaye was given an Award of Merit. It is one of the smaller leaved varieties, and self-coloured, a coral red. A similar award was given to *Begonia semperflorens*, var. *Vernon*, shown in a group, and apparently a good bedder. The flowers are red, and the foliage reddish tinted, and the habit very dwarf. Another plant included in the group was *Babingtonia camphorosme*, a very old garden plant, but one seldom seen. It belongs to Myrtaceæ, and is a greenhouse shrub, producing pinkish-white flowers in cymes, on terminal racemes. It has a scent similar to camphor. *Dracæna Alexander* was equally successful, and it is a useful variety. A First-class Certificate was awarded to *Gravillea Banksii*, a pretty species, producing red flowers.

From Messrs. Dobbie & Co., Rothesay, N.B., came a large collection of excellent border Carnation blooms, in very fine variety, also some Sweet Peas in variety. Silver Flora Medal.

Messrs. Paul & Son, Cheshunt, were awarded a Silver Flora Medal for a collection of cut Roses, Herbaceous plants, and flowers, &c. *Liatria pycnostachya* was awarded a First-class Certificate, although an old and fine plant it had not been previously certificated. It is a hardy perennial herb, and produces its pale purple flower heads in a cylindrical spike about $1\frac{1}{2}$ foot long.

Awards of Merit were recommended to *Tritoma* (Siris), a yellow one of the same size and habit as the *T. Matador*; the yellow one is very pretty; also to a pretty variety of *Phlox* called *Etna*: the flowers are rich rosy-pink, about 1 inch across; very lovely. Another plant of interest was *Clematis Davidiana*; it is an erect shrub with small pale blue flowers, producing freely from the axils of the leaves, and very sweet-scented. A large bunch of *Tropæolum speciosum* was very bright.

A plant of *Primula Poissoni* in flower was sent by Mr. G. F. Wilson, Weybridge and Wisley; flowers are light mauve.

Cannas were exhibited by several nurserymen and amateurs, in response to the invitation in the schedule, and to illustrate the lecture delivered by Mr. J.

G. Baker in the afternoon. Herr William Pützer, Stuttgart, Germany, obtained an award of merit for a variety called *Königin Charlotte*. It has large leaves, is about $1\frac{1}{2}$ foot high, and the stamens are very broad, scarlet with yellow edging. Messrs. Vilmorin, Andrieux, & Co., 4 Quai Méglisserie, Paris, showed *Canna Lohengrin*, a very fine orange scarlet of good substance, and showy flower (Award of Merit). *Gloire de l'Impératrice*, a bright crimson, very large staminode, but perhaps of less substance than the other (Award of Merit), also President Carnot, a crimson of slightly duller tint, and rather loose in habit (Award of Merit). M. Lemoine, Nancy, had *Canna Capitaine de Luzzoni*, with yellow flowers having markings of pale red (Award of Merit).

An excellent variety called *Michelet* was shown by Sir Trevor Lawrence, Burford, Dorking, together with a collection; flowers are rosy-crimson, very showy (Award of Merit and Silver Banksian Medal).

Hedera Helix tessellata was shown by Miss Browning Hall, Algiers. The younger leaves are prettily variegated with yellow, but this is not so noticeable in the older ones (Award of Merit).

Messrs. Webb & Brand, Saffron Walden, showed some blooms of *Hollyhock Amaranthe*. It is an excellent florists' flower, of deep pink, large and full (Award of Merit).

A First class Certificate was awarded to *Montbretia crocosmiaflora* fl.-pl., or more properly to *Crococsmia aurea* fl.-pl., shown by Sir Trevor Lawrence. In habit it is the same as the species, but the flowers are double, and it will be useful.

The display made by Messrs. Kelway & Sons, Nurserymen, of Langport, Somersetshire, was a large and excellent one, consisting as it did of more than one hundred spikes of *Gladiolus* of the finest varieties; a stand of *Canna* blooms, a collection of *Gaillardias*, single-flowered, and some with fluted florets, like *G. Lorenziana*; and bunches of hardy flowers in a few kinds. The finest of the *Gladiolus* were *Grover Cleveland*, rosy-crimson, each segment furnished with a narrow white stripe in the middle, and blotched with white; *Arthur Henderson*, a fine dense spike, of much more than average length, and furnished with magnificent blooms of a rich carmine colour, with what looks like purple haze in the tube—it is the finest of this shade of colour; *John Warren* is a salmon-red flower, with a purplish-crimson blotch on the lower segment, and this part of the flower is of a more vivid tint than the remainder, a fine flower. These three received an Award of Merit. Others of fair quality were:—*Leonard Kelway*, a fine dark flower; *Rev. H. H. D'ombrain*, a nice pink and white one; *Andromeda*, a cream, flaked with crimson, novel and distinct; *Marciana*, of vivid crimson; *Bona*, a very compact spike of scarlet blooms; *Mrs. D'ombrain*, an excellent white variety; *Hermion*, a fawn-tinted flower, with a leaning to salmon-red; and *J. C. Vaughan*, of flesh colour, with a purple shade.

Of the *Cannas*, two were granted Awards of Merit, viz., *Duchess of York*, a large yellow flower, with crimson spottings; and *Duke of York*, scarlet, irregularly bordered with yellow, very pretty and showy. A Silver-gilt Banksian Medal was the award for the group.

Amongst the cut blooms we noted a fine species of *Veronica longifolia subsessilis*; large spikes of a rich dark shade of blue.

Messrs. De Rothschild, Gunnersbury House, Acton, gr. Mr. J. Hudson, contributed a very fine group of *Campanula pyramidalis*, chiefly the blue-flowered species. The plants were tall, healthy, and well flowered, making them very highly decorative subjects. A Silver-gilt Banksian medal.

From Mr. Thomas Ware, Hale Farm, Tottenham, came a small lot of hardy flowers, and amongst them were *Milla bifolia*, *Lilium Ukeyuri*, a form of *L. longiflorum*; *Cactus Dahlias Mrs. A. Pearl*, white, and *Ernest Metz*, of rich purple colour.

Mr. G. Wythes, Sion House, showed cut blooms and foliage of *Cunonia capensis*, a stove shrub with axillary terminal racemes of white flowers; and a *Cactus* with large white flowers, said to be *Cereus hexagonus*; unfortunately the exhibitor had not brought any of the growths, and the name could not be determined.

From Mr. C. F. Bause, Morland Nurseries, South Norwood, came *Croton Madame Ernest Bergmann*, a handsome simple leaf, marbled with orange and green; *Dracæna Alexander Laing*, a narrowish-leaved variety, with colour resembling that of *D. terminalis*, but with longer and more arching leaves than that variety. Both of the foregoing received an Award of Merit, as did *Caladium* President de la Devansaye, a variety of dwarf habit as seen, and blood-red leaves.

Cut blooms of showy orange-coloured single-flowered tuberous-rooted *Begonia* came from Messrs. H. Cannell & Sons, Swanley; also single and double flowered varieties including the white *Octavie*; several *Chrysanthemums* of merit, perhaps, for their earliness; and a quantity of Tom Thumb varieties of *Antirrhinums* (Silver Flora Medal).

Messrs. Paul & Sons, The Old Nurseries, Cheshunt, had a mixed group of hardy flowers, and we observed *Clethra spinosa*, a dwarf species, and *C. alnifolia*, with which to compare it, several varieties of *Rosa polyantha*, as *Clothilde Souper* and *Camille Rochadelle*, H.P. La France, Madame V. Verdier, and box of cut *Roses*, of which the best blooms were *Captain Christy*, *Duke of Teck*, and *La France* (a Silver Flora Medal).

Mr. C. Holden, 61, Harwich Road, Ealing, showed a small lot of stove and greenhouse plants, amongst them the good outdoor-bedding *Coleus Distinction*, with foliage of the tint of *Perilla nankinensis*. It is a plant that remains of one uniform dwarf character all through the summer.

From Messrs. E. D. Shuttleworth's nurseries, Peckham Rye, S.E., and Fleet, Hants, came cut *Roses*, *Gladiolus* varieties of the *Colvilli* section, some very choice *Phloxes*, *Pentstemons*, *Petunias* with variegated leaves; *Scabiosa caucasica* var. *grandiflora*, light blue in colour, and a good thing if constant as regards the size and form of bloom. A *Carnation* of an unusual shade of orange colour was shown by Mr. F. Ball, Wormingford, Colchester.

Messrs. J. Cheal & Sons, nurserymen, Crawley, exhibited dwarf *Antirrhinums*, some good *Pentstemons*, a quantity of *Dahlias* as cut blooms, of all sections of the *Dahlia*—show, fancy, decorative, *Pompone* and *Cactus*, and a quantity of very vigorous *Sweet Peas*, remarkable for the length and strength of the flower-stalks.

Orchid Committee.

Present: Dr. Maxwell T. Masters, F.R.S., in the chair; Jas. O'Brien (Sec.), Sydney Courtauld, T. Statter, F. Sander, J. Douglas, E. Hill, Hugh Low, H. M. Pollett, and W. H. White.

Sir Trevor Lawrence, Bart., Burford, Dorking, grower Mr. W. H. White, staged a small group of rare Orchids, for which a Silver Banksian Medal was awarded. It consisted of *Lælio-Cattleya* × *Philbrickiana* (*Cattleya Aclandiae* × *Lælia elegans*), *Lælio-Cattleya* × *Blessensis* (*L. pumila* × *C. Loddigei*), *Miltonia spectabilis*, a fine variety, with four large flowers; the very pretty *Aganisia ionoptera* (Botanical Certificate); *Cypripedium* × *Harrieffroyæ* (*Harrieffroyæ* × *Godefroyæ*), and which in its large pale flowers much resembled *C. × Mrs. Canham*; *C. × Euo-superbiens* (*Euanthum × superbiens*), a very fine hybrid, somewhat resembling *C. × Pollettianum*. The whole flower has a shining surface. The flat upper sepal is greenish at the base, spotted with chocolate, which in the upper portion merges into a rosy-purple hue, the whole being margined with white; the lip and petals were tinged with rose (Award of Merit). A spike of the very beautiful *Schomburgkia Lyonii*, another of *Lælio-Cattleya elegans*, *Purple Prince*, four noble sprays of *Aërides Sanderianum*, and a flower of *Sobralia Warscewiczii* were included.

Messrs. F. Sander & Co. also secured a Silver Banksian Medal for a group of rare Orchids, among which were *Cypripedium* × *Thayerianum* (*Lawrenceanum* × *Boxalli atratum*) a very fine and richly-coloured hybrid (Award of Merit), *C. × Macfarlanei* (*calophyllum* × *Spicerianum*), *C. × Youngianum* (*philippense* × *superbiens*), the beautiful violet and mauve *Calanthe Sanderiana*, by far the best of the *Veratrum*-leaved *Calanthes*; fine plants of *Aërides Sanderianum*, the curious *Grobya Amherstiae*, *Vanda Sanderiana*, several *Cattleya Gaskelliana*, one of them having white sepals and petals; *Oncidium Kramerii*, *Grammatophyllum Fenzlianum*, *Aërides Ballantinei aureum*, &c.

W. Thompson, Esq., Walton Grange, Stone, Staffordshire (gr. Mr. W. Stevens), showed a spike of a fine new form of *Lælia tenebrosa* named *L. t.* Walton Grange var. (see p. 179), in which the sepals and petals were clear citron-yellow, the labellum purplish-crimson on a white ground (First-class Certificate). Also a spike of *Oncidium spilopterum* (*Bot. Reg.*, xxxi., t. 40), which has been erroneously described and distributed as *O. Saintlegerianum*, and also erroneously placed under *O. Batemanni*, from which it is quite distinct (see *Gardeners' Chronicle*, Jan. 7, 1893, p. 10, and Feb. 25, p. 227).

Major Joicey, Sunningdale Park, Sunningdale (gr., Mr. F. J. Thorne), exhibited a grandly-grown specimen of *Vanda Sanderiana*, for which a Cultural Com-

mendation was awarded; a cut spike of a fine form of *Cattleya granulosa* Schofieldiana, and a very singular and showy natural hybrid *Miltonia*, M. × *Joicyana*, which received a First-class Certificate (see *Gardeners' Chronicle* next issue). T. Statter, Esq., Stood Hall, Whitefield, Manchester (gr., Mr. R. Johnson), showed cut spikes of *Laelio-Cattleya Schilleriana* Johnsonii, one of the finest of its class; and of two varieties of L.-C. elegans of the Turneri section. F. W. Moore, Esq., Royal Botanic Gardens, Glasnevin, Dublin, sent a specimen of *Earina suaveolens*, a curious New Zealand Orchid, in growth like a small Bamboo, and with terminal racemes of small white fragrant flowers (Botanical Certificate). R. J. Measures, Esq., Cambridge Lodge, Camberwell (gr. Mr. H. Chapman), exhibited *Cypripedium* × *Numa superba*, C. × *Youngianum*, and *Masdevallia Lowii*, the last-named an extraordinary species, illustrated in the *Gardeners' Chronicle*, Sept. 6, 1890, from the type-plant in the possession of Sydney Courtauld, Esq., who received a First-class Certificate for it in August of that year. Messrs. Jas. Veitch & Son, Royal Exotic Nursery, King's Road, Chelsea, sent *Lælia* × *Novely* (L. *pumila* Dayana × L. *elegans*), which showed marked improvement since it was last exhibited, and on this occasion was given an Award of Merit; and Mr. Owen Thomas, from the Royal Gardens, Windsor, sent a fine plant of a superb variety of *Rhyncostylis guttata* (Vote of Thanks); and a plant of *Saccolabium Blumei majus* with one fine spike.

Fruit Committee.

Present: J. Lee, Esq., in the chair, and Messrs. W. Wicks, T. J. Saltmarsh, J. Cheal, G. Bunyard, J. Willard, G. Wythes, H. Balderson, Robt. Hogg, F. Q. Lane, Geo. Taber, and J. Hudson.

Messrs. Jas. Veitch & Co., Chelsea, contributed a collection of Fruit, including amongst a good number of Apples, very fine examples of Lord Grosvenor, Red Astrachan, Winter Hawthornden, Warner's King, Grenadier, Worcester Pearmain, and Frogmore Prolific.

Plums were present in about thirty dishes, all of them of good average quality, and excepting one dish of Kirke's, they had all been taken from pyramids in the open. Prince Englebert, Early Transparent Gage, Belle de Louvaine, Belgian Purple, Large Black Imperial, Victoria, Jefferson, Angelina Burdett, Woolston Heath, McLaughlin, were amongst those most noticeable. Some few Pears, Cherries, Raspberries, and orchard-house trees carrying Peaches and Nectarines completed the exhibit (Silver Knightian Medal).

Another fine collection of fruit was from Messrs. J. Cheal & Sons, Lowfield Nurseries, Crawley. Lady Sudeley, Graod Sultan, Worcester Pearmain, Pott's Seedling, Queen, White Astrachan, and Lord Suffield were very good amongst the Apples, and of Pears, Souvenir du Congrès, Beurré Giffard, Clapp's Favourite, and Williams' Bon Chrétien were good. Plums were shown in fifteen varieties, amongst which were Victoria, Cox's Emperor, Oullin's Golden Gage, Prince Englebert, in fine condition. A very pretty collection of ornamental Gourds were also included (Silver Banksian Medal).

Pine Apples were extremely well shown by Mr. R. Nicholas, Castle Hill Gardens, South Molton. There were eleven fruits of large size and excellent quality (Silver Banksian Medal). Several new Melons were shown, and three of them obtained awards of merit. Mr. Geo. Wytbes, gr. to the Duke of Northumberland, Syon House, Brentford, had a green-fleshed Melon called Hero of Isleworth, obtained from Wytbes's Seedling × Syon House. It is a small fruit, very well netted, rather deep flesh, and particularly sweet (Award of Merit). Mr. W. Palmer, Cobden Villas, Andover, had Royal Prince, obtained from Triumph × Hero of Lockinge, a small yellow fruit, slightly netted, light coloured flesh, sweet and full-flavoured (Award of Merit); also County Councilor, from Triumph × Blenheim Orange, a green fruit fairly well netted, flesh high colour, and very firm (Award of Merit). Other Melons came from Mr. Thomas Webster, gr. to R. H. Murray, Esq., Spinfield, Great Marlow, and from F. C. Carr-Gomm, Esq., Farnham Chase, Farnham Royal, Slough (gr. Mr. A. J. Reid); also from Mr. T. W. Lansom, Widworthy Court Gardens, near Honiton, Devon.

Mr. E. Thomas, Maresfield Park, Uckfield, Sussex, showed some fruits of a red-fleshed Peach called Red Dragon. The colour does not enhance their appearance, which was repulsive rather than attractive.

Mr. Owen Thomas, gr. at the Royal Gardens, Windsor, showed twenty-one dishes of Peaches and Nectarines, in as many varieties. Many of these

were represented by large and highly-coloured fruits; such were Stirling Castle, Pine-apple, Hardwicke Seedling, &c.; also a couple of Melons (Silver Banksian Medal).

Messrs. Geo. Bunyard & Co., Maidstone, received a Cultural Commendation for a dish of Lady Sudeley Apple, exceptionally well coloured and pretty, and said to have been produced by poor soil. Several Pears were also shown, such as Reine Giffard, Petite Marguerite, and Précoce de Trevout.

Mr. A. J. Freer, Nelson Road, New Brompton, Kent, had fruits of Tomato Freer's Abundance, a perfectly smooth, good-looking fruit (Vote of Thanks).

Messrs. Jarman & Co., Chard, Somersetshire, had a new Ridge Cucumber, called Baker's Triumph, a large one for such purpose.

Mr. G. H. Mackereth, Ulverston, showed a seedling Potato, George Dickson, described as an excellent cropper, boiler, and disease-resister. It has a clean skin, is nearly round, and has small eyes, but a little deep.

Lecture on Cannas, by Mr. J. G. Baker.

The paper read at the Drill Hall before the members of the Royal Horticultural Society last Tuesday, was by Mr. J. G. Baker on Cannas. He explained first how that in the Scitamineæ the showy, brightly coloured part of the flower consisted not of the flower-wrapper, but of the altered stamens, and that only a single anther instead of six was developed. For the classification and nomenclature of the true species he referred to the paper which appeared in our columns in spring. He said that, from a horticultural point of view there were five types in the genus. Firstly, comparatively dwarf little-branched, true Cannas; secondly, tall true Cannas cultivated for their foliage; thirdly, *Canna edulis* grown for its tubers; fourthly, the monotypic *Eurystylus* type represented by *C. flaccida*; and fifthly, the long-tubed *Achiridia* type represented by *C. iridiflora* and *C. liliflora*. Tracing out the history of the genus he showed that at the present time the pure species have gone out of cultivation and are represented by handsome hybrids.

The great mass of the garden Cannas now grown be traced back to *iridiflora*, crossed with *glauca* and *Warszewiczii*.

Finally, Mr. Baker said that Messrs. Dammann have lately crossed *flaccida* with *iridiflora* and the true Cannas, and have thus produced two hybrid types of new parentage. The paper will be printed in detail in the *Journal of the Horticultural Society*.

SOUTHAMPTON HORTICULTURAL.

AUGUST 5, 7.—The annual summer exhibition was held in the Society's beautiful grounds, Westwood Park, and was a great success horticulturally, and, we trust, financially. This Society has suffered recently, the residents of the town not supporting it as they ought. The arrangements were, as usual, perfect, under the guidance of Mr. Fudge, the energetic secretary, assisted by an efficient committee.

In the great class for ten stove or greenhouse, half foliage, and the remainder flowering, there were four competitors. Mr. F. C. Jennings, gr. to W. Garton, Esq., Roselands, Woolston, was an easy 1st, his plants of *Lantana horbonica* huge of size; *Kentia Fosteriana*, in grand health; *Croton Warneri*, beautifully coloured; while *Stephanotis floribunda*, *Allamanda Hendersoni* and *A. nobilis* were profusely flowered. Mr. T. Wilkins, gr. to Lady Theodora Guest, Inwood House, Blandford, was a good 2nd. The *Crotons* in this exhibit were richly coloured.

Mr. Jennings was again 1st in the class for six specimens; amongst others he staged a wonderfully coloured *Croton angustifolius*; Mr. W. Peel, gr. to Miss Todd, Sidford Lodge, Shirley, 2nd.

Still another class was provided for specimens, but open only to gardeners. Mr. T. Hall, gr. to S. Montague, Esq., M.P., South Stoneham House, Southampton, secured the 1st award; *Eucharis amazonica*, with twenty-seven spikes of bloom in rude health, was noticeable in this collection.

Mr. Ams, gr. to the Hon. Lady Elliott Yorke, Netley, was an easy 1st in the class for a specimen plant in flower, showing a plant of *Allamanda Hendersoniana* fully 7 feet across, and profusely flowered.

Exotic Ferns were really well shown. Mr. Jennings was 1st for six, and Mr. Ams a close 2nd.

Exceedingly dwarf, with large heads of bloom, were the 1st prize Cockcoombs from Mr. E. J. Wilcox, gr. to Lieut.-Col. Silkins, Aldermoor House, Shirley. *Celosias* were a distinct feature, so well were they

grown and flowered by Mr. West, gr. to H. J. Wigram, Esq., Northlands, Salisbury. The specimens of *Colens* were better than usual, Mr. Hall taking 1st prize for six pyramids, brightly coloured. Mr. Blandford, gr. to Mrs. Haselfoot, Bitterne, secured leading prizes for both double and single flowered Zonal *Pelargoniums*. Mr. Wills was 1st for *Begonias*, both double and single-flowered varieties.

Groups arranged for effect were a distinct feature. In the large class Mr. Wilkins led the way with an arrangement that left little to be desired, so well were the plants suited for the purpose, and so effectively arranged. Mr. Wills was a close 2nd.

In the smaller class several meritorious exhibits were to be found. Mr. Peel was placed 1st with a bright yet effective arrangement. Hardy Ferns were well shown by Mr. Busby, gr. to F. Willan, Esq., Thornhill Park, Bitterne, who secured leading honours.

CUT FLOWERS.

These exhibits made a bright display. Messrs. Keynes, Williams & Co., Salisbury, won first award for twenty-four *Roseæ* distinct, with really good blooms. Hardy herbaceous flowers were numerous and well shown. Mr. Ladhams, florist, Shirley, beat his somewhat strong opponent, Mr. Maurice Prichard, Christchurch, Bournemouth, both staging remarkably well. Stove and greenhouse flowers were best shown by Mr. Budd, gr. to F. Dalgety, Esq., Lockerley Hall, Romsey, winning, but Mr. Evans, gr. to Lady Louisa Ashburton, Melchet Court, Romsey, ran close. Dahlias, both show and pompons, were well shown by Messrs. Keynes, Williams, & Co., and Mr. West, who were awarded honours in the order mentioned.

Table decorations, though pretty, were not strikingly good, Mr. B. Ladhams, Shirley, being placed 1st. Messrs. Perkins were invincible both with ball and bridal bouquets. Mr. Ladhams had by far the best epergne decoration.

FRUIT.

This was generally very good. In the class for six dishes, Pine excluded, no fewer than eight persons competed. Mr. Ward, gr. to the Earl of Radnor, Longford Castle, Salisbury, was decidedly ahead of all others with Muscat of Alexandria and Black Hamburg Grapes, Dryden Nectarines, Hero of Lockinge Melon, Brunswick Figs, and Sea Eagle Peaches; Mr. Inglefield, gr. to Sir J. Kelk, Bart., Tedworth, Marlborough, was a most creditable 2nd. For three bunches of black Grapes, Mr. Henbest, gr. to Lady Kenard, Crawley Court, Winchester, won with Black Hamburg, capital in every respect. In the white Grape class, Mr. Molyneux, gr. to W. H. Myers, Esq., M.P., Swanmore Park, Bishop's Waltham, was easily 1st, with Muscat of Alexandria of great size in bunch and berry; Mr. Ward 2nd, with the same variety. Mr. Busby was 1st for two bunches of black Grapes; as were Mr. Henbest for a single bunch of any variety of black Grape, and Mr. Molyneux for any white one, all of these exhibitors staging well.

Melons were a strong class. Mr. Henbest won for scarlet. Mr. Ward 1st for any green-flesh, showing The Bouverie, a charming variety.

Peaches were largely shown. Mr. Inglefield won with handsome fruit of Barrington. Mr. H. Drover, Shanklin, Isle of Wight, staged exceedingly handsome fruit of Pine-apple in the class for a single dish of Nectarines. Mr. Busby was 1st for six dishes of hardy fruits, distinct—a fine exhibit; Mr. Budd 2nd.

VEGETABLES.

as usual, were staged in large numbers, and of excellent quality. For nine distinct varieties there were no fewer than seven competitors. Mr. Wilkins was a somewhat easy 1st, with a collection good all round; Excelsior Onions, Satisfaction Potato, and A I Runner Beans were very fine. Mr. Inglefield was 2nd. Mr. Wilkins won the premier prize award in the class for six varieties, offered by Messrs. Sutton & Sons, Reading, with a similar collection to that staged in the former; Mr. Hughes was 2nd. Mr. West was 1st for eight varieties of Potatoes, as were Mr. Wilkins for a single dish of Kidneys, and Mr. West for Bonnds. Tomatoes were a strong class, and Mr. Ladhams was 1st.

MISCELLANEOUS.

Mr. Rogers, Red Lodge Nurseries, Southampton, staged two splendid groups of shrubs and plants, but not for competition. Messrs. Keynes, Williams & Co., Salisbury, sent a collection of Cactus and Pompon Dahlias.

Mr. Ladhams staged a thoroughly good collection of hardy cut flowers; Mr. J. Miles, gr. to W. N. Perkins, Esq., Portswood, had a somewhat novel exhibit.

Apples (French Crab) and Filberts grown during the years 1891, 1892, and 1893, all being in a good state of preservation.

WELLS HORTICULTURAL.

AUGUST 7.—The summer show of the Floral Society was held in the Palace grounds, Wells, by the permission of the Bishop. Roses, which were numerous and good last year, were sparingly staged. In the class for twenty-four H.P.'s distinct, Messrs. Cooling, nurserymen, Bath, were the only exhibitors, staging rather small but brightly-coloured flowers: Pride of Waltham, Horace Vernet, and Mdme. Gabrielle Luizet being particularly good.

In the class for twelve varieties, distinct, Messrs. Cooling were again 1st, and Mr. Young, gr. to W. S. Hodgkinson, Esq., 2nd.

Groups of plants arranged for effect were asked for, for the first time this year, and six groups were arranged in response. Mr. Fawcett, gr. to C. C. Indway, leading with a beautiful arrangement—Pancratiums, Liliams, brightly-coloured Crotons, and Cocos Weddeliana being conspicuous.

Mr. Williams, gr. to J. F. Hall, Esq., was a good 2nd, having highly-coloured Crotons, Anthuriums, Orchids, &c.

The 1st prize for specimen plants was won by Messrs. Williams, and 2nd by Mr. Fawcett. For two specimen Ferns, Mr. Fawcett was 1st, and Mr. Williams 2nd.

For six table plants Mr. Williams was again 1st, Mr. Young 2nd. Fuchsias, trained plants, were well represented, Mr. Gardner's plants being well worth the 1st award.

Gloxinias, Carnations, and Begonias in pots were sparingly represented. Messrs. Stokes, King, Fawcett, and Marshall being 1st in each respectively.

FRUIT.

This was, as usual at Wells, a very fine show. Melons were a magnificent class, there being not a badly-flavoured fruit among them, and showing how favourable the recent tropical weather has been for them. Mr. Payne led by one or two points, Mr. King being a good 2nd with a much smaller but superbly flavoured fruit.

For two bunches of black Grapes, Mr. Payne, gr. to the Bishop of Bath and Wells, was placed 1st with superb clusters of Alicante; Mr. Fawcett being 2nd, with Black Hamburgs, fine in bunch and berry. In the class for two bunches of white Grapes, Mr. King, gr. to the Dean of Wells, led rather easily with very fine clusters of Muscat of Alexandria, rather under ripe.

Mr. Thyer was 1st for Peaches, Mr. Williams 2nd. Apples, Pears, Cucumbers, and Tomatoes were largely shown and excellent; Messrs. Payne, McKenzie, and Isgar being the prize winners.

Dinner tables laid and decorated for six persons were a feature in the conservatory, which had been cleared for the purpose. 1st, Miss Fyfe, with a chaste arrangement of lightly tinted Rose-buds; 2nd, Mrs. Isgar. The show was a success in every way.

NORTHAMPTON HORTICULTURAL.

AUGUST 7, 8.—This exhibition is yearly increasing in popularity within the district represented by its being held on Bank Holiday and succeeding day; the show is literally thronged with visitors, the grounds of Delapre Park being contiguous to the town of Northampton. It is essentially a show for the masses, the entrance on the first day being only 1s., and on the second 6d. Before six o'clock in the evening of the first day it was estimated that fully 10,000 persons were present in the grounds.

PLANTS.

Stove and greenhouse flowering and fine foliage plants, twelve varieties, are always well represented at this show. On this occasion as before the competition was very keen between Mr. Finch, gr. to J. Marriott, Esq., Coventry, and Mr. Jas. Cypher, Queen's Road Nursery, Cheltenham, the former earning a well deserved victory by the superior quality of his flowering plants; these were *Ixora Williamsii*, a grand specimen, as fine as it has ever been shown, the plant, some 6 feet in height and 5 feet in diameter, carrying an immense number of its large clusters of bloom; with this was a fine plant of *I. amabilis*, nearly as large; a profusely flowered and large plant of *Lapageria rosea*, a fine *Allamanda Hendersonii*, and good examples of *Dipladenia amabilis* and *Erica Irbyana*. The finest of the foliage plants were *Cycas circinalis*, two capital *Kentias*, and the same of *Crotons Warreni* and *Prince of Wales*.

Mr. Cypher was strongest in foliage plants by several points, he having *Croton angustifolius* and *C. Queen Victoria* in the finest possible condition, the first-named quite a fountain of gold. Two fine *Kentias* were staged here also, and an immense plant of *Latania borbonica*; the finest of the flowering plants was *Erica Eweriana*, beautifully coloured, a good plant of *Bougainvillea glabra*, and another of *Allamanda nobilis*. These two groups of twenty-four plants were grand features in the immense circular tent.

In a smaller class for flowering and foliage plants, Mr. Lanchbury, gr. to C. Watkin, Esq., Westfield, Wellingborough, was easily 1st, his finest plants being two immense plants of *Zamia Vroomii* and *Encephalartos Alstensteini*, fully 10 feet in diameter in each case, and more in height, and a very superior plant of *Hamamthus Katherina* with seven large trusses of its deep orange-red flowers. Mr. Holland, gr. to W. Jeffery, Esq., Beaumont Villa, was 2nd with smaller plants, including *Rondeletia speciosa major*, *Euphorbia splendens*, and *Dracena Draco*.

FERNS.

In the Fern class there was a keen competition again, six collections being staged; the best all-round lot was that staged by Mr. Holland, which included two finely-grown *Gymnogrammas*, and equally as good *Adiantums* (*A. cuneatum* and *A. Farleyense*); Mr. Lanchbury followed very closely with first-rate examples of *Davallia filijensis plumosa*, *Adiantum trapeziforme*, *A. Owenii*, and *A. concinnum latum*.

Fuchsias.—The best were staged by Mr. Beard, Great Brington; Mr. Kightley, gr. to Sir H. Wake, Courteen Hall, being a good 2nd. *Coleus* in good variety were best from Mr. Copson, gr. to Mrs. Phipps, Collingtree Grange, who had plants of pyramidal growth.

GROUPS.

Mr. Jas. Cypher was 1st with a beautifully arranged group (space 20 feet by 12 feet), facing all ways. The leading design being a central mound in which *Phoenix ruppicola* was the chief feature, four smaller mounds occurring towards each corner, where *Cocos Weddeliaoa* and *Areca lutescens* played important parts; the groundwork was *Maidenhair Ferns*, amongst which were dotted here and there small plants of *Orchids*, such as *Oncidium Kramerii*, *O. flexuosum*, and *Odontoglossum Harryanum*, with several nice pieces of *Cattleyas*. Small *Crotons* were also used with good effect, so were little plants of *Francoa ramosa*. Messrs. Thomas Perkins & Sons were a good 2nd in this class, *Liliums* and light plants of *Crotons* being used with good effect.

In the amateur's class for a group of similar size Mr. Holland was 1st with a light arrangement, such palms as *Cocos Weddeliana* and *Phoenix ruppicola*, with *Dracena gracilis*, being tastefully employed; *Orchids*, *Pancratiums*, and *Liliums* being prominent flowering plants.

Tuberous Begonias were shown best by Mr. Holland, and table plants by Mr. Pearce, gr. to S. Loder, Esq., Floore House, Weedon; Mr. Cole, gr. to Earl Spencer, Althorpe, following in the latter class. *Cockscombs* were exhibited remarkably well by Mr. Mackinlay, gr. to Sir C. Isham, Lamport Hall, dwarfier plants from Mr. Copson being placed 2nd.

CUT FLOWERS.

For an arrangement for the dinner table, combined with dessert, Mr. Cypher was 1st with a tasteful arrangement, the central stand being the leading feature: *Orchids*, *Ixoras*, and *Dipladenias*, with *Francoa ramosa*, being the principal flowers therein. Mr. Vause, Milverton Nurseries, Leamington, was 2nd: but this exhibit lacked finish.

The *Roses* were good, considering the season, Messrs. John Perkins & Son were 1st for twenty-four blooms; these were fresh, bright, and of average size. Mr. Bennett, gr. to Rev. W. H. Jackson, Stagsden Vicarage, Bedford, was a near 2nd, but was placed 1st for a good box of Tea-scented with bright flowers; Messrs. Thos. Perkins & Sons coming in a capital 2nd.

Mr. Finch had by far the best box of cut flowers in the open class, showing strongly with such good things as *Erica aristella*, *E. Fairriana*, *E. insignis*, with *Ixoras*, *Dipladenias*, and *Allamandas*. Messrs. Thos. Perkins & Sons were 2nd with a fresh but much smaller exhibit.

In another class Mr. Kightley was 1st with large bunches of useful everyday stove and greenhouse flowers, *Eucharis Mastersii* and *Bignonia jasminoides* being included. The same exhibitor was 1st for hardy border flowers with a good assortment of things in season. The best bouquets were both from Mr. Cole,

one exhibitor who showed well not having noted the wording of the schedule carefully.

FRUIT.

This part of the show was excellent. Mr. Goodacre, Elvaaston Castle Gardens, Derby, was 1st for a collection of eight dishes, the finest among which were *Muscat Hambro' Grapes*, uncommonly good and well coloured, with capital *Muscat of Alexandria*, a fair *Queen Pine*, and fine dishes of *Peaches* and *Nectarines*, as well as *Williams' Bon Chrétien Pears*. Mr. Birch, gr. to Marquis of Northampton, Castle Abby, was a near 2nd, his best exhibits being splendid examples of *Madresfield Court Grapes* and *Sea Eagle Peaches*, with a good *Melon*, "The Countess." Mr. Cole came also very near for 3rd place in this class.

For six dishes Mr. Mackinlay was 1st, *Gros Maroc Grapes* and *Dr. Hogg Peaches* being the best dishes.

Mr. Birch was a splendid 1st for *Black Hamburg*, with large bunches with medium-size berries, but as black as *Sloes*; Mr. Copson was 2nd with larger berries not so well coloured.

Mr. Jordan, gr. to Viscount Clifden, Holdenby House, was 1st with *White Grapes*, *Muscat of Alexandria*, fine in bunch, berry, and colour being the variety; the next best being *Foster's Seedling*, from Mr. Alexander, gr. to Messrs. Westley & Sons, Busworth.

The best *Peaches* and *Nectarines* were shown by Mr. Pearce, *Royal George* and *Pine Apple* being the varieties.

VEGETABLES.

In the two classes for collections the competition was intensely keen, but few points separating the most successful exhibitors. Mr. Copson was 1st for twelve varieties; his finest dishes were the *Tomatoes*, *Carrots*, *Celery*, *Autocrat Peas*, and *Ne plus ultra Runner Beans*. Mr. Kightley was 1st for nine kinds, his best being *Celery*, *Lemon Rocca Onions*, *Snowdrop Potatoes* and *Snowball Turnips*. In each case Mr. Cole was 2nd with first-rate produce, weakening himself somewhat by showing in two classes.

MISCELLANEOUS EXHIBITS

were numerous. Messrs. Thos. Perkins & Sons had a large space filled with fruit trees in pots, bearing good crops, with a large number of good dishes of *Apples* and *Plums* in season, as well as hardy cut flowers in variety, and designs in the forms of a wreath and a harp [!], with bouquets; plants in flower being also included, chiefly good strains of *Tuberous Begonias*. *Onions*, spring-sown, finely grown, came from the same source, staged with their tops upon them, as they should be at this season of the year.

Messrs. John Perkins & Son had a large group of *Roses* in pots in flower, with *Clematis*, &c., and some fine dishes of fruit, chiefly *Apples*, these latter and the *Roses* being particularly good.

In the *Amateurs' classes*, as well as the *Cottagers'*, the produce was of the very best description, evincing the best of cultivation, and that in spite of a season not by any means favourable to vegetables at least.

Another good exhibit here was that of Mr. Clarke, Milton, which comprised finely-grown *black Grapes*, *Tomatoes* and *Cucumbers*, and another from Mr. Cruickshank, of *Peaches* and *Nectarines*, also of *Passiflora edulis* fruit. H.

GARDENING AND FORESTRY EXHIBITION.

AUGUST 9.—A show of foliage plants and hardy flowers, &c., was held at Earl's Court on Wednesday. There was but little competition, though with a large number of uncompetitive exhibits the tent was well-filled.

The first class for a group of flowering and foliage plants to occupy a space of 200 square feet was only entered by Messrs. Jno. Laing & Sons, Forest Hill, S.E., but their exhibit was a most praiseworthy one, exceptionally rich in choice plants, both foliage and flowering, and the whole exhibiting good taste in arrangement.

Mr. Geo. Wythes, gr. to the Duke of Northumberland, Syon House, Brentford, was 1st in the group arranged for effect by amateurs on space 100 feet square. The group was composed chiefly of foliage plants, and would have been brighter had a little more flower been included. A nice lot of young *Dracenas* were noticeable.

For a group of *Liliums* in pots, the prize went to Mr. Chas. Turner, The Royal Nurseries, Slough,

whose plants were good, and for the most part were varieties of *L. lancifolium*.

Mr. W. Home, gr. to J. Tate, Esq., Park Hill, Streatham Common, was 1st for a group of Crotons and Dracenas upon a space of 72 feet. The whole of the plants were well grown, but the Crotons might have been more highly coloured, and to advantage.

CUT FLOWERS.

The 1st prize for a group of hardy flowers, arranged on the ground for effect in a space 100 square feet (open), was taken by Messrs. Paul & Sons, Cheshunt, for a very excellent collection, including a good number of varieties, and in fine condition.

For a similar group arranged on fifty square feet by amateurs, the 1st prize was taken by Mr. Geo. Wythea. Twenty-four bunches of hardy flowers, distinct (open), were beat shown by Messrs. Paul & Sons, Cheshunt. Their Phloxes, Helianthus, and Gaillardias were excellent.

Mr. M. Cuthbertson, Rothesay, Scotland, was a first-rate 2nd here, his flowers were very fresh.

In the amateur division the 1st prize was taken by Mr. A. Newell, gr. to Sir E. Saunders, Fairlawn, Wimbledon, for a very creditable collection.

FRUIT.

There was only one class for fruit, and in this was included six dishes. The competition was good, and the 1st place was taken by Mr. Wythea, who showed Morello Cherries, Royal George Peach, Williams' Bon Chrétien Pear, Pine-apple Nectarines, Worcester Pearmain Apple, and Jefferson Plum; Mr. G. H. Sage was 2nd, and included in his collection a dish of excellent Mulberries; Mr. A. Hester, gr. to W. G. Dawson, Esq., The Links, Plumstead Common, was 3d.

MISCELLANEOUS.

These were numerous, and formed at least an equal part of the whole.

Messrs. Barr & Son, Covent Garden, took up the whole of one end with a collection of hardy flowers in extensive variety.

Messrs. Kelway, Langport, Somerset, had their group of *Gladiolus*, &c., noticed at the show at the Drill Hall on the previous day; and Messrs. J. Cheal & Sons, Lowfield Nurseries, Crawley, staged their collection of fruits noticed at the same time and place, also a collection of Sweet Peas, Dahlias, &c. Mr. J. Walker, Thame, Oxon, had a collection of Dahlia blooms, and Mr. Jno. Forbes, Hawick, Scotland, a collection of East Lothian Stocks, and some very fine Hollyhocks. Messrs. W. Barron & Son, Elvaston Nurseries, Borrowash, Derby, had sprays of ornamental deciduous trees, and Mr. M. Cuthbertson, Rothesay, Scotland, a large collection of hardy flowers.

Messrs. S. Spooner & Sons, Honnslow Nurseries, Middlesex, staged a nice collection of Apples. Lady Sudeley was shown in first-rate condition, as were many others.

Mr. J. Hudson, gr. to Messrs. Rothschild, at Gunnersbury House, Acton, had a group of Camranulas, and the excellent Pine Apples from Mr. R. Nicholas noticed at the Drill Hall were here also.

A choice collection of fruit was staged by Mr. J. T. Hoar, gr. to T. J. Cooper, Esq., The Grange, West Moulsey; the collection was very representative.

Messrs. Alex. Cross & Sons, 19, Hope Street, Glasgow, and 79, Mark Lane, London, had a stand of Cross's Fertiliser, and Murray's Electric Mildew and Insect Destroyer.

Mr. E. F. Such, Maidenhead, had a good collection of hardy flowers, and Mr. T. A. Hester a collection of fruit.

Obituary.

THOMAS LAXTON.—We regret to record the death of Thomas Laxton, of the Girtford and Kimbolton Nurseries, Sandy and Bedford, which took place on Sunday, August 6, in the sixty-third year of his age. Mr. Laxton will be best known to the gardening fraternity for his successes in raising new varieties of Peas, Runner Beans, and Strawberries, some of these having become almost indispensable in good gardens. Of Peas, we may name Supreme, Prolific, Superlative, William I., Fillbasket, Omega, Supplanter, Unique, Dr. Hogg, and Connoisseur; of Beans, Girtford Giant; of Strawberries, Noble, John Ruskin, Sensation, Scarlet Queen, Latest of All,

Commander, La France, Cardinal, and Laxton's No. 1, the earliest of all Strawberries.

Most of the above of Laxton's raising are of so much excellence, that they are certain to form the best memorial of him for many years to come.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

- 10, Ireland, S.;
- * Channel Islands.

THE PAST WEEK.

The following summary record of the weather for the week ending August 5, is furnished from the Meteorological Office:—

"The weather was again unsettled and changeable, and at times rainy in all parts of the kingdom. Thunderstorms were very prevalent over the east and north-east of England towards the end of the period, and the rainfall in those regions was heavy.

"The temperature was slightly above the mean in 'Ireland, S.,' and just equalled it over the western parts of England and the Channel Islands. In all other districts there was a slight deficit. The highest of the maxima were recorded at most stations either on the 3rd or 4th, and ranged from 74° in 'England, S.,' and 73° in the 'Midland Counties,' 'England, S.W.,' and the 'Channel Islands,' to 66° in 'Scotland, N.' The lowest of the minima were registered on August 1, when the thermometer fell to 40° in 'Scotland, N. and E.' and the 'Midland Counties,' to 41° in 'Ireland, N.,' 42° in 'Scotland, W.' and the 'Midland Counties,' and to between 45° and 49° in most other districts; in the 'Channel Islands,' however, the lowest reading was 56°.

"The rainfall exceeded the mean in nearly all districts, but just equalled it in the 'Channel Islands,' and was rather less in 'Scotland, W.' and 'England, N.W.' In 'England, N.E. and E.' the excess was very considerable.

"The bright sunshine was less than the normal in most of the 'Wheat producing,' while it was somewhat in excess in the majority of the 'grazing' districts. The percentage of the possible duration ranged from 16 in 'Scotland, N.,' to between 34 and 44 in most other districts, to 50 in 'England, S.W.,' and to 72 in the 'Channel Islands.'"

MARKETS.

COVENT GARDEN, August 10.

[We cannot accept any editorial responsibility for the eubjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day. Ed.]

MARKET heavily supplied with all classes of goods, prices being practically ruled by buyer. James Webber, Wholesale Apple Market.

POTATOES.

Supplies still continue heavy, and prices lower, except for fine samples, Snowdrops and Hebrons, which realise 6s. 6d. to 7s.; other kinds, 4s. to 5s. 6d.; ordinary, 3s. to 3s. 6d. J. B. Thomas.

SEEDS.

LONDON: August 9.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., write that, as might be expected, to-day's market was but thinly attended, with but little business done. New Trifolium meets a quiet but steady inquiry, at last week's figures. There is a good demand for new winter Tares, at current quotations. In Giant Seed Rye there is a ready sale. White Mustard Seed, which continues very dear, is still inquired for. Canary seed, which of late has been rather dull, moves off slowly on former terms. Peas and Haricot Beans dull. Choice new Rapeseed is now obtainable on moderate terms. Hempseed is quiet but firm. The Board of Trade returns give the imports of Clover and Grass Seed into the United Kingdom for last month as 10,749 cwt., value £25,110, as against 4,127 cwt., value £5,416, for the corresponding period of 1892.

FRUITS AND VEGETABLES.

BOROUGH: August 8.—Quotations:—Cabbages, 3s. 6d. to 6s. per tally; Parsley, 1s. 6d.; Carrots, 2s. 6d. to 4s.; Turnips, 2s. 6d. to 4s. per dozen bunches; Onions, Egyptian, 5s. 6d. to 6s. per cwt.; Plums, 3s. to 5s. per half-sieve.
